To develop a simple homodyne system for the measurement of the complex dielectric constant of lossy materials at microwave frequencies. Relevance - this work potentially can lead to development of a nondestructive soil moisture measurement system since the dielectric constant of soils varies as a function of moisture content. Soil moisture is a fundamental parameter in hydrologic forecasting and was identified as a needed research area at the recent Military Hydrology Workshop. Wes has further identified this as a possible 'ground truthing' system for remotely sensed (aircraft or satellite) data.

Two techniques will be evaluated. In the first, a wave is propagated at right angles into the medium in which a modulated scatterer has been emplaced, thus allowing measurement of the complex plane wave propagation constant. The second technique involves guiding a transmission line mode along the air-medium interface using a bare ribbon conductor.

5.0001, CONTINUATION OF THE OPERATION OF THE IMS ALASKAN CHAIN OF MAGNETOMETERS, ALL-SKY CAMERAS AND RIOMETERS

G.J. Romick, University of Alaska, Fairbanks Campus, Geophysical Inst., *Fairbanks, Alaska* 99701 (ATM78-25479)

The International Magnetospheric Study (IMS) is an international program designed to increase our knowledge of the morphology and dynamics of the plasma surrounding the earth. This program, started in 1976, is scheduled to continue in the data gathering phase through 1979. The United States' participation in the program features satellite transmission of magnetometer and riometer data from remote stations. All-sky cameras also operate at many of these stations. The Geophysical Institute was funded in 1976 to install and operate a chain of high-latitude stations in Alaska and northern Canada. The complete chain has only recently become fully operational and includes Canadian stations at Eureka, Johnson Point, Sachs Harbor, Cape Perry, Inuvik, and Alaskan stations at Arctic Village, Ft. Yukon, Poker Flat, College and Talkeeta.

This grant supplies funding to continue this data-gathering operational program through the end of 1979 with the possible extension into 1980.

5.0002, MERCURY GEOLOGIC MAPPING

H.E. Holt, U.S. Dept. of the Interior, Geological Survey, Geologic Division, *601 E. Cedar Ave., Flagstaff, Arizona* 86001 (9580-01856)

The overall objective of this project is the publication of a Geologic Atlas of Mercury composed of all or parts of 9 quadrangle maps at a scale of 1:5,000,000. Geologic mapping is based on the photographic data returned by Mariner 10 during its flybys of the planet Mercury in 1974-75. The procedure of analysis involves dividing the surface rocks into geologic units and mapping their distribution. The surface of Mercury records successive events that modified surficial distributions of materials; events resulting from internal processes such as volcanism and tectonism, as well as the external mechanism of meteorite impact. The resulting geologic maps will depict the stratigraphy and structure of the surface materials from which the sequence and nature of the major events that have affected the planetary surface can be recognized. A geologic and tectonic evolution of Mercury will be derived from the resulting geologic mapping.

5.0003, PHOTOGRAMMETRY

S.S. Wu, U.S. Dept. of the Interior, Geological Survey, Astrogeologic Studies Branch, *601 E. Cedar Ave., Flagstaff, Arizona* 86001 (9580-00992)

The objective of the photogrammetry project is to conduct research, develop and apply new photogrammetric technology to specialized spacecraft data reduction problems for the derivation of surface topography, on local and global scales of extraterrestrial planetary bodies. Spacecraft imaging systems include optical, radar wavelength and other remote sensing devices. Research involves development of both hardware and software for photogrammetric plotter systems.

By using their gravity fields, a topographic datum of Mars and the Moon is redefined. By synthesizing imaging and nonimaging data, global maps of Mars and the Moon are to be compiled and continuously enhanced. Using high resolution Viking photographs, detailed topographic contour maps of features of scientific interest on the martian surface will be compiled.

For the Venus mission and other future planetary mission flights, mapping technology using side-looking radar imagery will be developed from the investigation of this project.

SUPPORTED BY U.S. Dept. of the Interior, Geological
Survey, Geologic Div.

5.0004, GEOLOGIC MAPS OF MARS, 1:15 MILLION SCALE

D.H. Scott, U.S. Dept. of the Interior, Geological Survey, Geologic Div., *2255 N. Gemini Dr., Flagstaff, Arizona* 86001 (9580-02365)

This project will be a joint effort between geologists of the U.S. Geological Survey and those from several universities. Initially the geology will be mapped on transparent overlays to Viking orbital photos or subquadrangle photomosaics (scale 1:1.25M and 1:2M). Compilation of data will be made on stable-base cronaflex or cronapaque copies of the 1:15 million scale base map to be provided by the Flagstaff Cartographic Section. The map will consist of 5 sheets (4 Mercator equatorial sheets, 1 polar stereographic sheet including both poles). Geologic map-

ping will be started during October 1978 in the north polar and southwestern equatorial regions.

SUPPORTED BY U.S. Dept. of the Interior, Geological Survey, Geologic Div.

5.0005, SEASAT-A SATELLITE - EASTERN PACIFIC TUNA FISHERIES EXPERIMENT

R.M. Laurs, U.S. Dept. of Commerce, National Oceanic & Atmospheric Admin., National Marine Fisheries Service, Southwest Fisheries Center, *P.O. Box 271, La Jolla, California* 92037 (SWC-903)

This is a demonstration experiment to evaluate the utility of ocean and weather products derived from SEASAT-A satellite measurements to Eastern Pacific Tuna Fisheries. The original objectives of the Eastern Pacific Tuna Fishery SEASAT-A experiment were to 1) evaluate the reliability of existing FAX products against those from SEASAT-A in assisting U.S. tropical tuna fishermen in making tactical fishing decisions; 2) evaluate the utility of SEASAT-A products in assisting U.S. Albacore fishermen in making tactical fishing decisions; (3) evaluate the potential of SEASAT-A products in providing useful information in managing the tropical tuna and albacore tuna fisheries; and 4) evaluate the usefulness of SEASAT-A products to ongoing research in fishery-oceanography in the Eastern Pacific. Because of the premature failure of the SEASAT-A satellite it is necessary to modify the original experimental design and approach. The modifications are pending and could be firm by mid-January 1979.

SUPPORTED BY U.S. Dept. of Commerce, National Marine Fisheries Service, Southwest Fisheries Center

5.0006, ENGINEERING GEOLOGIC STUDIES OF NATIONAL PETROLEUM RESERVE, ALASKA (NPRA)

R. Kachadoorian, U.S. Dept. of the Interior, Geological Survey, Alaskan Branch of Geology, *345 Middlefield Rd., Menlo Park, California* 94025 (9310-01972)

STATE TO WHICH PROJECT PERTAINS: Alaska.

Make engineering geologic investigations to provide necessary geotechnical analyses needed for petroleum exploration of the National Petroleum Reserve, Alaska. Investigations will include, but not be limited to, a) determining sources of construction material, and b) evaluating site locations of such facilities as airstrips, roads, drill sites, and construction camps.

Consult with participants in the National Petroleum Reserve, Alaska, program on a) engineering geology and permafrost-related engineering problems, and b) engineering geology-related environmental effects of exploration activities in the Reserve.

5.0011, STUDIES OF THE DYNAMICS OF THE GEOMAGNETIC TAIL AND OF THE GEOMAGNETIC DISTURBANCE FIELD CURRENT SYSTEMS

G.L. Siscoe, University of California, Los Angeles Campus, School of Letters & Science, Dept. of Atmospheric Sciences, *405 Hilgard Ave., Los Angeles, California* 90024 (ATM79-15251)

Two recent, important classes of observations, one showing the presence of large amplitude deformation waves on the boundary of the geomagnetic tail, the other revealing the existence of quasi-permanent patterns of electrical currents linking the magnetosphere and ionosphere, motivated the investigations supported by this grant. The first observation demonstrates the strong mutually interactive nature of the solar wind coupling to the geomagnetic tail, and raises this subject to a level of importance requiring intensive observational and theoretical analysis. This study is directed at documenting the phenomenology of the boundary waves, and their relationship to geomagnetic activity, through the analysis of spacecraft data sets. The analysis is supported by a theoretical effort to investigate the types of boundary waves that can be generated by the various suggested mechanisms relating the dynamics of the tail to magnetospheric storms and substorms.

The second part of the study is an attempt to unify the subject of the geomagnetic signatures of magnetospheric activity, which now is characterized by a diversity of separate signatures each with supposed counterparts in the form of separate physical processes. Unification will be attempted by investigating the variety of signatures that can be produced simply by varying the relative intensities of the structural components of the new, quasi-permanent current system. It is suspected that the putative partial ring current system may be a phantom constructed out of

one of the variety of signatures produced by the quasi-permanent current system. This idea will be explored in more detail.

5.0012, NORTH PACIFIC EXPERIMENT (NORPAX) - STUDIES OF EQUATORIAL DYNAMICS AND LONG PERIOD TRANSPORT VARIATIONS IN THE CENTRAL PACIFIC

R.A. Knox, University of California, San Diego Campus, Scripps Institution of Oceanography, *P.O. Box 1529, La Jolla, California* 92038 (OCE7823134)

This project is part of the North Pacific Experiment (NORPAX). The long-range goal of NORPAX is to understand fluctuations in the upper layers of the Pacific Ocean with time scales of months to years and space in excess of 1,000 kilometers, and the relationship of these oceanographic fluctuations to the overlying and adjoining atmosphere. Achievement of this goal should eventually lead to improved weather/climate prediction for both the Pacific Ocean and North America.

A major component of NORPAX is a coordinated field program to determine the space and time variability of the density and velocity fields in the upper layers of the Equatorial Pacific current system. This field program will occur between February 1979 and May 1980 and will involve the efforts of a number of scientists. Measurements will be made from ships, airplanes, and moored and drifting instruments.

This grant will provide for current meter measurements from three moorings on or near the equator at about 153 degrees W. Five current meters will be placed in the upper 250m of water on each mooring. The moorings will be deployed in September 1979 and retrieved in January 1980.

5.0013, TROPOSPHERIC SAMPLING

Weickmann, U.S. Dept. of Commerce, National Oceanic & Atmospheric Admin., Environmental Research Lab., *Boulder, Colorado* 30302 (8G130536)

PROJECT OBJECTIVE: Conduct a three to six month pilot project involving a high flying non-pressurized aircraft for the collection of ice crystals and aerosols in anvils of cumulonimbus clouds in Dewar bottles and on filters, and the chemical analysis of the scavenged particles which are attached to these crystals by means of an X-ray emission method. For comparison, particles from non-convective cirrus layers will also be collected and will be analyzed in the same way.

CURRENT YEAR PLAN: Conduct the three to six month pilot project.

SUPPORTED BY U.S. Dept. of Commerce, National Oceanic & Atmospheric Admin., Environmental Research Lab.

5.0014, ECHOSONDE COHERENCE AND PHASE STUDIES 15853-GS

E.H. Brown, U.S. Dept. of Commerce, National Oceanic & Atmospheric Admin., Environmental Research Lab., Wave Propagation Lab., *Boulder, Colorado* 80302 (DA0G8975)

To investigate coherent effects in the propagation and scattering of sound in the atmosphere, particularly in relation to mean phase with a view towards remote sensing application for the measurement of atmospheric temperature and wind profiles. Relevance - the development of a simple, inexpensive, and continuous near real-time remote sensor of wind and temperature profiles of the lower atmosphere has a wide range of application: artillery ballistic corrections; transport and diffusion of smoke, dust and chemical agents plumes; high energy and electro-optical sensor atmospheric characterization; fog, ice and precipitation and formation and dissipation; and aircraft operations at airfields.

Theoretical investigation of echosonde mean phase, application of the results to development of an echosonde instrument for remote sensing of wind and temperature profiles, and comparison of acoustic soundings with in-situ wind and temperature measurements at the 300 meter instrumented tower at the Boulder Atmospheric Observatory.

5.0015, DEVELOPMENT OF HIGH-FREQUENCY ELECTROMAGNETIC TECHNIQUES

R.D. Watts, U.S. Dept. of the Interior, Geological Survey, Geologic Division, *Box 25046, Denver Federal Center, Denver, Colorado* 80225 (9780-01756)

STATES TO WHICH PROJECT PERTAINS: Alaska, Utah, Washington, New Mexico.

Digitization and signal processing of airborne pulse sounding data from the Columbia Glacier will be carried out to produce accurate bottom profiles from the deeper parts of the glacier.

Development of high frequency CW and pulse systems for point-to-point measurements in salt and other high resistivity media will be completed and tests carried out in underground workings and between boreholes. Tests and development of radar systems for borehole measurements will be carried out.

SUPPORTED BY U.S. Dept. of the Interior, Geological Survey, Geologic Div.

5.0016, STUDIES IN REMOTE SENSING APPLIED TO GEOCHEMICAL EXPLORATION

F.C. Canney, U.S. Dept. of the Interior, Geological Survey, Geologic Div., Branch of Exploration Research, *Box 25046, Denver Fed. Ctr. Bldg. 25, Denver, Colorado* 80225 (9330-00815)

STATES TO WHICH PROJECT PERTAINS: Maine, Montana and Colorado.

The overall objective of this project is to develop remote-sensing techniques for identifying mineralized areas in regions of heavy vegetation. Vegetation can be used as a link between abnormal chemical conditions in the soil and an aircraft- or spacecraft-mounted sensor for the following reasons: (a) plants generally reflect their geological environment by their distribution patterns and minor-element content; and (b) laboratory and field studies have established that metal stressed and normal vegetation can have subtly different spectral characteristics. Therefore, a geochemical anomaly in a heavily forested area might be detected by spatial and/or spectral changes in the reflection of the vegetation canopy.

To date aerial surveys using color infrared film, multiband photography, and multispectral line scanners, coupled with the simpler interpretative techniques have not been successful in discriminating geochemical anomalies in heavily forested areas. Apparently the reflectance anomaly was totally obscured by variables unrelated to soil geochemistry. However, recent research in cooperation with W. Collins of NASA's Goddard Institute for Space Studies, and using a specially built high resolution airborne spectrometer, suggests that high resolution spectral data, where processed by computerized waveform analysis techniques, can be used to separate vegetation growing over a mineralized zone from background vegetation.

In the current year, additional testing of the instrument and analysis techniques will be done at several mineralized sites of different types.

SUPPORTED BY U.S. Dept. of the Interior, Geological Survey, Geologic Div.

5.0017, SEDIMENT MOVEMENT AND CHANNEL CHANGES IN RIVERS

R.H. Meade, U.S. Dept. of the Interior, Geological Survey, Water Resources Div., *Bldg. 53 Denver Federal Ctr., Mail Stop 415 Box 25046, Lakewood, Colorado* 80225 (CR 75-102)

Sediment moves through river systems in response to specific events and changing conditions in drainage basins. These events and conditions are both natural (floods, climate changes) and artificially-induced (accelerated erosion, reservoirs, diver-

sions, channelizations). The response often takes place over periods measurable in decades or longer. The morphology of the river channels changes as sediment moves through the system.

To assess: (1) changes in river sediment loads over periods of decades or longer, and the factors (natural and artificial) that cause the changes; (2) rates at which rivers change their courses, shapes, and other morphologic features, both in their natural state and in response to artificial influences; (3) effects of infrequent catastrophic events or large-scale human influences on the 'equilibrium' sediment movement and channel morphology in rivers; (4) sources, pathways, and sinks of sediment in rivers.

Basically an historical approach, using available records and making some first-hand field studies. Records will include sediment-load data previously collected by USGS and other agencies; changes in channel morphology will be interpreted by comparing old and new maps plus available aerial photographs of selected rivers in the Upper Missouri Basin. Field studies will include repeated surveys of selected channels and tracer studies of sediment movement.

Daily sediment loads measured on Amazon River ranged from near 10**6 tons per day at Iquitos, Peru, to 3x10**6 tons per day at Obidos, Brazil. Effects of reservoirs on downstream sediment loads in Bighorn River are mixed: one reservoir definitely reduced loads downstream, another shows no discernible effect on sediment loads 200 km downstream after 12 years.

(1) Continue long-term field measurements of channel changes in East Fork River, Wyoming, and Powder River, Montana. (2) Complete analysis of data on sediment loads and hydraulic geometry of Amazon River. (3) Continue analyses of effects of reservoirs on downstream sediment loads and channel geometries.

SUPPORTED BY U.S. Dept. of the Interior, Geological Survey, Water Resources Div.

5.0018 JOINT UNIVERSITY OF COSTA RICA - UNIVERSITY OF DELAWARE MARINE STUDIES PROGRAM

D. Maurer, University of Delaware, School of Marine Studies, *Lewes, Delaware* 19958

OBJECTIVES: (1) To initiate a well planned joint UCR-UD preliminary ecological assessment of commercial and megabenthic invertebrates of Golfo de Nicoya and begin to compile a solid knowledge base about Costa Rica's marine resources. (2) To provide a well equipped, modern, versatile and economical research vessel as a platform from which to do research which can also be used by UCR as a training platform for research vessel crews, oceanographic technicians and marine studies students at graduate and undergraduate levels. (3) To initiate a joint UCR-UD study of current circulation, pollutant dispersion and land use changes, using inexpensive remote sensing techniques. (4) To continue the exchange of personnel between UCR and UD, especially for graduate and technician training. (5) To provide UD as a model, based on its Sea Grant College and University National Oceanographic Laboratory System (UNOLS) status, as one approach to developing marine studies expertise and capability in an academic institution.

ANTICIPATED BENEFITS: (1) Training of 2 UCR research vessel crews and 8-10 oceanographic technicians. (2) Provide information to assess pollutional impacts in the Golfo de Nicoya. (3) Provide training on remote sensing of coastal processes and new information on the current circulation, pollutant dispersion and land use in and around de Golfo de Nicoya. (4) Provide research vessel as platform for UCR to conduct research and train students who are on their way to becoming professional marine scientists.

SUPPORTED BY U.S. Dept. of Commerce, National Oceanic & Atmospheric Admin., Sea Grant Office

5.0019, PREPARATION AND DISTRIBUTION OF THE 1975-1979 U.S. NATIONAL REPORT TO THE INTERNATIONAL UNION OF GEODESY AND GEOPHYSICS

A.F. Spilhaus, American Geophysical Union, *1909 K St. N.W., Washington, District of Columbia* 20006 (EAR78-25075)

The various national committees to the International Union of Geodesy and Geophysics (IUGG) prepare reports on research performed in their countries and present these reports to the IUGG at its general assembly. The reports of the U.S. National Committee have been such valuable summaries of progress and bibliographic resources that the U.S. has continued to prepare them even though they are not required by IUGG. The 1975-1978 Report of the U.S. National Committee is to be published through an arrangement with the American Geophysical Union as four special issues (totalling approximately 1100 printed pages) of its journal Reviews of Geophysics and Space Physics. Thus the Report will receive wide visibility and use and can be properly archived and referenced. The Report comprises over 100 individual review articles with extensive bibliographics, each covering a specific subdisciplinary area of geophysics. As critical reviews of progress of U.S. research during the preceding four years, the Report is more than a monument to U.S. efforts and successes. Its extensive bibliographies are effective sources for specialists in a field to assess the current literature; for students to have a broad exposure to the full range of current geophysical activity in the U.S.; and for the researchers moving into new areas to place their own work in perspective.

SUPPORTED BY U.S. National Science Foundation, Directorate for Astronomical Atmospheric Earth & Ocean Scis., Div. of Earth Sciences

5.0020, DISTRIBUTION OF SUBMERGED AQUATIC VASCULAR PLANTS IN CHESAPEAKE BAY, MARYLAND

R.R. Anderson, American University, School of Arts & Sciences, Dept. of Biology, *Mass. & Nebraska Aves. N.W., Washington, District of Columbia* 20016 (R805977; Q771 -Q131)

The proposed work has two objectives: 1. assess usefulness of archival remote sensing data for determining trends in distribution of submerged plants in Chesapeake Bay; and 2. produce distribution maps of submerged plants in Chesapeake Bay using aerial photography and field work as data sources. With regard to objective (1), the photographic data banks of government agencies and private flying companies will be searched for useful photography. It is anticipated that from 30 to 40 years of data are available over some areas of the Bay. Selected areas, depending on availability of data, will be studied intensively. The final product will be estimates of trends in SAV populations over time spans covered by the photographic data. With regard to the second objective, the aircraft photography and field data will be used to produce distribution maps inked on 1:24,000 U.S.G.S. quad sheets. The mapping project area includes 77 quad sheets which cover the Maryland waters of the Chesapeake Bay and tributaries.

SUPPORTED BY U.S. Environmental Protection Agency, Office of Research & Development, Gulf Breeze Environmental Research Lab.

5.0021, NORSEX EXPERIMENT

J.P. Hollinger, U.S. Dept. of Defense, Navy, Naval Research Lab., *4555 Overlook Ave. S.W., Washington, District of Columbia* 20375 (DN980132)

To investigate the coastal current flowing northbound off the Norwegian coast, creating an oceanic front, and the influence of fresh or brackish water flowing out of the fjords, especially in the spring. A correlative objective is to detemine the accuracy and utility of airborne remote microwave sensors to map currents and mass water movements on an all-weather basis.

To utilize the full complement of sensors, including active and passive microwave, laser, thermal infrared thermometer, environmental and air-lauched AXBTs and dropsondes aboard the NRL RP 3-A aircraft to measure the atmosphere and ocean surface off the Norwegian coast during NORSEX in March, 1979.

SUPPORTED BY U.S. Dept. of Defense, Navy, Office of Naval Research

5.0022, CONTINUOUS OPERATION OF THE FRENCH METEOR RADAR ON PUERTO RICO, 1979-1980

R.G. Roper, Georgia Inst. of Technology, School of Geophysical Sciences, Dept. of Aerospace Engineering & Geophysical Sciences, *Atlanta, Georgia* 30332 (ATM78-10089 A01)

We are growing increasingly aware of a variety of important roles, in upper atmospheric physics, played by tidal motions. While such motions are difficult to measure, two techniques have significantly extended our knowledge for localized studies: incoherent scatter (I.S.) radars and meteor wind radars. The meteor wind radars are far less expensive, and provide valuable data in the 80-100 km range. An array of such meteor wind radars have (in conjunction with I.S. radars) provided valuable guidance in determining which tidal modes of atmospheric oscillation dominate in the middle latitude upper atmosphere. Very little data is available for lower latitudes, and interpretations are conflicting for this part of the globe.

This grant provides for operation of a meteor wind radar at a low latitude location to more globally extend understanding of winds and tidal oscillations in the mesopause region. The data produced will significantly extend our knowledge of mesopheric dynamics. Specifically, the location chosen is near Arecibo. There the continuous meteor wind radar data, in combination with the much more sporadic, but much more detailed and complete I.S. radar data, will allow much more definitive studies than otherwise possible.

SUPPORTED BY U.S. National Science Foundation, Directorate for Astronomical Atmospheric Earth & Ocean Scis., Div. of Atmospheric Sciences

5.0023, EFFECTS OF MINING AND LAND RECLAMATION ON HYDROLOGY OF SOUTHEASTERN KANSAS

A.M. Diaz, U.S. Dept. of the Interior, Geological Survey, Water Resources Div., *Lawrence, Kansas* 66044 (KS 77-081)

Effects of past and present mining of coal, lead, and zinc in southeastern Kansas have caused degradation of streams draining the mined areas. Quantitative measures of the degradation and identification of source areas are needed to assess the effectiveness of pollution-control measures, the possible need for changes in mining and reclamation procedures, and design of a long-term quality-monitoring network in southeastern Kansas.

The objectives of this project are to apply the extensive water-quality data being collected in Project KS 76-076 and remotely sensed data from aircraft and LANDSAT to (1) identification from computer-enhanced imagery of point-source areas where poor-quality water discharges from old shaft mines, strip pits, collapsed areas, spoil embankments, and reclaimed areas, (2) evaluation of land-reclamation effects on water quality by analyzing areal and temporal changes in vegetative vigor in reclaimed areas, (3) establishment of a continuing monitoring program using computer-enhanced imagery to detect anomalies associated with acid drainage, and (4) use of results from above activities to design an improved long-term water-quality-sampling network for the mining area in southeastern Kansas.

Remote-sensing techniques will be used to obtain data for analysis with signal-enhancement systems and digital densitometers to discriminate differences in water quality, degrees of vegetative vigor, and 'hot spots' in mined areas vs. natural areas. The analyses will aid identification of sources of stream-quality degradation related to drainage from shaft mines, stripped areas, collapsed underground workings, and coal-processing activities. Photography and imagery will be obtained repetitively from aircraft and, as appropriate, from LANDSAT for comparison to water-quality data from Project KS 76-076. Additional ground-truth data will be collected in anomolous areas identified from the remotely sensed data. Finally, the data will be used to design a long-term quality-monitoring network in southeastern Kansas.

Multispectral-remote sensing data were obtained by the contractor, Daedalus Enterprises. Concomitant ground-level data were obtained from field measurements and chemical analyses of water samples from 30 sites in Cherry Creek. Preliminary review and analysis was begun for the remote sensing data. (Text Abridged)

SUPPORTED BY U.S. Dept. of the Interior, Geological Survey, Water Resources Div.

5.0024, QUALITY OF WATER AND FLUVIAL SEDIMENT IN STREAMS DRAINING AREAS MINED FOR COAL, LEAD, AND ZINC IN SOUTHEASTERN KANSAS

A.M. Diaz, U.S. Dept. of the Interior, Geological Survey, Water Resources Div., *Lawrence, Kansas* 66044 (KS 76-076)

The Kansas Department of Health and Environment needs (1) benchmark or baseline information on flow and current water-quality characteristics of streams draining areas in southeastern Kansas that have been deep-shaft and strip mined for coal, lead, and zinc; (2) an evaluation of water-quality degradation associated with the mining and with land-reclamation activities; and (3) an evaluation of the effects of implementing state and federal regulations of mining activities on water-quality degradation in areas that will be mined in the future.

The objective of this study is to provide the data and interpretive evaluations needed to define the water-quality characteristics and the water, chemical, and sediment discharge of streams draining areas mined for coal, lead, and zinc in southeastern Kansas.

Water-quality data from an intensive reconnaissance of streams draining areas mined for coal, lead, and zinc in southeastern Kansas will be evaluated for use in designing a comprehensive study of water and sediment quality and determining the water, chemical, and sediment discharge from the mined areas. The comprehensive study will include the establishment of gauging stations on selected streams and the periodic collection and analysis of water and sediment samples to determine the principal chemical and biological constituents, trace elements, and physical characteristics. Analyses of the water-sediment mixture will include the determination of nitrogen and phosphorus species, total organic carbon, chemical oxygen demand, pesticides, and herbicides. Analyses of sediment will include suspended sediment concentration and particle size and particle size of bed material.

Streamflow and water-quality data collection continued as scheduled at 18 sites in the project area. Field activities were coordinated with projects KS 77-081 (remote sensing) for collection of ground-truth data at about 30 sites in the Cherry Creek basin. Rating curves for streamflow and chemical parameters were developed from available data. Results from statistical analysis of the data indicate a high degree of correlation between major chemical parameters and specific conductance or streamflow. Because of this, the sampling program for the project has been realigned to include a reduced frequency of sampling for the third year of the project.

Continue data collection at selected sites. Complete data analysis and interpretation. Prepare final report.

SUPPORTED BY U.S. Dept. of the Interior, Geological Survey, Water Resources Div.

5.0025, THE CV-990 MULTI-SPECTRAL SCANNING RADIOMETER (MSR) MEASUREMENT PROGRAM FOR MONEX

W.L. Smith, U.S. Dept. of Commerce, National Oceanic & Atmospheric Admin., National Environmental Satellite Service, *Suitland, Maryland* 20233 (ATM79-00547)

The objective of this project is to operate and collect observations from a multi-spectral scanning radiometer (MSR) on board a research aircraft (the NASA CV-990) during the summer Monsoon Experiment (MONEX). The MSR measures shortwave (solar) and longwave (earth) radiation. Estimates of radiative fluxes, surface temperature (sea and land), vertically integrated water vapor profiles, cloud heights and temperature profiles are some of the products of these measurements. They will serve as 'ground' truth and 'fillers' for the broader scale satellite-based measurements that cover the entire MONEX region on a regular and frequent time-scale.

These data will be used by MONEX scientists in conjunction with complimentary MONEX data to study the large scale monsoon heat sources and sinks.

MONEX is a major study to increase our knowledge and understanding of the dynamics and thermodynamics of the atmosphere and ocean in monsoon regions. Three research areas have been identified for this experiment. They are the Arabian Sea, the Bay of Bengal, and Indonesia-Malaysia. This research concentrates on the first of these areas. MONEX is important scientifically and also has significance for global agriculture, economics and politics. The initiative for MONEX is from the

government of India with the USSR and USA playing major roles. In addition to the benefits mentioned above, MONEX offers an excellent opportunity for scientific and technical cooperation between, and of mutual benefit to, the U.S., India and the USSR.

5.0026, AN ASSESSMENT OF REFRACTION ERROR AND DEVELOPMEMT OF METHODS TO REMOVE ITS INFLUENCE FROM GEODETIC LEVELING

S.R. Holdahl, U.S. Dept. of Commerce, National Oceanic & Atmospheric Admin., National Ocean Survey, *6001 Executive Blvd., Rockville, Maryland* 20852

STATE TO WHICH PROJECT PERTAINS: Maryland.

The duration of the project is to be one year. The objective is to develop an algorithm for estimating the vertical temperature profile which is needed for Kukkamaki's refraction correction for leveling. The algorithm will construct the profile using solar radiation data historically observed by the National Weather Service. The model will be tested by comparing predicted solar radiation and temperature profiles with observed values obtained at several weather stations in the U.S.

SUPPORTED BY U.S. Dept. of the Interior, Geological Survey, Geologic Div.

5.0027, TERMINAL WEATHER PREDICTION - MEDIUM-RANGE AVIATION FORECASTING

K.F. Hebenstreit, U.S. Dept. of Commerce, National Oceanic & Atmospheric Admin., National Weather Service, Systems Development Office, Techniques Development Laboratory, *8060 13th St., Silver Spring, Maryland* 20910 (8D590502)

OBJECTIVE: To develop and implement operationally techniques to: (1) forecast weather elements required in the terminal forecast for projections in the range from 6- to 72-h, (2) organize this weather information for transmission on the National Distribution Circuit (NDC), and (3) automate the packaging of this weather information in appropriate product formats.

APPROACH: Derive forecast equations using the output parameters of operational numerical models, surface observations, appropriate geoclimatic constants, and other available information such as meteorological satellite data. Investigate and select for operational implementation statistical models which capture the maximum amount of predictive information from the historical data. Tailor organization of the weather forecast information for efficient transmission and optimal applications programming.

PROGRESS: Forecast equations for cloud amount, ceiling, and visibility for both early and final guidance are operational for contiguous states. Development testing of equations for these elements for Alaska is now in progress.

SUPPORTED BY U.S. Dept. of Commerce, National Weather Service, Systems Development Office

5.0028, PROJECT ASH CAN

S.J. Falkowski, U.S. Dept. of Defense, Air Force, Geophysics Lab., *L.G. Hanscom Field, Bedford, Massachusetts* 01731 (6542)

The objective is to document the concentrations of selected aerosols and gases in the stratosphere as a function of latitude, altitude and season in the northern hemisphere. Balloon-borne particulate and gas samplers are flown to altitudes of 70,000, 80,000, and 90,000 feet from Alaska and Panama annually and from New Mexico seasonally except winter. Schedules are coordinated with Project Airstream, the aircraft-borne sampling program, which together with Project Ash Can, constitutes the DOE High Altitude Sampling Program. Filter papers are sent to the DOE Environmental Measurements Laboratory for analysis of particulate radioactivity. Exposed molecular sieve is analyzed at Argonne National Laboratory. Interpretative analysis of data is by EML and the Air Resources Laboratory, NOAA.

SUPPORTED BY U.S. Dept. of Energy, Office of Health & Environmental Research

5.0029, AIRCRAFT DATA COLLECTION AND ANALYSIS FOR CORRELATION WITH THE COASTAL ZONE COLOR SCANNER

F. Polcyn, Environmental Research Inst. of Michigan, *P.O. Box 8618, Ann Arbor, Michigan* 48107 (7-723; 03-8-A01-4299)

OBJECTIVE: Through combined empirical and theoretical approaches analyze calibrated narrow band multispectral scanner data acquired over various natural waters in the Gulf of Mexico to support the validation of Nimbus-G Coastal Zone Color Scanner (CZCS) data for the quantification of total phytoplankton pigments, and total suspended particulate concentrations.

APPROACH: (a) collect calibrated multispectral scanner data in the Gulf of Mexico with the ERIM M-7 narrow band module scanner; (b) provide absolute radiometeric calibration of the scanner system by ground measurements of system response characteristics before and after acquisition of ocean radiance data; (c) reduce the aircraft multispectral scanner data to equivalent zero altitude radiances for comparison with shipboard measurements and with NOAA calculations of atmospherically corrected CZCS data; (d) using the radiance data collected by the M-7, scan spatially simulated data to determine the effects of the averaging process inherent in the resolution of the CZCS and LANDSAT multispectral scanner systems; (e) prepare output products (using CZCS algorithms and algorithms developed in the New York Bight studies) giving the distribution of total suspended particulates and total phytoplankton pigments as determined both by the M-7 scanner and the CZCS; and (f) evaluate second derivative method as applied to raw CZCS data without atmospheric corrections.

CURRENT PLANS: Present plans are to conduct a major multi-unit and interdisciplinary experiment in the Gulf of Mexico during November, 1978. Participating in this effort will be science personnel onboard the RV Athena and the Texas A & M Gyre to acquire atmospheric and oceanic optical measurements. In addition, the Gulf test sites will be overflown by the NASA/AMES U-7 carrying the NASA/Goddard Ocean Color Scanner (OCS), and the ERIM Haviland C-7 aircraft carrying the narrow band M-7 module scanner. Information obtained will provide input to CZCS data validation and algorithm development for generating 'derived' output products.

5.0030, SEASAT PROGRAM - BATHYMETRY AND BOTTOM TOPOGRAPHY MAPPING

R.A. Schuchman, Environmental Research Inst. of Michigan, Radar & Optics Division, *P.O. Box 8618, Ann Arbor, Michigan* 48107 (7-978; MO-AO1-78-00-4339)

OBJECTIVE: The investigation is concerned with the application of the SEASAT Synthetic Aperture Radar (SAR) to measure ocean wavelengths undergoing wave refraction and relating these changes to the presence of islands, shoals, and water depth.

APPROACH: Examine SEASAT SAR data collected over the Gulf of Alaska and select an SAR pass that has noticeable wave refraction present. The radar-equipped Canadian Convair 580 aircraft will also collect data over the Gulf of Alaska test site. A clear water test site in the Carribean will be selected for targets of opportunity. Selected portions of two acquired SEASAT passes will be digitized, and geometry and radiometric distortions in the SEASAT data will be corrected digitally. The data will be reduced into bathymetry maps using an oceanographically acceptable wave refraction model and the results will be compared to all available sea truth. The SAR image output data is to be corrected optically for geometric effects. Image data will be corrected optically to enhance wave trains and obtain spectra at selected locations; these data would then be reduced into a bathymetry map and compared.

SUPPORTED BY U.S. Dept. of Commerce, National Oceanic & Atmospheric Admin., National Environmental Satellite Service

5.0031, RADAR BACKSCATTER AND OPTICAL REMOTE SENSING STUDIES OF THE IONOSPHERE

A.F. Nagy, University of Michigan, Ann Arbor Campus, School of Literature Science & the Arts, Dept. of Atmospheric & Oceanic Sciences, *Ann Arbor, Michigan* 48104 (ATM7821768)

This grant supports studies of the physics and chemistry of the atmosphere and ionosphere in the following areas: Ionosphere-Plasmasphere Modeling - this numerical model solves the coupled continuity, momentum and energy equation of the major ions along a field line, between magnetically conjugate F region altitudes. Such a model, coupled with observational data from the Atmosphere Explorer satellites and incoherent radar backscatter facilities, will significantly enhance our understanding of ionosphere plasmasphere coupling. Radar Backscatter Spectra due to Non-Maxwellian Ion Velocity Distribution - in the presence of sufficiently large perpendicular electric fields, the ion velocity distribution becomes non-maxwellian. This work will calculate how the radar incoherent scatter spectra is affected by such a distribution, and what the corresponding implications are in the analysis and interpretation of results from high latitude incoherent scatter radar observatories. Airglow Studies - analysis of airglow measurements obtained by satellite, rocket and ground-based observation will continue. One study will analyze and interpret data obtained from combined rocket and satellite observations in order to determine the N2 vibrational temperature and the effects of vibrationally excited N2 on the atmosphere and ionosphere. Airglow equipment currently existing at the University of Michigan will be used to study vibrational excitation sources and sinks of N2 ion, reactions of O ion (2D) with N2, and the morphology of N ion emissions.

SUPPORTED BY U.S. National Science Foundation, Directorate for Astronomical Atmospheric Earth & Ocean Scis., Div. of Atmospheric Sciences

5.0032, THE EFFECT OF COUNTRY DRAINAGE DITCHES ON WATER QUALITY AND QUANTITY IN SOUTH CENTRAL MINNESOTA

H.W. Quade, Mankato State University, School of Arts & Sciences, Dept. of Biology, *P.O. Box 34, Mankato, Minnesota* 56001 (A-040-MINN)

The proposed research plan involves field investigations followed by modeling and computer simulation of water quality as affected by an extensive country drainage ditch system related to agricultural land-use practices.

The first year would involve the following investigations which would aid in site selection for the second year as well as simulation and modeling in the third year: 1) qualitative physiographic drainage analysis of the ditches in relation to ditch sheds and effects on lakes and wetlands (pilot studies presently underway); 2) riparian (green belt) survey of the ditches; 3) aquatic macrobenthos indicator survey (pilot studies done on this); and 4) general land use from aerial surveys, EROS, etc.

The second year would involve selected ditch site data gathering including: 1) water chemistry (pilot study nearing completion); 2) water flow; 3) sediments (suspended and surficial in the ditches); 4) macrophyte survey involving temporal nutrient tie-up and release (pilot study nearing completion); and 5) benthic indicators (pilot studies done).

The third year would involve data processing, the developing of models, and computer simulation of water quality and quantity as a result of the ditches. Both deterministic and stochastic models would be developed. Final write-up and cartography would also be accomplished during the third year.

SUPPORTED BY U.S. Dept. of the Interior, Office of Water Research & Technology

5.0033, LANDSAT CAPABILITIES FOR GENERAL WETLANDS MAPPING

B.O. Benn, U.S. Dept. of Defense, Army, Corps of Engineers, Waterways Experiment Station, *P.O. Box 631, Vicksburg, Mississippi* 39180 (31585)

OBJECTIVE: The overall objective of this study will be to demonstrate the applicability of LANDSAT data to the problem of mapping wetland boundaries and determining general information concerning type and character of wetland areas in the U.S.

APPROACH: A literature review will be conducted to examine previous and ongoing applications of satellite multispectral data to wetlands mapping. Appropriate Corps offices will be contacted to establish the Corps wetland data needs from which classes for mapping will be established. Digital image processing techniques will be screened for potential application by reviewing previous work and consideration of the dynamic spectral and spatial characteristics of wetland and upland vegetation constituents. Image processing techniques selected to have the most potential will be evaluated by applying them to selected test areas in both contract and in-house efforts. Wetlands maps prepared from LANDSAT and thematic type imagery will be compared to established ground-truth data to quantitatively rank the performance of the image processing techniques for mapping the desired wetlands class. Related work currently ongoing at the WES and in support of Corps district or division offices will be an integral part of this study. A report will be prepared documenting the study and providing guidance or use of those procedures deemed to have the most applicability to acquiring wetlands for Corps' purposes. This work addresses mission problem nos. 1-1-2 and 4-1-24.

SUPPORTED BY U.S. Dept. of Defense, Corps of Engineers, Waterways Experiment Station

5.0034, LAND USE MAPPING AND DATA COMPILATION

G.L. Loelkes, U.S. Dept. of the Interior, Geological Survey, Land Information & Analysis Office, Geography Program, *1400 Independence Rd., Mail Stop 821, Rolla, Missouri* 65401 (G-1)

The USGS is planning to complete over 400,000 square miles of land use and land cover mapping for FY-79. The USGS Land Use Mapping Program is an ongoing program to complete land use and land cover maps for the entire nation at a scale of 1:250,000 (1:100,00 in selected areas). These maps will help satisfy a long-standing need for a consistent level of detail, standardization of categories and consistent use of scale of a type of data needed by government planners and managers at national, state and regional levels. Aerial photographs and other remotely sensed data serve as the primary source materials used in compiling the land use and land cover maps.

The land use and land cover maps are complemented by three (in the case of cooperative agreements, four) associated maps at the same scale. These associated maps are: political units, hydrologic units, and census county subdivisions. In the case of cooperative agreements, the fourth associated map is federal land ownership.

SUPPORTED BY U.S. Dept. of the Interior, Geological Survey, Land Information & Analysis Office

5.0035, DEVELOP LASER FLUOROSENSORS FOR MONITORING SURFACE WATERS (ORGANIC CARBON)

M. Bristow, U.S. Environmental Protection Agency, Office of Research & Development, Environmental Monitoring & Systems Lab., *P.O. Box 15027, Las Vegas, Nevada* 89114 (J884A-057)

OBJECTIVE: Develop an active airborne monitoring system capable of providing quantitative data on the concentration of total organics in surface waters.

APPROACH: The principle employed is an extension of the laboratory technique of spectrofluorometry. Water is irradiated with ultraviolet light of a specific wavelength and intensity. The resultant fluorescence emission is monitored using a monochromator-multichannel detector combination. The fluorescence signal arises from dissolved organic materials. The water Raman emission band is employed as a built-in reference source with which to compare the amplitude of information concerning the concentration of the dissolved organics.

PROGRESS: A firm correlation has been established between dissolved organic carbon (DOC) and normalized fluorescence measurements made on a large number of field samples.

Plans are being made to build an airborne laser fluorosensor based on this principle.

SUPPORTED BY U.S. Environmental Protection Agency, Office of Research & Development, Environmental Monitoring & Systems Lab.

5.0036, APPLICATION AND DEMONSTRATION OF MULTISPECTRAL SCANNER (MSS) DIGITAL SYSTEM FOR ENVIRONMENTAL MONITORING

M.R. Dockter, U.S. Environmental Protection Agency, Office of Research & Development, Environmental Monitoring & Systems Lab., *P.O. Box 15027, Las Vegas, Nevada* 89114 (J884A-043)

OBJECTIVE: Determine feasibility and demonstrate application of aerial multispectral scanning (MSS) for remote sensing of sediment in water, description of land use relationships, and silviculture/agriculture nonpoint sources of pollution. Optimize aerial thermal infrared scanner survey techniques.

APPROACH: Collection of surface and airborne MSS data to study atmospheric attenuation corrections and site-to-site algorithm transferability. Analyze results compared to EPA standard laboratory testing methods.

PROGRESS: Feasibility of airborne MSS system utility for environmental monitoring purposes has been established, and a field applications demonstration of a satellite scanner for an EPA coastal zone study has been completed.

SUPPORTED BY U.S. Environmental Protection Agency, Office of Research & Development, Environmental Monitoring & Systems Lab.

5.0037, USE OF REMOTE SENSING TO DETERMINE THE HORIZONTAL DISTRIBUTION OF CHLOROPHYLL AND SURFACE CURRENTS IN LAS VEGAS BAY, LAKE MEAD, NEVADA

J. Deacon, University of Nevada, Las Vegas Campus, School of Arts & Letters, Dept. of Biology, *4505 S. Maryland Parkway, Las Vegas, Nevada* 89154 (R805045-01; J884A-044)

OBJECTIVE: Provide measurements of chlorophyll concentrations in support of an EPA program to develop a laser fluorosensor method for performing the measurements from an airborne platform.

APPROACH: Measurements are made and samples collected from boat at premarked locations coincident with an overflight by the aircraft-borne remote monitor. Samples are analyzed and compared to results from the remote monitor.

PROGRESS: A number of flights have been conducted over Lake Mead and correlations have been observed between the respective data bases.

SUPPORTED BY U.S. Environmental Protection Agency, Office of Research & Development, Environmental Monitoring & Systems Lab.

5.0038, AIR-SEA-ICE INTERACTION INVESTIGATIONS WITH X-BAND RADAR

J.A. Warburton, University of Nevada, System Office, Desert Research Inst., *Reno, Nevada* 89507 (DPP78-21718)

An x-band weather radar, now in operation at Palmer Station, Antarctica, will continue to be used during 1979 and the austral summer of 1979-80 in an investigation of the mountain barrier effect on air mass motions, the effects of katabatic and foehn winds on near-shore ice movement and low-level convective elements associated with precipitation. The recorded radar images will also supply 'ground truth' for satellite measurements which are used by other antarctic meteorology projects supported by NSF. In addition, a joint study with the British Survey will be conducted on radar reflectance and precipitation rate relationships in snowfall conditions between Palmer Station Faraday Base. The field work will be concluded at the end of the austral summer of 1979-80 and will be followed by an in-depth analysis of the data obtained and publication of the results of the studies.

Logistics support is required for three scientists to visit Palmer during the austral summer of 1979-80.

SUPPORTED BY U.S. National Science Foundation, Directorate for Astronomical Atmospheric Earth & Ocean Scis., Div. of Polar Programs

5.0039, CHARACTERIZATION, MEASUREMENT AND MONITORING OCEANOGRAPHIC AND ENVIRONMENTAL DATA ACQUISITION AND MONITORING SYSTEM DEVELOPMENT

D.G. Dimmler, U.S. Dept. of Energy, Brookhaven National Lab., *Upton, New York* 11973 (000920; EY-76-C-02-0016)

This project is concerned with the development of new methods and techniques in systems for large scale, continuous, automated, real-time remote sensing and monitoring of environmental conditions at many locations dispersed over large geographical areas. Special attention is directed toward: (1) assuring the accuracy of data by development or appropriate data verification techniques and instrumentation for filtering, sampling, integration, and averaging of parameters from sensors; (2) techniques and instrumentation for data communications systems which are suitable for transmission of remotely sensed data from, and commands to, remotely located stations; and (3) application of computer techniques for the purposes of automatic, real-time data acquisition, control of remote equipment and sensors, as well as improved data verification in real-time. Techniques for verification and ordering of collected data in real-time are considered to be of crucial importance to improve the data credibility as compared with that obtained from existing non-real-time techniques as well as to reduce the often excessive operating costs associated with traditional manual and semi-automated systems. Real-time, automated remote sensing, data acquisition and monitoring instrumentation systems which satisfy these basic requirements for high quality correlated synoptic data from remotely located stations are essential for large area regional environmental and biological studies related to airborne emission, health and safety monitoring, and physical atmospheric or oceanographic measurements which provide the basis for predictive modeling studies. Essential requirements for such systems are: (1) conservation of power and communication bandwidth for the remote sensing data acquisition and monitoring stations; (2) operation of command-response telemetry; and (3) communication capability between geographically dispersed remote stations and a central command and data acquisition station.

SUPPORTED BY U.S. Dept. of Energy, Office of Health & Environmental Research

5.0040, REMOTE SENSING EXPERIMENTS FOR STUDIES OF THE CHRONOLOGICAL PLACEMENT AND SETTLEMENT PATTERNS OF THE HOPEWELLIAN PEOPLES (ABBREV)

N. Greber, Cleveland Museum of Natural History, *Wade Oval, Univ. Cir., Cleveland, Ohio* 44106 (BNS79-06279)

This grant provides support for systematic surveys within the Liberty and Seip Earthworks--large tripart Hopewell constructions in Ross County, Ohio. These surveys will be the first systematic, large-scale surveys within any large Hopewell earthwork. They will continue the study of Hopewell cultural dynamics which includes the recently completed excavations of the Edwin Harness Mound within the Liberty Earthworks. The results of these excavations reinforced proposed similarities in site morphology and artifact distributions between Seip and Harness. The presently proposed surveys will provide presently unavailable data on the extent and time depth of prehistoric activities within the earthworks, for testing further hypothesized relationships between the sites. Data will also be sought to aid in determining the relationships of these sites to the major Hopewell center at the Hopewell site itself.

The physical constraints on the survey, including the extent and present use of the land areas, require the use of non-destructive survey techniques. Since the success of remote sensing techniques is largely dependent upon local conditions, geophysical remote sensing systems--magnetic, resistivity, and surface radar--will be compared in pilot surveys over known archaeological

features. Other local geological data and all available archaeological data will be integrated with the results of these surveys, to determine the specific areas and the specific combination of survey techniques that are most effective. Small-scale excavations are planned for the recovery from prime areas of in situ materials suitable for radiocarbon dating. All cultural materials recovered will be processed for faunal, floral, and artifactual information which will aid in determining the type of prehistoric activities within the earthquakes.

SUPPORTED BY U.S. National Science Foundation, Directorate for Biological Behavioral & Social Sciences, Div. of Behavioral & Neural Sciences

5.0041, INVESTIGATIONS OF FERRAR GROUP ROCKS AND MT. EREBUS, SOUTH VICTORIA LAND, ANTARCTICA

P.R. Kyle, Ohio State University, Columbus Campus, Inst. of Polar Studies, *125 S. Oval Dr., Columbus, Ohio* 43210 (DPP77-21590 A01)

The Ohio State University, under continuing Grant DPP77-21590, will map and sample cumulate rocks at the Warren Range and Ferrar Dolerite sills in the Dry Valley area of McMurdo Sound. Samples of Ferrar Group rocks will be examined in detail using electron microprobe analyses of mineral phases and chemical and isotopic analyses of whole rock samples and mineral separates. An objective of this study is to test if assimilation of granite has occurred in Ferrar Dolerite sills and to use these data to evaluate an assimilation model proposed for the Kirkpatrick Basalt and to examine in detail the importance of fractional crystallization. If this model can be demonstrated it may allow a new insight into the composition of the upper mantle along the Transantarctic Mountains during the Jurassic. Mt. Erebus is an active volcano that has had a lava pool in the inner crater for the last several years. The Principal Investigator has been monitoring the eruptive pattern of Mt. Erebus for the past seven years. Research on the crater area of Mt. Erebus will continue to include geologic mapping, geophysics, remote sensing, and laboratory analyses of samples. Results will contribute to an understanding of the geologic and tectonic history of the McMurdo area during post-mid Cenozoic time.

The Ohio State University scientists will do research in Antarctica during the 1979-80 field season.

SUPPORTED BY U.S. National Science Foundation, Directorate for Astronomical Atmospheric Earth & Ocean Scis., Div. of Polar Programs

5.0042, RELATIONSHIP BETWEEN THE OZONE AND THE STRATOSPHERIC-TROPOSPHERIC CIRCULATION SIMULATED BY THE UCLA GENERAL CIRCULATION MODEL

M.E. Schlesinger, Oregon State Higher Education System, Oregon State University, School of Science, Dept. of Atmospheric Sciences, *126 Agricultural Hall, Corvallis, Oregon* 97331 (ATM7720681)

The objective of this research is the investigation of the relationship between ozone and air motions in the stratosphere and troposphere. In particular, the research is directed toward: (1) determining the relative contributions of the horizontal advection of ozone, the horizontal mass convergence, and the photochemical production and destruction of ozone in maintaining the observed longitudinal relatonship between total ozone and the upper tropospheric flow pattern in middle latitudes, and (2) further understanding of the maintenance of the latitudinal distribution of total ozone by the eddy meridional ozone transport in middle latitudes.

To investigate the relationship between ozone and the stratospheric-tropospheric flow requires knowledge of the four-dimensional distributions of both ozone and winds. Since the required data are not available from observations of the real atmosphere, the method of approach employs the January data simulated by the UCLA stratospheric-tropospheric general circulation model. In particular, the method of approach is to construct and analyze longitude-altitude cross-sections of ozone and the dynamical, thermodynamical and photochemical variables, and their time rates of change, at five-hour intervals extending over 60 simulated hours at 50 N latitude, the latitude where the zonal-mean and longitudinal-variation of the simulated total ozone are maximum.

SUPPORTED BY U.S. National Science Foundation, Div. of Atmospheric Sciences

5.0043, METEOROLOGICAL ANALYSIS FOR THE APPLICATION OF RAPS AQSMS

H.A. Panofsky, Pennsylvania State University, University Park Campus, School of Earth & Mineral Science, Dept. of Meteorology, *116 Deike Bldg., University Park, Pennsylvania* 16802 (R805640; G603A-AB-045)

This proposal consists of 3 parts; all are aimed at air quality modeling dealing with urban problems and are to be verified with observations of T-6 St. Louis experiment (RAPS). In Part I, a simple vertical 2-dimensional atmosphere model will be applied and tested using various formulations of heat flux and mixing coefficients in the boundary layer. Part II will concentrate on the development of the proper lower boundary conditions in urban situations, particularly St. Louis and Los Angeles. A new method will be tested for deriving the correct ground parameters necessary to yield the proper surface energy balance using satellite infrared measurements for these two cities. Surface heat fluxes will be computed and compared with independent estimates. In Part III, the observed distribution of NOx and perhaps CO will be used to test an air quality model developed for Los Angeles, making use of observed temperatures, mixing depths and heat fluxes as well as estimates of these quantities by a quasi-2D horizontal hydrodynamic model.

SUPPORTED BY U.S. Environmental Protection Agency, Office of Research & Development, Environmental Sciences Research Lab.

5.0044, D-REGION CHEMISTRY AND DYNAMICS

A.J. Ferraro, Pennsylvania State University, University Park Campus, School of Engineering, Dept. of Electrical Engineering, *101 Hammond Bldg., University Park, Pennsylvania* 16802 (ATM7819964)

This grant funds a research program having as its main emphasis theoretical studies supported by D-region controlled experiments utilizing the incoherent scatter, high power h.f. 'heater,' and air-glow facilities at the Arecibo Observatory and the cross-modulation facility of the Ionospheric Research Laboratory. The cross-modulation facility will be operational from University Park, Pennsylvania, as well as transported to Arecibo, Puerto Rico, during their coordinated programs.

The research program concentrates on two specific problem areas. D-Region Electrodynamics: Recent rocket measurements have established the prescence of strong vertical electric fields (approximately 1.0 volt/meter) in the D-region. Such data imply the need to examine the role of transport of charged particles as well as the chemistry of this region. A unique technique for monitoring the presence of these fields will be employed, relying upon modulating the vertical current system with an h.f. 'heater' and detecting the reradiated electromagnetic field from this so-called 'ionospheric antenna.' High Power Radio Wave Modification of the Lower Ionosphere: Upon the completion of the new high power h.f. facility at Arecibo by summer 1979, with an effective radiated power of 100 MW, a factor of five or more increase in electron density in the lower ionosphere can undergo significant modification as a result of ion chemistry changes induced by h.f. heating. A number of experiments will be done to study chemical models/rates and magneto-ionic theory.

SUPPORTED BY U.S. National Science Foundation, Directorate for Astronomical Atmospheric Earth & Ocean Scis., Div. of Atmospheric Sciences

5.0045, TEST OF THE LANDSAT-DATA COLLECTION SYSTEM IN THE SUSQUEHANNA RIVER BASIN

J.V. Funt, U.S. Dept. of the Interior, Geological Survey, Water Resources Div., *228 Walnut St., Harrisburg, Pennsylvania* 17108 (PA 73-051)

The potential use of earth orbiting satellite data relay systems for flood warning has not been well explored.

The objective of this project is to test the earth resources technology satellite-data collection system on key stream gages in the Susquehanna River Basin for flood warning.

Four data collection platforms will be field installed on stream gauges in the basin. Data relayed from the gauges will be provided to the Susquehanna River Basin Commission and the National Weather Service's River Forecast Center in Harrisburg.

Data collection platforms were installed at nine gauging stations in the Susquehanna River Basin for relaying data through the GOES satellite. Data collection platforms were operated at four gauging stations in the Susquehanna River Basin using the LANDSAT satellite to relay the data.

The operation of the LANDSAT data collection system will continue. The operation of the GOES data collection system will continue.

SUPPORTED BY U.S. Dept. of the Interior, Geological Survey, Water Resources Div.

5.0046, AIR TRANSPORT OF POLLUTANTS

T.V. Crawford, E.I. du Pont de Nemours & Co. Inc., *P.O. Box A, Aiken, South Carolina* 29801 (672; AT(07-2)-1)

The major objective of the program is to develop (or adapt), test, apply, and validate mathematical models to calculate the transport, diffusion, resuspension, and deposition of atmospheric pollutants released from one or more point sources. Atmospheric transport processes are the primary means by which radionuclides and other pollutants are transported beyond the SRP site boundary. Because SRP is sharing the environment of the southeastern United States with other nuclear facilities, processes that influence the transport of pollutants at distances of 10 to 1000 km are of primary interest. Atmospheric dispersion models will be developed for the SRP site with the cooperation of appropriate modeling efforts at other DOE sites. Meteorological data from an existing instrumented TV tower and seven-tower network will be used to improve knowledge of the transport and diffusion characteristics within the planetary boundary layer. Atmospheric experiments will be planned and executed to test the models for predicting atmospheric dispersion in the SRP environment. Studies will be made of continuous releases from multiple sources and on instantaneous releases from a single point source. The effect of vertical transport, lids, shear, persistence, and low wind speeds on downwind concentrations of pollutants will be studied. Another objective of this program is to combine data generated from the experimental and aircraft programs with data collected under several other programs at the Savannah River Laboratory. The combined data base will be used to validate models which are used to calculate environmental effects of routine releases to the atmosphere and possible accidental releases.

5.0047, CONTINUOUS MONITORS FOR EFFLUENTS

W.W. Pitt, U.S. Dept. of Energy, Oak Ridge National Lab., *P.O. Box X, Oak Ridge Operations Office, Oak Ridge, Tennessee* 37830 (001609; W-7405-ENG-26)

The objective is the development of: (1) automated analytical systems for isolation and identification of specific pollutants; and (2) systems for continuous on-site monitoring of pollutants and health hazards. A three-pronged approach is being taken: (1) detailed characterization studies of specific effluents; (2) adaptation of existing detectors for use as environmental monitors; and (3) identification and conceptualization of new monitors for pollution detection and measurement. A prototype aquatic environmental monitor which continuously measures native fluorescence and the chemical oxygen demand has been assembled and installed for use in monitoring the treated wastewater from coal liquefaction tests. A prototype, portable remote sensing device for detecting fugitive emissions and spills containing polynuclear aromatic hydrocarbons has been assembled and is undergoing evaluation.

5.0048, SOLAR RADIATION INTENSITY STUDIES

N.K. Wagner, University of Texas, Austin Campus, School of Engineering, Dept. of Civil Engineering, *200 W. 21st, Austin, Texas* 78712

DESCRIPTION: Two years of hourly solar radiation data gathered at each of four sites near Houston, Texas have been obtained from Houston Lighting and Power. These data will be correlated with independently obtained standard meteorological data. The objective is to provide a technique for estimating available solar energy from standard meteorological observations (which are abundant) for locations where solar intensity observations are not available. The work will be completed in this second year of the effort.

SUPPORTED BY University of Texas

5.0049, CRYSTALLIZATION OF PYROXENES AND PYROXENE-BEARING ROCKS

J.S. Huebner, U.S. Dept. of the Interior, Geological Survey, *12201 Sunrise Valley Dr., MS 912, Reston, Virginia* 22092 (EAR79-08505)

This is a continuation of work previously funded by NASA but transferred to NSF. Work will continue on the phase relations and physical properties of pyroxenes, and to apply the results to problems in lunar and terrestrial petrogenesis, using a combination of optical and microprobe-chemical analyses, X-ray and electron diffraction, and experimental petrology. The basic goal is to create an essential data base for investigators of planetary magma genesis and metamorphism.

Major activities include experimental efforts to measure the rates of Ca, Mg, and Fe diffusion in pyroxenes; the mathematical modelling of pyroxene and olivine diffusion processes in lunar basalt 77115 and the growth of augite exsolution lamellae in noritic breccia 77215; the description of phase relations in the model basalt system CaO-MgO-SiO2-plagioclase; and the partitioning of chromium between silicate crystals and melts at 10-30 kbar.

5.0050, REMOTE SENSING AND ECOLOGICAL RESEARCH IN WETLANDS

V.P. Carter, U.S. Dept. of the Interior, Geological Survey, Water Resources Div., *12201 Sunrise Valley Dr., Reston, Virginia* 22092 (NR 73-090)

Wetlands are poorly understood, hydrologically controlled environments. They are essential elements in estuarine, marine, lacustrine, and riverine productivity. Information on: (1) wetland hydrologic variables and their relation to wetland vegetation, (2) wetland dynamics and boundary fluctuations, (3) short- and long-term temporal changes and, (4) other ecological aspects as needed to improve our understanding of these ecosystems and to aid in classification and mapping. Wetland plants may serve as sensitive hydrologic indicators giving information on water (oxygen) stress or water quality parameters such as salinity, turbidity, pH, nutrients, or the presence of various pollutants.

To determine the spectral characteristics of wetland vegetation and relate these to interpretation of remotely-sensed data. To develop improved methodology for mapping and classifying coastal and inland wetlands in cooperation with other interested government agencies and non-government groups or individuals. To examine seasonal and long-term changes in wetland ecology as related to changes in environmental parameters including hydrology, water quality, and land use. To assist with interdisciplinary studies requiring biological research and remote sensing such as the Potomac Estuary Study. To aid in the development of models that utilize remote sensing data as part of the prime data base.

Develop cooperative research projects. Cooperators include WRD Districts, TVA, Topography Division (USGS), USFWS, NASA, JPL, interested state agencies and local groups, and others. Work with all types of remotely-sensed data and available types of analysis equipment in order to achieve the best possible results in a variety of wetland studies. Assist in interdisci-

plinary studies by providing biological and remote sensing information that can be related to study objectives.

(1) Cooperative inland wetlands project with the Topography Division completed and final report prepared. (2) Cooperative project with TVA -mapping should be complete by December 1977, wetland classification system for Tennessee Valley Region is in preparation. (3) Dismal Swamp project - 1:100,000 vegetative map completed; 33 observation wells, 8 staff gauges and 35 temporary benchmarks have been installed. Preliminary report has been started. (Text Abridged)

SUPPORTED BY U.S. Dept. of the Interior, Geological Survey, Water Resources Div.

5.0051, HYDROLOGIC INTERPRETATIONS BASED ON HEAT-FLUX ANALYSES AND THE APPLICATION OF REMOTELY SENSED INFORMATION

E.J. Pluhowski, U.S. Dept. of the Interior, Geological Survey, Water Resources Div., *12201 Sunrise Valley Dr., Reston, Virginia* 22092 (NR 70-048)

Aside from thermal loading stemming from powerplant operations, little has been done to assess man's influence on the thermal patterns of natural streams. Near stream environmental changes due to man's activities may adversely impact stream ecology by altering stream temperatures. In addition to stream-temperature problems, evaluation of remote sensing instrumentation as a method of detecting sources of thermal pollution, sedimentation, and erosion in large water bodies as well as current circulation has obvious application to a wide variety of hydrologic problems. (A) To isolate and evaluate the effect of man-imposed changes on stream-temperature patterns; (B) identify stream-temperature patterns under a variety of climatic regimen; (C) to assess near shore current patterns in Lake Ontario using turbidity plumes as tracers; (D) to evaluate the utility of the LANDSAT III thermal imager as a means of detecting thermal plumes in the lake; and (E) to continue work in defining the utility of remotely sensed land-use information as a means of improving streamflow estimates.

Pairs of water-courses consisting of a 'control' stream (one under essentially natural conditions) and one or more streams that have been altered by man's activities have been instrumented in selected basins of the northeast U.S. Comparisons of 'altered' stream and its control should reveal the effects of environmental changes on water-temperature patterns. High-altitude photographs and LANDSAT imagery will be used to detect transitory hydrologic phenomena such as heat and turbidity plumes, shoreline erosion, and ground-water inflow to streams.

Cooling water discharge at the rate of 30 cubic meters per second and flowing as a surface jet orthogonal to the shoreline produced a thermal plume in Lake Ontario that extended 1km off shore and was 2km in width in August 1978. The thermal plume created by the power plant located 19 miles northeast of Rochester, N.Y., changes shape rapidly in response to wind speed and direction. It is anticipated that the 19 degrees C rise in temperature above ambient lake levels created by the heated power plant discharge will be detectable by the HCMM satellite.

To continue field operations at the Ginna power plant for the purpose of detailing both thermal and turbidity plume dynamics under a variety of seasonal conditions. (Text Abridged)

SUPPORTED BY U.S. Dept. of the Interior, Geological Survey, Water Resources Div.

5.0052, NE REGIONAL OXIDANT STUDY - AIRCRAFT MEASUREMENTS OF AIR QUALITY AND METEOROLOGICAL PARAMETERS

J. Gregory, U.S. National Aeronautics & Space Admin., Langley Research Center, *Hampton, Virginia* 23665 (D9-F0758; G603A-AD-040)

OBJECTIVE: The objective of this task is to obtain continuous measurements of O3, NOx, NO, CN, temperature, dewpoint, and air speed during a two-week period from July 31 to August 14, 1979.

APPROACH: The measurements will be made from an instrumented aircraft provided by the Langley Research Center.

SUPPORTED BY U.S. Environmental Protection Agency, Office of Research & Development, Environmental Sciences Research Lab.

5.0053, DETERMINATION OF TERRESTRIAL AGES OF ANTARCTIC METEORITES

J.C. Evans, Battelle Memorial Inst., *P.O. Box 999, Richland, Washington* 99352 (DPP78-24012)

The Battelle Memorial Institute, Pacific Northwest Laboratories, will carry out determinations of the terrestrial ages of antarctic meteorites. Terrestrial ages are the lengths of time since meteorites have entered the earth's atmosphere and have been resting on the surface of the earth. In the cases of the meteorites to be analyzed for terrestrial ages, they fell on the East Antarctic Ice Sheet and have subsequently been riding passively on or in the ice sheet as it flows slowly away from the centers of ice accumulation. Terrestrial ages give minimum ages for the existence of the ice sheet, and glaciologists will be able to use terrestrial ages for other interpretations of ice sheet history. Non-destructive analyses will be made on a large number of the antarctic meteorites now available for research, for such radioactive isotopes as 53Mn, 40K, 238U, and 232Th. These data will also be of use in studying the pre-terrestrial history of the meteorites and the history of the radiation flux of the Sun.

No antarctic field work is planned under this grant.

SUPPORTED BY U.S. National Science Foundation, Directorate for Astronomical Atmospheric Earth & Ocean Scis., Div. of Polar Programs

5.0054, GLACIOLOGY--WATER, ICE, AND ENERGY BALANCE OF SNOW AND GLACIERS, AND SNOW AND ICE PHYSICS

M.F. Meier, U.S. Dept. of the Interior, Geological Survey, Water Resources Div., *Tacoma, Washington* (WR 57-077)

Much of the nation's streamflow and soil moisture recharge are provided by snowmelt, and snow can be measured and managed for hydrologic purposes. Yet snow is highly variable in space and time, and no method yet exists for synoptic monitoring of areal extent. Glaciers are sensitive indicators of climate trends, have significant regulating effects on streamflow, may produce outburst floods and other hazards, and are useful analogs to several important geophysical processes. Yet glacier heat and mass balances cannot be quantitatively related to meteorologic parameters, the flow and storage of water in ice is poorly understood, and the englacial and subglacial environment presents severe measurement difficulties.

Develop methods for synoptic monitoring of snowcover, obtain understanding of how meteorological processes determine snow accumulation and melt, and develop improved techniques for predicting snow mass, distribution, and snowmelt runoff using conventional weather data. Determine how meteorological processes affected glacier mass balances, and how changes in mass balance affect glacier motion, glacier variations, and runoff from glaciers; use this knowledge and glacier variation data to construct climatic histories. Measure and develop an understanding of the physics of water flow through ice and at the ice/rock interface and determine how this affects glacier sliding. Understand why certain glaciers behave in anomalous ways (surges, calving retreats) and use this knowledge to minimize economic hardship in dangerous glacier situations.

Investigate the feasibility of using satellites and other remote sensing techniques for the measurement of mountain snow (extent, thickness, mass, and liquid water content). By operating a high-mountain field data network, attempt to relate snow changes to meteorologic elements. Develop numerical models relating water storage as snow to meteorologic input and runoff/evaporation output. Relate glacier mass balance at a field station to meteorological elements, and long-term changes in balance to runoff and ice flow. Use the resulting understanding to analyze variations of other glaciers in terms of climate. Measure water pressure and flow in, within, and out from various levels in and under a glacier, relate water movement to thermodynamics, hydraulics, and rheology of the local ice envi-

ronment, and relate water pressure and thickness to rate of glacier sliding. (Text Abridged)

SUPPORTED BY U.S. Dept. of the Interior, Geological Survey, Water Resources Div.

5.0055, COLUMBIA GLACIER
M.F. Meier, U.S. Dept. of the Interior, Geological Survey, Water Resources Div., *Tacoma, Washington* (WR 77-158)

Recent work by Austin Post indicates that calving glaciers may become unstable and retreat very rapidly, causing a great increase in the discharge of icebergs. Columbia Glacier is the only calving glacier in Alaska which has not yet made such a rapid retreat in Neoglacial or modern time. Indications exist which suggest that such a retreat may be imminent. The increased discharge of icebergs drifting into Valdez Arm might cause accidents to or interruptions of the movement of tankers carrying oil from Valdez.

Determine the probability that Columbia Glacier will go into a rapid retreat mode in the next few years, and if so, predict the approximate iceberg discharge.

Determine the stability of the present terminus by hydrographic studies, photogrammetry, and glacier flow studies, with special reference to the configuration and effect of the moraine shoal. Extend these studies to other calving glaciers to determine a calving law. Measure iceberg sizes, numbers, and drift trajectories and wind stress. Determine annual mass balance and discharge of the Columbia Glacier system. Use these data in numerical models to determine probable future behavior of terminus and iceberg flux. Conduct a sensitivity analysis of these results.

Hydrographic and sub-bottom surveys were conducted, and wind and wave data obtained, in and near Columbia Bay. The geodetic survey net was extended. Ice-velocity data were derived from air photography. Balance, motion, and thickness change were measured at 62 locations along the length of the glacier. Radioecho sounder design for airborne use has begun. Numerical models were investigated and some preliminary runs made. The glacier continues to thin near the terminus, and a very large embayment formed in 1977. The stability of the terminus appears to be precarious.

Complete project, except for final numerical anaylsis and report writing.

SUPPORTED BY U.S. Dept. of the Interior, Geological Survey, Water Resources Div.

5.0056, NAVY ENVIRONMENT - ANALYSIS OF SEASAT-A SAR IMAGERY
D.A. Rothrock, University of Washington, Div. of Marine Resources, Polar Science Center, *Seattle, Washington* 98105 (DN975357; N00014-79-C-0418)

The objective of this effort is to analyze synthetic aperture radar (SAR) imagery of arctic sea ice obtained from SEASAT-A to obtain measurements of sea ice displacement versus distance along an axis 500 to 800 km long. These data will contribute to understanding how the distribution of ice thickness is changed by deformation.

Successive days of SAR imagery of sea ice from the same area will be compared and movements of reference features will be measured, thus providing the average daily velocity as a function of distance along lines 10 to 500 km in length. LANDSAT imagery will be used for ground truthing purposes, and will also be compared with SAR imagery to attempt to make a distinction between open water and thin ice.

SUPPORTED BY U.S. Dept. of Defense, Navy, Office of Naval Research

5.0057, NORTH PACIFIC EXPERIMENT (NORPAX) - TRANSEQUATORIAL AIR XBT SECTIONS DURING THE SHUTTLE EXPERIMENT
E.D. Stroup, University of Washington, Graduate School, *Seattle, Washington* 98105 (OCE7823792)

This project is part of the North Pacific Experiment (NORPAX). The long-range goal of NORPAX is to understand fluctuations in the upper layers of the Pacific Ocean with time scales of months to years and space scales in excess of 1,000 kilometers, and the relatonship of these oceanographic fluctuations to the overlying and adjoining atmosphere. Achievement of this goal should eventually lead to improved weather/climate prediction for both the Pacific Ocean and North America.

One major component of NORPAX is a coordinated field to monitor the space and time variability of the density and velocity fields in the upper layers of the Equatorial Pacific Current system. This field program will occur between January 1979 and June 1980 and will involve a number of scientists. Measurements will be made from ships, airplanes and moored instruments. This grant will provide Dr. Stroup with the funds to organize and direct the 16 aircraft flights that will sample the equatorial temperature field by AXBTs. Dr. Stroup will insure the quality of the data, make analyses of the temperature fields and investigate relationships between the temperature fields and other oceanographic variables.

SUPPORTED BY U.S. National Science Foundation, Directorate for Astronomical Atmospheric Earth & Ocean Scis., Div. of Ocean Sciences

5.0058, SEASAT PROGRAM - THE USE OF SEASAT IMAGERY TO STUDY THE BERING SEA ICE
S. Martin, University of Washington, School of Arts & Sciences, Dept. of Oceanography, *Seattle, Washington* 98105 (7-976; MO-A01-78-4335)

OBJECTIVE: Use existing sea-ice program (OCSEAP) to provide ground truth for evaluation of SEASAT capability (SAR, SMMR, VIR, ALT) for characterization of ice cover in the Bering Sea. Use SEASAT data for study of ice dynamics and wave absorption by sea ice.

APPROACH: Three different observational scales will be employed: SEASAT images; aircraft overflights and surface truth; and laboratory modeling.

The high resolution SAR images will be used to study the response of ice during periods of cyclonic and anticyclonic circulation. The SMMR and the VIR will provide complimentary large-scale images of the ice in order to determine the distribution of ice types, the large-scale response and the ice behavior preceding and following the SAR turn-ons. Altimeter data will also be looked at to see if it yields meaningful information about either long waves propagating into the pack, or pressure ridge statistics.

Surface truth data of the ice edge will be obtained during a research cruise of the NOAA ship SURVEYOR along the ice edge in Bristol Bay during 1978. Also a helicopter will traverse the sea ice in Norton Sound, and plan several low-level photographic overflights about regions of large-scale grease ice formation. Two periods of surface truth observations are also planned during the fall of 1978 and the winter of 1979.

Plans are to continue present laboratory work on the properties of ice grown in a wave field. This will yield physical insight into the large scale processes observed by satellite.

5.0059, RURAL OXIDANT STUDIES AND THE ROLE OF NOX IN RURAL OXIDANT FORMATION
H.H. Westberg, Washington State University, School of Engineering, Dept. of Chemical Engineering, *Pullman, Washington* 99163 (R806683-01; G603A-AD-037)

OBJECTIVE: Aircraft and ground level measurements of ozone and its precursors will be made in the northeast United States with the intent of regional scale model validation. Because of the magnitude of the study, other government funded research groups will also participate in the meteorological and pollutant data collection program. Estimates of natural hydrocarbon emissions in this area of the United States will be made.

APPROACH: WSU will use an aircraft equipped with O3, NOx, and SO2 instrumentation to measure pollutant levels over large geographic areas of the northeastern United States. Grab samples for detailed hydrocarbons will be collected at strategic points along the flight path. These grab samples will be analyzed by sophisticated gas chromatographic techniques at a ground base site. The ground base site will also be fully

equipped to make several pollutant and meteorological measurements.

PROGRESS: WSU has performed several similar studies in past years. EPA reports of these activities are available. This study will not involve the use of any new measurement procedures but will collect more useful data for mathematic model validation.

6.0001, ANALYTICAL MODELLING OF LOAD-DEFLECTION BEHAVIOR OF INTERVERTEBRAL DISC SUBJECTED TO AXIAL COMPRESSION

M.L. Burns, Tuskegee Inst., Graduate School, *Tuskegee Institute, Alabama* 36088 (DF051970; AFOSR-78-3578)

AF function - the Air Force operational envronment involves exposure to a wide variety of mechanical forces including flail and impact. The body in general and the musculoskeletal system particularly is adversely affected by these forces. This is of special importance in cases of ejection from high performance aircraft where the probability of disabling injury is unacceptably high. The lumbar region is subjected to most of the body load. One of the more common injuries is lumbar disc compression failure. A qualitative model for the mechanical behavior of the disc is needed. The overall objective of this research is to improve the knowledge of the physiology and mechanical properties of the human intervertebral disc. This work should provide essential information to understand the short duration, transient loading problems of the spinal disc and will also be applicable to the fields of diagnostic, preventive and reparative medicine. Deficiency - a mathematical model is needed for predicting the mechanical properties of individual discs and their associated vertebrae. Objective - seek an understanding of the mechanical properties and behavior of the spinal column. This interest ranges from problems associated with the man-machine environment subjected to external dynamic forces to those encountered in the selection of suitable materials for intervertebral disc replacement. Of particular interest is the biomechanical modelling of intervertebral joint response to axial compressions, where an intervertebral is understood to be an intervertebral disc and adjoining vertebrae. Contribution - directly supports research being conducted under sub-area 1.8

The initial task of this research will be to develop a computer program which can interpolate and adequately smooth the available creep response data of Kazarian. A mathematical analysis of experimental data will then be attempted, wherein, it may prove necessary to develop the analytical solutions of the 'Dominant Three-Kelvin-Unit Model'. It should then be possible to determine and tabulate Young's moduli and viscosity coefficients for the obtained analytical/mechanical models.

6.0002, MEDICAL RESEARCH OF OPERATIONAL PROBLEMS IN ARMY AVIATION

F.S. Pettyjohn, U.S. Dept. of Defense, Army, Medical Research & Development Command, Aviation Medicine Research Div., *Fort Rucker, Ozark, Alabama* 36360 (DA0B6894)

To provide the US Army information and recommendations for protection of aviator health from medical hazards encountered in operational Army aviation.

To apply accepted medical research methods in Army aviation to fulfill the above objective.

SUPPORTED BY U.S. Dept. of Defense, Medical Research & Development Command, Aeromedical Research Lab.

6.0003, DEVELOPMENT OF MEASUREMENT TECHNIQUES FOR THE MEDICAL ASSESSMENT OF VISUALLY COUPLED SYSTEM (VCS) COMPONENTS

R.W. Wiley, U.S. Dept. of Defense, Army, Medical Research & Development Command, Bio-Optics Div., *Fort Rucker, Ozark, Alabama* 36362 (DA0E6734)

To develop measurement techniques for the medical assessment of Visually Coupled System (VCS) components.

It is possible to inadvertently compromise an aviator's safety and physiological performance when designing and fabricating a VCS. Therefore, the VCS hardware must be scrutinized carefully to insure mutual man-machine conformity. The first phase of the study will be concerned primarily with the helmet mounted sight (HMS) component of the VCS. The approach during this phase will be to conduct laboratory and flight tests to determine the aiming/tracking capabilities of a crew member using head orientation. The effects of eye dominance, helmet suspension, helmet weighting and target speed on accuracy will also be investigated. The second phase will be focused on the assessment of helmet mounted displays (HMD). Factors such as display color, image quality and size, brightness, contrast and their impact on the visual system of the crew member and consequent performance will be investigated.

SUPPORTED BY U.S. Dept. of Defense, Medical Research & Development Command, Aeromedical Research Lab.

6.0004, INSTRUCTIONAL METHODS AND MEDIA

J. Reed, U.S. Dept. of Defense, Air Force, Human Resources Lab., *Williams Air Force Base, Chandler, Arizona* 85224 (DF223820)

To determine the contribution of a variety of instructional methods and media on tactical flying training.

Phase I - Using a randomized control-experimental group, training on the air refueling director lights trainer will be evaluated. Phase II Using a one-group pre-test experimental design, correlation techniques will be applied to determine the relationship of turkey shoot results, normal syllabus grades and time to first kill on a standard target in the SAAC. Phase III - Using a one-group pre-test/post-test experimental design for an aerial gunnery task, correlation techniques will be applied to determine the relationship to overall air combat outcomes based upon pilot experience, turkey shoot results, peer ratings, and instructor pilot evaluation. Progress in the TAC ACES II Program will also be measured. Phase IV - An experimental and control group design will be employed utilizing the tactical voice communiations trainer. Criterion performance will be evaluated to determine the training value of the device.

SUPPORTED BY U.S. Dept. of Defense, Air Force, Human Resources Lab.

6.0005, KINETICS OF ENERGY METABOLITES IN HUMANS, DIABETES AND DRUG ACTION

G.L. Searle, U.S. Veterans Admin., Dept. of Medicine & Surgery, Medical Center, *4150 Clement St., San Francisco, California* 94121 (556-14-3966; 662-001-P)

The kinetics of energy metabolites (primarily glucose, its products and its precursors) are being evaluated in human and animal models.

Studies of the action of phenethylbiguanide (DBI) and dichloracetate (DCA) in conscious overnight fasted dogs indicate

that these two drugs in combination have significant hypoglycemic potential. In normal control animals the drugs increased glucose utilization by 150% and reduced glucose synthesis from lactate by one half. Glycemic level was, however, little affected. In the alloxan diabetic dog excessive glucose turnover was reduced by 34%, glucose synthesis from lactate was reduced by 56% and the blood glycemic level was reduced 17%.

In collaborative studies with NASA Ames Research a rat model proposed to reflect the altered metabolism of the muscular dystrophic state has been evaluated with respect to alanine turnover and glucose synthesis. Animals treated with CCl4 turned over -.56 mg alanine per minute vs. a value of 0.33 mg per minute for controls. The percentage of glucose synthesized from alanine was increased by a factor of approximately 2 in the CCl4 treated animal. CONCLUSIONS: These results suggest that it will be quite possible to quantitate, through the assessement of alanine turnover and gluconeogenesis therefrom, the degree of muscle protein wasting that is known to occur in space flight.

SUPPORTED BY U.S. Veterans Admin., Dept. of Medicine & Surgery

6.0006, AUTOMATED AIDS TO ISD

F. Brecke, Veda Inc., *7851 Mission Ctr. Ct., San Diego, California* 92108 (DN994006; N61339-78-C-0142)

To determine the feasibility of reducing the resources and time required to develop ISD-based training through consolidation of common elements and links across Navy aircrew tasks to form a data base for each step in the ISD analysis process.

Instructional psychologists will examine ISD data produced in previous efforts and demonstrate the feasibility of a general data base.

SUPPORTED BY U.S. Dept. of Defense, Naval Training Equipment Center, Human Factors Lab.

6.0007, LOW-COST APPROACH AND LANDING TRAINER REQUIREMENTS

K.W. Lindenberg, Appli Mation Inc., *1000 Woodcock Rd., Orlando, Florida* 32803 (DN894028; N61339-78-C-0134)

Low-cost, part-task trainers could radically improve training effectiveness. This effort will refine and perform an initial evaluation of a system developed for field evaluation.

An approach and landing refresher trainer will have known problems corrected and then enter iterative development at a field site to arrive at a system for initial evaluation. Trainer has been developed in the laboratory using low-cost, off-the-shelf components.

SUPPORTED BY U.S. Dept. of Defense, Naval Training Equipment Center, Human Factors Lab.

6.0008, AUTOMATED ADAPTIVE TRAINING FOR THE LANDING SIGNAL OFFICER

R. Breaux, U.S. Dept. of Defense, Navy, Naval Training Equipment Center, Human Factors Lab., *Orlando, Florida* 32813 (DN794013)

To develop, implement and test, in the context of an automated trainer, techniques for training which will improve the training progress of the landing signal officer (LSO) and thereby reduce cost in manpower and equipment, through development of models of the LSO task and pilot-LSO interaction. Use of modeling techniques can increase training effectiveness by providing objective performance measurement and guidance in skill acquisition at any point in the training process.

The effort consists of: (1) identification of visual and auditory cues; (2) development of models of the visual scene, pilot response, and pilot-LSO interaction; (3) application of voice recognition, performance measurement, and automated adaptive training technologies; and (4) empirical test of effectiveness of the training system.

SUPPORTED BY U.S. Dept. of Defense, Naval Training Equipment Center, Human Factors Lab.

6.0009, DETERMINATION AND IDENTIFICATION OF HUMAN BRAIN WAVE PATTERNS ASSOCIATED WITH COGNITIVE AND PERFORMANCE EVENTS (ABBREV)

E. Donchin, University of Illinois, Urbana Champaign Campus, School of Liberal Arts & Sciences, Dept. of Psychology, *Urbana, Illinois* 61801 (DN675068; N00014-76-C-0002)

The overall objective is to attempt to determine and identify human brain wave patterns associated with (1) particular stimuli; (2) cognitive events in a learning situation; and (3) performance events in a simulated aircraft cockpit. Such information could provide a basis for improving human performance in decision making and man-machine communication.

Experiments will continue on: (1) further elucidation of the event related potential (ERP) vocabulary, e.g., stability of P300/expectancy relationships and ERP differences between target and non-target stimuli; (2) biocybernetic tests in the cockpit environment, e.g., effects of turbulence-imposed work load on processing during simulated landing; and (3) development of a closed loop biocybernetic channel, i.e., one in which some parameter of the ERP is used by the controlling computer to modify system operating parameters, e.g., measures of work load and task sharing.

SUPPORTED BY U.S. Dept. of Defense, Navy, Office of Naval Research

6.0010, ANTHROPOMETRIC STUDY OF NAVAL AIRCREW PERSONNEL

H.G. Gregoire, U.S. Dept. of Defense, Navy, Naval Air Test Center, *Patuxent River, Maryland* 20670 (DN977636)

To develop a new, more useable anthropometric data base for use in the development and evaluation of aircrew stations, life support and survival equipment, emergency egress envelopes, and job classification of aircrew personnel.

A new anthropometric survey of aircrew personnel will be conducted. The effort will be accomplished in four phases. Phase I will be the identification/development of an appropriate measuring methodology. During Phase II the anthropometric parameters to be included will be identified and an optimal sampling strategy selected. The data collection will be accomplished in Phase III. The final phase will be the development of a report format which will optimize the usability of the data.

7.0001, ARTIFICIAL INTELLIGENCE AND HUMAN ERROR PREVENTION - A COMPUTER-AIDED DECISION MAKING APPROACH

R.W. Brady, University of Illinois, Urbana Champaign Campus, Graduate School, *Urbana, Illinois* 61801 (OS-80020; OS161407 (TRAIS NO.))

The objective of this research is to demonstrate the feasibility of integrating an intelligent computer system into the cockpit of a civilian aircraft. The computer will be viewed as an adaptive crew member who could assist the pilot and during critical periods when demands upon the pilot may exceed his capability to respond quickly and coherently, and reduce his workload to decrease the likelihood of an aircraft accident. Specific goals for the system are that it performs non-critical tasks. The system shall inherently be able to plan and order tasks according to degree of criticality and shall be able to perform these tasks if requested by the pilot to do so.

SUPPORTED BY U.S. Dept. of Transportation, Office of the Secretary of Transportation

7.0002, CATEGORICAL MACHINE THEORY, WITH APPLICATIONS TO SYNTAX-DIRECTED TRANSLATION AND CONTROL THEORY

M.A. Arbib, University of Massachusetts, Amherst Campus, School of Arts & Sciences, Dept. of Computer & Information Science, *Amherst, Massachusetts* 01002 (MCS76-84477)

This research is defined by two types of questions: the first type addresses specific problems within the theories of computation and control; the second explores the applicability of various algebraic techniques. Questions within control theory include a unified theory of machine interconnection, the duality of estimation and control, the proper generalization of the internal model principle, and the extension of the theory of linear continuous-time systems to handle time-varying systems and delay-differential equations. Topics within computation theory include iterative theories, more applicable models of nondeterminism, graph automata, and the algebraic semantics of SIMULA-like languages. Algebraic techniques whose applications will be explored are algebraic theories and topoi (a topos is a general structure which can specialize to boolean or intuitionistic logic on the one hand, and to a category of sheaves as used in algebraic geometry on the other). These tools and those forged in earlier research on categorical machine theory will hopefully make it possible to solve problems in computation and control which would be impossible, or at least highly intractable, without them.

This is a continuation of grant MCS-7203733AO2.

SUPPORTED BY U.S. National Science Foundation, Directorate for Mathematical & Physical Sciences, Div. of Mathematical & Computer Sciences

7.0003, INTERPRETATION OF SATELLITE IMAGERY BY COMPUTER-QUANTITATIVE METHODS

P.R. Baumann, State University of New York, Albany Campus, Graduate School, *1400 Washington Ave., Albany, New York* 12203 (SER78-00001)

The objective of this proposed project is to develop a computer software system and related instructional materials that will provide undergraduate students the opportunity to learn how to interpret satellite imagery by using computer and quantitative techniques. Fourteen times a day both of NASA's LANDSAT satellites orbit the earth collecting land use and resource information from the earth's surface. Together, these satellites are able to scan any area of the globe, except the poles, every nine days. As living space in the United States and the world continues to shrink rapidly, land use and resource planning become more and more vital. Americans are being faced now and will continue to be faced for many years to come with the problem of how to use best their finite space and resources. To make informed decisions, up-to-date land use and resource information become vital. To employ this new technology for the purpose of acquiring information needed to make meaningful decisions about the use of our land and resources, it is necessary to make people aware of its capabilities and potential and to train people to use it, which represents the overall goal of this proposed project.

A course is to be developed which will provide students with experience in interpreting satellite imagery in the digital form by using computer and quantitative techniques. This approach has both economic and accuracy advantages over the almost universal photographic interpretation.

7.0004, IMAGE PROCESSING BY MEANS OF HIERARCHICAL RELAXATION SHAPE ANALYSIS

L.S. Davis, University of Texas, Austin Campus, School of Natural Sciences, Dept. of Computer Sciences, *200 W. 21st St., Austin, Texas* 78712 (ENG79-04037)

Shape analysis is crucial to the solution of many problems in image pattern recognition. One of the most successful approaches to automatic shape analysis has been the syntactic approach. In this research program, a new syntactic analysis technique called hierarchical relaxation, based on representing shapes by stratified shape grammars from which contextual constraints on the organization of shapes can be automatically computed, is explored. Hierarchical relaxation was designed specifically to account for the ambiguity associated with extracting primitives from shapes, a problem not explicity dealt with in most syntactic pattern analysis schemes. Hierarchical relaxation is being investigated in the context of a real image pattern analysis problem - recognizing airplanes based on their silhouettes.

7.0005, OPTIMAL SURFACE DESCRIPTIONS FROM LIMITED DATA

H. Fuchs, University of Texas, Dallas Campus, Graduate School, *Richardson, Texas* 75080 (MCS77-03905)

In many technical endeavors the surface of a three-dimensional solid must be reconstructed from limited data, either to enable comprehension of its overall structural characteristics, or to allow its automatic manipulation and analysis.

Past research has generated encouraging preliminary results for the class of situations in which the data are specified as a sequence of single contours, and a new algorithm which generates, from any sequence of contours, an optimum surface, according to a minimum-surface-area measure.

This research is attempting to generalize this approach to the large class of structures which contain a variable number of closed contours on each level. Methods of compressing the resulting surface description with minimum degradation to the structural definition are being explored. Such surface descriptions are increasingly used in computer-aided design, bio-medical research, numerical control, visual flight simulation, and topography.

8.0001, PURCHASE AND INSTALLATION OF A HIGH CURRENT, HIGH STABILITY ACCELERATOR

C.A. Barnes, California Inst. of Technology, Graduate School, Dept. of Physics Mathematics & Astronomy, *1201 E. California Blvd., Pasadena, California* 91109 (PHY77-10134)

This grant will provide funds for the purchase and installation of a high current Van de Graaff accelerator. The voltage will be very stable, to plus or minus 1 KeV at full voltage current. The second year of this grant will provide funds for auxiliary equipment to implement a highly original research program in a wide variety of subjects in nuclear science with a strong emphasis on nuclear astrophysics.

This is the first year of a two-year continuing grant.

SUPPORTED BY U.S. National Science Foundation, Directorate for Mathematical & Physical Sciences, Div. of Physics

8.0002, THE ENERGY DEPENDENCE OF PARTIAL PHOTOIONIZATION CROSS-SECTIONS IN THE SOFT X-RAY REGION

I.E. Lindau, Stanford University, Stanford Electronics Lab., Dept. of Electrical Engineering, *Stanford, California* 94305 (DMR79-13102)

The energy dependence of partial photoionization cross-sections in the far ultraviolet and soft x-ray regions, 20 to 2000 eV (600 to 6 A) will be determined in order to utilize the unique properties of synchrotron radiation as an excitation source. The adequacy of the Hartree-Fock description of the photoionization process will be tested for the 1s electrons of a few systems with great importance in chemisorption studies. The strengths of plasma as functions of excitation energy will be studied with particular emphasis on testing the validity of the sudden approximation close to threshold and the relative contributions to

the plasma strength of intrinsic and extrinsic losses. Resonance photoemission effects will be examined systematically for transition metals and rare earths, where excitation occurs into discrete states in a partially filled shell. The strong multielectron effects observed in the 4d, 5s, and 5p subshells of, for instance, cesium and barium will be compared in detail to the theoretical predictions of the random phase approximation with exchange (RPAE). The physical mechanism behind shake-up and shake-down processes will be studied for compounds with open d-shell configuration and later be extended to chemisorption of small molecules on 3d, 4d, and 5d transition metals.

8.0004, RESEARCH IN ATOMIC AND MOLECULAR PHYSICS AT THE JOINT INSTITUTE FOR LABORATORY ASTROPHYSICS

A. Phelps, University of Colorado, Boulder Campus, Joint Inst. for Lab. Astrophysics, *1200 University Ave., Boulder, Colorado* 80302 (PHY79-04928)

Support of experimental and theoretical research in atomic and molecular physics will be continued at the Joint Institute for Laboratory Astrophysics. The JILA research program is grouped into four broad areas: 1) The interaction of electromagnetic radiation with atomic and molecular systems, particularly the interaction of intense laser radiation with atoms and molecules either in an isolated environment or when subject to perturbing collisions. 2) The study of negative ion physics and of photodetachment processes. 3) Collision processes involving state selected neutral or ionic atomic and molecular species. 4) Fundamental and precision measurements, particularly using the latest advances in atomic metrology.

In addition, one or two conferences and/or workshops will be held each year, to focus on topics of intense current interest and bring together specialists to discuss progress and prospects for various sub-fields.

This work is a continuation of that previously supported by Foundation grant PHY76-04761A02.

This is the first year of a three-year continuing grant.

8.0006, QUATERNARY SEMICONDUCTOR MATERIALS

E.M. Swiggard, U.S. Dept. of Defense, Navy, Naval Research Lab., *4555 Overlook Ave. S.W., Washington, District of Columbia* 20375 (DN980021)

To prepare single crystal epitaxial films of the III-V compounds, to develop epitaxial growth technology, to lattice match layers to substrates and to develop those III-V epitaxial materials for Navy solid-state electronic and electrooptic devices.

Single crystals in epitaxial form such as Ga, In, As, and P have applications in electrooptic and electronic devices. These compounds will be prepared by various applicable expitaxial techniques including liquid phase and vapor phase. New methods of film growth are to be sought to improve material properties and processing technology. Structural match to InP substrates will be made so that the epitaxial films will be strain-free with low defect interfaces. Novel growth and purity control steps will be investigated to control impurity levels and substrate EPI interface. New material combinations will be investigated for both electrooptic materials and wide band gap semiconductors.

8.0007, RESONANCE SPECTRA OF SYNTHETIC METALLOPORPHYRINS

D.C. O'Shea, Georgia Inst. of Technology, School of Physics, Dept. of Physics, *225 North Ave. N.W., Atlanta, Georgia* 30332 (DMR79-07758)

Resonance Raman spectroscopy promises to be a powerful technique for elucidating the vibrational and electronic structures of both the ground and excited states of synthetic metalloporphyrins. Previous work from Professor O'Shea's laboratory has shown that the variation in Roman spectrum with exciting laser wavelength ('excitation profile'), in weak coupling cases, can be explained in terms of coupling constants for the molecule. The goals of the present work are (1) to extend the range of Raman excitation wavelengths into the near ultraviolet in order to probe extremely strong resonance states of the metalloporphyrins and, (2) to develop the techniques of computerized resonance Raman difference spectroscopy in order to discern changes in the Raman spectra due to changes in the substituents on, or chemical environment of, the macrocycles.

Because of the close structural resemblance of the model porphyrins to chlorophyll, heme proteins, and other biological chromophores, these techniques, once developed, are expected to enable one to examine these important biological molecules and the effects of the environment on their activity. It has been shown, for instance, that small changes in cytochrome c structure can be discerned by resonance Raman difference techniques.

First year of a three-year continuing grant; renewal of work supported by DMR77-05971.

8.0008, CLASSICAL AND QUANTUM THEORY OF TURBULENT BEHAVIOR IN NONLINEAR SYSTEMS

J.B. Ford, Georgia Inst. of Technology, School of Sciences & Liberal Studies, Dept. of Physics, *Atlanta, Georgia* 30332 (DMR78-27584)

Research previously supported by DMR7611966. Theoretical research on turbulent behavior in nonlinear systems will be carried out. In particular a new theoretical description for turbulent trajectories in classical nonlinear Hamiltonian systems will be developed. The phenomenon of energy transport as heat in many-body, model nonlinear systems will be examined with

the possibility of demonstrating that it is a consequence of their underlying turbulent orbits, and to develop an analytic theory predicting the thermal conductivity of these models. Also, a quantum theoretical description of turbulent behavior will be developed for those systems in which turbulent behavior is known to occur classically. The common goal of these investigations will be to extend our knowledge regarding the stochastic properties of completely deterministic nonlinear systems which are of interest to many areas of condensed matter. This is the first year of a three-year continuing grant.

8.0009, RESEARCH PROGRAM IN MATERIALS SCIENCES
M.H. Cohen, University of Chicago, School of Physical Sciences, Dept. of Physics, *5734 S. Ellis Ave., c/o Hinds Geophysics Lab., Chicago, Illinois* 60637 (DMR78-24698)

Major collaborative programs are continued on disordered materials and on phase transitions. The former emphasizes disordered graphite intercalates, amorphous semiconductors, and glassy metals. The latter, representing a modification of the previous emphasis, stresses the role of metastability in transitions, especially in disordered and in two-dimensional materials.

Two newly initiated programs represent the addition of new capabilities to the prior program. These are: surface reactions, involving theoretical and experimental studies of reactions on solid surfaces; and the development of materials science applications of high resolution electron microscopy.

Partial support is also provided for the operation of central experimental facilities. This award is a continuation of DMR77-24223.

8.0011, WAVE-WAVE INTERACTIONS
M. Raether, University of Illinois, Urbana Champaign Campus, School of Engineering, Dept. of Coordinated Science Laboratory/Physics, *207 Engineering Hall, Urbana, Illinois* 61801

Studies of wave-wave interactions in an electron beam-plasma system led to the discovery of a spontaneous decay instability of a beam-plasma wave into an ion acoustic wave and an electron plasma wave. Good agreement was found with a theoretical model based on three-wave coupling.

SUPPORTED BY University of Illinois

8.0012, SPECTROSCOPIC INVESTIGATION OF PLASMA TURBULENCE
M. Raether, University of Illinois, Urbana Champaign Campus, School of Engineering, Dept. of Physics, *207 Engineering Hall, Urbana, Illinois* 61801

In continuation of the consulting agreement between the University of Illinois and the University of Azarabadegan that was started in 1977, a cooperative research program in plasma physics was initiated during Dr. Raether's six-week stay at Tabriz in summer 1978. The principal investigators at Tabriz are Prof. Shirinpour and Prof. Moslehi-Fard. The program will be devoted to a spectroscopic investigation of plasma turbulence with the main objective to measure ion temperatures during ion acoustic turbulence.

SUPPORTED BY University of Illinois

8.0013, FABRICATION AND PROPERTIES OF ONE-DIMENSIONAL SYSTEMS
N.J. Giordano, Purdue University, School of Science, Dept. of Physics, *Executive Bldg., West Lafayette, Indiana* 47907 (DMR79-06716)

An experimental program to study the properties of several different types of one-dimensional systems will be carried out. This work falls into two main categories. (1) The electrical properties of random one-dimensional systems will be studied to provide a detailed, quantitative test of recent theoretical predictions that Anderson localization should be observable in these systems. (2) A new type of superconducting point contact, the first in which the geometry of the contact region is under direct experimental control and its nature well characterized, will be investigated. This will allow a more detailed study of the physics of these devices than has been possible with point contacts of conventional design. Moreover, these point contacts should have good mechanical and thermal stability making them prime candidates for a number of practical applications.

In order to make the samples required for these experiments, several new techniques for fabricating ultra small structures will be developed. These techniques will not be limited to applications described above, but should also prove useful in many other microfabrication problems.

This is the first year of a three-year continuing grant.

SUPPORTED BY U.S. National Science Foundation, Directorate for Mathematical & Physical Sciences, Div. of Materials Research

8.0014, COLLECTIVE STRUCTURE OF MASS-100 NUCLEI
P.C. Simms, Purdue University, School of Science, Dept. of Physics, *Executive Bldg., West Lafayette, Indiana* 47907 (PHY79-19187)

The interactions between nuclei are so complicated that it is necessary to treat most particles in a nucleus as an assembly with simple properties. Many aspects of nuclear structure can be described in terms of the collective properties of the assembly with a few nuclei treated as moving in the average potential created by the assembly. Nuclei with relatively large deformations have been found in the rare-earth and actinide regions, and a rotational description has been very successful for the properties of these nuclei. There has been no satisfactory description for the 'transitional' nuclei between closed shells and regions of strong deformation. This research program combines precise systematic measurements and detailed theoretical calculations to show that many transitional nuclei can be described as slightly deformed rotors. Excited nuclear states are produced by heavy-ion-(xn) reaction and studied with in-beam gamma ray spectroscopy; excitation functions, angular distributions, coincidence, directional correlation, linear polarization, and Doppler shift measurements are made on gamma rays. Energy levels and decay properties are determined and interpreted with a Coriolis-coupling calculation similar to that used for strongly deformend nuclei. This is the first increment of a three-year continuing grant, currently supported under NSF grant PHY-12610A01.

8.0016, SOLID-STATE STUDIES OF AMORPHOUS MAGNETIC SOLIDS

C. Chien, Johns Hopkins University, School of Arts & Sciences, Dept. of Physics, *34th & Charles Sts., Baltimore, Maryland* 21218 (DMR89-10536)

Mossbauer spectroscopy, magnetization, susceptibility, resistivity and X-ray diffraction measurements will be utilized to study the hyperfine interactions, structural properties, magnetic properties, transport properties, critical phenomena, percolation, spin glass behavior and collective excitations (spin waves) in amorphous magnetic solids. Some studies will be made in close collaboration with groups using other techniques, such as neutron diffraction. Solids which can be made in both crystalline and amorphous forms, amorphous solids with abundant antiferromagnetic exchange interactions, non-eutectic binary amorphous systems and nominally pure amorphous metals will be studied in order to gain further insight in these largely unexplored areas. The results of these studies provide needed information for the understanding of the intrinsic properties of amorphous magnetic solids, many of which also show potential for practical applications.

This research was previously supported by DMR 7709598.

This is the first year of a three-year continuing grant.

SUPPORTED BY U.S. National Science Foundation, Directorate for Mathematical & Physical Sciences, Div. of Materials Research

8.0017, ATOMIC AND MOLECULAR PHYSICS

D. Kleppner, Massachusetts Inst. of Technology, School of Science, Dept. of Physics, *77 Massachusetts Ave., Cambridge, Massachusetts* 02139 (PHY79-09743)

Research will continue in several broad areas: atoms in strong electronic and magnetic fields, weakly bound molecules, atomic line broadening, and cold hydrogen atoms. Studies of atoms in high fields will be extended to the region where the magnetic interaction is stronger than the Coulomb interaction, and investigation of the weakly bound molecule NaAr. To develop techniques for high resolution studies of free-bound transitions, and to initiate studies of Rydberg molecules; a systematic study of line broadening in which the intensity and polarization of reradiation due to both elastic and inelastic collisions will be investigated, together with two newly predicted types of light-induced collisional energy transfer; applications of newly developed cold atomic hydrogen sources to precision measurements in excited atomic hydrogen.

This is the first year of a 4-year continuing grant.

This research is a continuation of that previously funded under NSF grant PHY77-09155A01.

8.0018, PHYSICS OF INTERSTELLAR MOLECULES

A. Dalgarno, Smithsonian Institution, Astrophysical Observatory, *60 Garden St., Cambridge, Massachusetts* 02138 (144410-31A)

Computations necessary for the calculation of the rate coefficient for proton exchange reactions.

SUPPORTED BY Smithsonian Institution, Astrophysical Observatory

8.0019, DEFECTS IN SEMICONDUCTORS

C. Penchina, University of Massachusetts, Amherst Campus, School of Arts & Sciences, Dept. of Physics & Astronomy, *Amherst, Massachusetts* 01002 (DN675518; N00014-76-C-0890)

Development of electronic and optical components for naval communications and surveillance systems will require increased understanding of the properties of semiconductors. Understanding of the role of impurities and defects is imperative to the preparation of such materials and to prediction of their behavior in devices and in a radiation environment.

The investigator is using a variety of techniques to investigate the electronic nature of the deep level states in gallium arsenide produced by oxygen and chromium impurities. These techniques include photoionization cross-sections, photo-Hall effect, photocapacitance, and cathodoluminescence measurements. The effects of stress on these measurements are used to deduce defect symmetry properties, and temperature effects are used to deduce relationship of defect state to the band structure of the solid. Photoluminescence spectra having phonon sideband induced structure will be used to determine the magnitude of Franck-Condon shifts. Theoretical studies of the temperature dependence of the energy levels and on photoionization cross-sections will continue. Also calculations will be made on electroabsorption processes and their relation to site symmetries.

SUPPORTED BY U.S. Dept. of Defense, Navy, Office of Naval Research

8.0020, ELECTRON TRANSPORT AND MAGNETIC INTERACTIONS IN METALS

J. Bass, Michigan State University, School of Arts & Letters, Dept. of Physics, *Soil Science Bldg., East Lansing, Michigan* 48824 (DMR77-04680 A02)

Experimental studies of low-temperature transport properties previously supported by DMR7514138 will be continued. Magnetothermoelectric measurements on simple metals at low and ultra-low temperatures will be done in order to achieve a better understanding of many-body effects in thermoelectricity (i.e., electron-phonon mass enhancement and the Nielsen-Taylor effects) and of the source of the Giant Magnetothermopower Oscillations which were discovered in aluminum and indium in recent research done in this project. Also, the sources and properties of the recently discovered low- and ultra-low-temperature thermoelectric anomalies in tungsten will be investigated. Finally the studies of dilute magnetic alloys using the technique of combining traditional transport and magnetic measurements with direct and independent determinations of the microscopic spatial distribution of impurities will be continued.

8.0021, INTERACTION OF ELECTRONS AND IONS WITH PLASMA

M. Seidl, Stevens Inst. of Technology, Graduate School, Dept. of Physics & Engineering Physics, *Castle Point Station, Hoboken, New Jersey* 07030 (PHY79-08555)

A study of the production and heating of volume plasmas by electron beams will be continued. The broad objective of the research is to explore the basic processes responsible for electron beam heating of plasmas confined in magnetic mirrors. The importance of the various interaction modes for transverse electron heating will be assessed. For this purpose the nonlinear evolution of the slow and fast cyclotron modes will be studied. The role of plasma and magnetic field inhomogeneities for transverse heating will be explored. Production of thin layers of dense plasmas on the surface of nonmetallic solids will be initiated. Three basic production methods will be explored: ohmic heating, electron bombardment, and ion bombardment. Ion emission from these surface plasmas will be studied. Particular attention will be paid to thermionic emission of alkali ions from zeolites and to secondary emission of negative hydrogen ions from surface plasmas produced by bombarding alkali hydrides with alkali ions.

This research is a continuation of that previously supported under NSF grant PHY-7707214A02.

SUPPORTED BY U.S. National Science Foundation, Directorate for Mathematical & Physical Sciences, Div. of Physics

8.0022, HYDROGEN PUMPED IODINE LASER
J.A. Blauer, Bell Aerospace Co., *P.O. Box 1, Buffalo, New York* 14240 (DF187160; F29601-76-C-0063)

The objective of this work is to develop a high energy, chemically pumped, electronic transition laser. Detailed studies of the H and HI reaction will be used to investigate energy transfer from vibrationally excited hydrogen molecules to iodine atoms and to demonstrate lasing by electronically excited iodine atoms at 1.315 microns.

Atomic hydrogen will be generated by shock heating mixtures of H(2) and Ar to 4500 degrees K. The hydrogen atoms will be expanded out of the shock tube through a nozzle where HI will be injected into the flow. Optimum cavity conditions will be sought to demonstrate lasing. Other techniques to generate sufficient flows of hydrogen atoms will be pursued. Other energy transfer systems will be evaluated as to their potential for high energy, chemically pumped, electronic transition lasers.

SUPPORTED BY U.S. Dept. of Defense, Air Force, Weapons Lab.

8.0023, LIMITED DIMENSIONALITY AND SURFACE EFFECTS IN METALLIC SYSTEMS
R.A. Buhrman, Cornell University, Ithaca Campus, Graduate School, Dept. of Applied Physics, *101 Sage Graduate Ctr., Ithaca, New York* 14850 (DMR77-09879 A02)

Experimental research on the electronic and magnetic properties of metals in limiting and unusual physical environments previously supported by DMR-7402609 will be continued. Static and dynamic transport techniques and resonance techniques will be used to investigate the quantum phenomena arising from size effects in microminiature metallic particles. The intent of this research is to advance the understanding of the transition regime between metallic and atomic-like behavior in such systems. The magnetic susceptibility of metals at or near free surfaces will be investigated by the use of high-resolution susceptibility measurements. A new surface-sensitive magnetic probe that is proposed for development will also be used. An exploratory investigation of the electrical and magnetic properties of ultra-finely dispersed cermet materials will be initiated.

SUPPORTED BY U.S. National Science Foundation, Directorate for Mathematical & Physical Sciences, Div. of Materials Research

8.0024, CRITICAL BEHAVIOR OF ROTATION-INVARIANT FERROMAGNETS
O.A. McBryan, Cornell University, Ithaca Campus, School of Arts & Sciences, Dept. of Mathematics, *Ithaca, New York* 14850 (DMR77-04105)

Research in theoretical statistical mechanics will be carried out. In particular, the critical behavior of two-dimensional ferromagnets which have rotationally-invariant spin interactions will be investigated. The critical properties of these systems are believed to be similar to those of gauge-invariant quantum field theories in four dimensions which are currently used to describe the strong interactions of elementary particles. The relationship between these two branches of theoretical physics will be investigated. Also, it will be determined rigorously whether or not SO(n)-symmetric two-dimensional ferromagnets exhibit phase transitions at low temperatures.

8.0025, JOINT US-USSR COLLABORATION IN SEMICONDUCTOR PHYSICS (ABBREV)
J.W. Corbett, State University of New York, Albany Campus, School of Arts & Sciences, Dept. of Physics, *1400 Washington Ave., Albany, New York* 12222 (INT76-10315)

This grant is to support the establishment of a two-year collaboration between the Institute for the Study of Defects in Solids and the Institute for Semiconductor Physics in Novosibirsk, USSR. This collaboration will take the form of exchanges of senior scientists, joint projects and coordinated research programs in the area of semiconductors. US scientists are to be exposed to the current Soviet state of research in this field at one of the most advanced research centers in the USSR.

SUPPORTED BY U.S. National Science Foundation, Div. of International Programs

8.0026, DEFECTS IN SEMICONDUCTORS
J.W. Corbett, State University of New York, Albany Campus, School of Arts & Sciences, Dept. of Physics, *1400 Washington Ave., Albany, New York* 12222 (DN123026; N00014-75-C-0919)

Studies of defects in semiconductors, defects produced by radiation or by ion implantation of foreign species, are of great importance to a broad spectrum of Navy electronics systems. Radiation effects studies support nuclear radiation vulnerability programs and ion implantation studies support new material and electron device technology.

The investigator combines a variety of theoretical and experimental techniques for identifying defects in semiconductors and understanding their effect on material properties. EPR, ENDOR, transient capacitance, Rutherford backscattering, channeling, and optical measurement techniques are used. Current efforts include studies of hydrogen-related defects in silicon, and studies of lithium, boron, and gold-related defects. Another problem area is the relationship of oxygen impurities and heat treatment on the defect nature of silicon. Recently, interest has risen on the problem of impurities related to dislocations and these will be studied. The renormalization group technique will be applied to the theory of defects. Studies will be made on nature of defects in laser annealed semiconductors.

SUPPORTED BY U.S. Dept. of Defense, Navy, Office of Naval Research

8.0027, OPTICAL STUDIES OF SUPERCONDUCTING TUNGSTEN BRONZES
E.M. Brody, University of Rochester, School of Engineering & Applied Science, Dept. of Aerospace & Mech Science, *260 Crittenden Blvd., Rochester, New York* 14627 (DMR78-12993)

Raman and Brillouin inelastic light scattering and photoelastic modulation ellipsometry will be used to study the electron and phonon properties affecting superconductivity in the hexagonal tungsten bronze system AxWO3 (A equals K, Rb, Cs, Tl) as a function of composition and temperature. The Brillouin studies will probe for acoustic phonon softening and permit the determination of the single crystal elastic moduli. Ellipsometry will be used to determine the optical constants necessary to interpret the Brillouin spectra. This work is important for determining the properties of materials which govern their macroscopic superconducting behavior.

SUPPORTED BY U.S. National Science Foundation, Div. of Materials Research

8.0028, ENERGY DEPENDENCE OF X-RAY POLARIZATION ROTATION
G.G. Cohen, Vassar College, Graduate School, Dept. of Physics & Astronomy, *Raymond Ave., Poughkeepsie, New York* 12601 (DMR7810308)

Recent laboratory experiments have shown that the plane of polarization of a linearly polarized X-ray beam can be rotated by simple transmission through a (110) Si crystal. Both the amount of rotation and the amount of absorption of X-ray depended on the orientation of the crystal in the incident beam, an X-ray analog to optical birefringence.

Two new experiments will be performed: (1) study the effect at higher energy (Mo K alpha at 0.709A), varying such crystal parameters as the thickness; and (2) test the earlier results with a (110) Ge crystal by performing a polarization rotation experiment in the critical region near an absorption edge.

8.0030, ELECTRICAL TRANSPORT IN FERROMAGNETIC METALS AND ALLOYS

L. Berger, Carnegie Mellon University, Mellon Inst. of Science, Dept. of Physics, *4400 5th Ave., Pittsburgh, Pennsylvania* 15213 (DMR78-24679)

Two experiments will be done to observe two newly predicted effects involving the interaction of ferromagnetic domains with electrical currents in pure cobalt. In the first experiment, a direct current crossing the domain walls is expected to cause the coercive field (Hc) of the ferromagnet to decrease and even to vanish. In the second experiment, the dragging of domain walls by a current is expected to be facilitated by the application of a variable magnetic field.

In addition, the magnetoresistance of concentrated Pd-Fe, Pd-Co, Pd-Ni-Fe, Pt-Fe, and Pt-Co alloys will be measured at temperatures down to 4 degrees K. These materials are among the most likely to have a large and technically useful magnetoresistance. Also, the Hall effect of these alloys will be measured. The effect of alloy ordering on magnetoresistance will be studied. This is the first year of a three-year continuing grant.

8.0031, THEORETICAL INVESTIGATIONS IN HIGH-ENERGY AND ELEMENTARY PARTICLE PHYSICS

R.D. Carlitz, University of Pittsburgh, School of Arts & Sciences, Dept. of Physics, *4200 5th Ave., Pittsburgh, Pennsylvania* 15260 (PHY77-08287 A01)

Research will be done in theoretical physics to further our understanding of the elementary particles.

The investigations will be aimed at uncovering the basic laws that govern the interactions of the fundamental constituents of matter. At the present stage of our knowledge we have only a guess as to what these fundamental constituents are. We know that ordinary matter is composed of chemical elements and chemical elements are reducible to atoms and atoms are made up of atomic nuclei and electrons. The nuclei are themselves collections of protons and neutrons held together by the strong nuclear force. The electrons appear to be elementary (not composites of some other particles), but the protons and neutrons show themselves to be complex structures in a variety of experiments. This has led to the hypothesis that they are composed of more fundamental constituents. These hypothetical constituents of the proton and neutron are called quarks. They are hypothetical because, despite occasional claims to the contrary, no one has yet succeeded in convincing the community of physicists that he has detected a quark in an experimental apparatus.

The mathematical formulation of the laws of nature which govern the interactions and combinations of these quarks is very complicated, and we do not at this time know what final form it will take. Most of the work to be done in this project is involved with one or another aspect of this problem.

8.0032, LIGHT SCATTERING IN FLUIDS

W.I. Goldburg, University of Pittsburgh, School of Arts & Sciences, Dept. of Physics, *4200 5th Ave., Pittsburgh, Pennsylvania* 15260 (DMR77-09910 A02)

Under study are the dynamics of phase separation in fluids, the intensity and spectral width of light scattered from a tricritical mixture, and the low-frequency flicker noise (1/f noise) in a binary mixture near its critical point. The variation of critical temperature with sample size in binary mixtures of varying composition will be measured. Finally, a collaborative exploratory venture into biochemistry is planned - a study of pH oscillations in enzyme-catalyzed reactions in an immobilized enzyme system.

This is a continuation of research supported by Grant No. DMR 73-05247.

8.0033, EXPERIMENTS ON GASES AT LOW TEMPERATURE

G.M. Seidel, Brown University, Graduate School, Dept. of Physics, *University Hall, Box 1883, Providence, Rhode Island* 02912 (DMR79-10006)

Research supported under NSF Grant No. DMR77-95593 will be continued with new emphasis being placed on the experimental problems associated with the production of a dense gas of spin-polarized atomic hydrogen. Such a gas has been predicted to a unique quantum mechanical system possessing unusual thermodynamical properties. A microwave discharge in a gas of molecular hydrogen will be used to dissociate the molecular hydrogen into atomic hydrogen. A helium-3, helium-4 dilution refrigerator will be used to cool the gas to temperatures as low as 0.1 degrees K after it has been spin-polarized by a high intensity magnetic field. The presence and density of the spin-polarized gas will be determined by superconducting microwave cavity techniques. The objective of this research is to study the stability of atomic hydrogen and, if stable, to study its many-body properties. Particular attention will be given to the question of the predicted Bose-Einstein condensation and possible superfluid state.

8.0034, DISSOCIATION OF FAST MOLECULAR HYDROGEN IONS ON NOBEL GASES

B.M. Doughty, East Texas State University, School of Science & Technology, Dept. of Physics, *E. Texas Station, Commerce, Texas* 75428 (T-561)

Cross-section measurements for 3s and 4s state hydrogen atom production by 10-150 keV H2 ions incident on Kr have been attempted with an experimental arrangement used previously for proton measurements. The experiment involves passing the beam through a 'thin' gas target cell and measuring Balmer radiations from the resulting fast hydrogen atoms in an evacuated flight tube. Production of ns state hydrogen atoms from H2 ions is more complicated than from proton projectiles both theoretically and experimentally. A new system has been constructed to alleviate several deficiencies in the proton apparatus. The new system has greater pumping speed, thus providing sharper gas boundaries and reduced background, or residual, emissions from the observation chamber. In addition, the beam can be observed in the collision region as well as in the evacuated observation chamber. This capability with the ability to monitor beam collisions with the wall of the collision chamber exit aperture provides a strong tool for investigating or eliminating aperture effects. Beam-aperture interactions have not been adequately studied in previous H2 ion measurements. Cross-sections

for production of 3p and 3d state hydrogen atoms will also be measured.

SUPPORTED BY Robert A. Welch Foundation

8.0035, DETERMINATION OF PROTON-INDUCED IONIZATION CROSS-SECTIONS OF SELECTED METALS
A.R. Zander, East Texas State University, School of Science & Technology, Dept. of Physics, *E. Texas Station, Commerce, Texas* 75428 (T-589)

Investigations of proton-induced ionization processes in thick metallic targets have been extended to proton energies below 100 keV. Values of absolute K-shell ionization cross-sections for incident protons for Z equals 20-30 metals have been obtained as a function of proton energy down to 60 keV. Comparison of the results to modified theoretical models for such collision processes appears to indicate that additional modifications may be required. The additional modifications may be dependent upon stopping power effects. This possibility is currently under investigation.

Additional studies of energetic heavy ions incident on various targets are under way in order to determine the relative contributions of one- and two-step vacancy production processes in such collisions. The results obtained to date are inconclusive due to relatively large radiative electron capture contributions.

8.0036, POSITRONIUM REACTIONS IN THERMOTROPIC LIQUID CRYSTALS AND OTHER MOLECULAR SUBSTANCES
J.D. McNutt, University of Texas, Arlington Campus, School of Science, Dept. of Physics, *Arlington, Texas* 76019 (Y-400)

The formation and reactions of positronium and the formation and properties of positronium compounds have been studied by measuring lifetime spectra for positrons annihilating in gases, and by measuring total cross-sections for the scattering of low-energy positrons from gas atoms. A complex temperature dependence, the first heretofore found for any gas, and a strong density dependence have been observed for the positronium yield in H2 gas at 293, 250, and 77 degrees K. O-Ps induced cavity formation occurs in 77K H2. The addition of concentrations of Ne to H2 at 77K strongly affects the formation probabilities for e plus H2 and for e plus (H2)n cluster states, the positronium yield, and the behavior of o-Ps in cavities. Preliminary results with C2H6 gas at 295K indicate the formation of e plus C2H6 at low gas densities, of e plus (C2H6)n cluster states at higher densities, positronium yields as high as 0.80, and the pronounced interaction of o-Ps with microscopic density inhomogeneities. Successful quantitative models have been developed for several of these effects; others remain unexplained. A monoenergetic, timed position beam has been utilized to accurately measure total scattering cross-sections for 2-75 eV positrons in Ne and Xe. The first measurement of positron-gas partial cross-sections has just been accomplished.

8.0037, MEASUREMENT OF THE COSMIC-RAY SIDEREAL ANISOTROPY ABOVE 1 TEV
H.E. Bergeson, Utah Higher Education System, University of Utah, School of Science, Dept. of Physics, *1400 E. 2nd S., Salt Lake City, Utah* 84112 (AST77-07627 A01)

An underground muon detector designed to measure the cosmic-ray sidereal anisotropy at galactic containment energies has been built in a mine near Heber, Utah. Three layers of plastic scintillators, totalling 37.3 sq. meters each, are located at a mean depth of 4.86 times 10 to the minus 4th power g cm to the minus second power. The median primary cosmic-ray rigidity is 1400 GV for detected events, and the counting rate exceeds 10 to the 8th power yr to the minus 1st power. A computer operates the experiment, performs periodic stability and calibration checks, and is also programmed to search for transient events and narrow-angle temporary anisotropies. The apparatus is complete and essentially operational. Continuous operation is expected in 1977. The sidereal anisotropy of cosmic rays will be measured for the next three years and the results reported.

This action provides additional funding and extends the duration of the grant number AST77 07627.

8.0038, MATERIAL SUPPORT TECHNOLOGY - THIN FILMS, SURFACES, AND INTERFACES - A FOURIER-TRANSFORM THEORY OF THEIR ELECTRONIC STRUCTURE
H.J. Monkhorst, Utah Higher Education System, University of Utah, School of Science, Dept. of Physics, *1400 E. 2nd S., Salt Lake City, Utah* 84112 (DN775345; N00014-77-C-0319)

The Navy has need for improved performance solid-state electronic devices. One limitation has been a less than adequate understanding of the surface and interface physics of these devices. This program will assess new techniques for obtaining an understanding of these semiconductor surfaces and interfaces.

A new theoretrial approach is being developed for electronic structure calculations on thin films, surfaces and interfaces. The Fourier-transform technique developed for bulk solid calculations is being adapted into a two-dimensional version for application to surfaces. In the first stage, energies and electronic states are calculated at the Hartree-Fock level. At a later stage, electron correlation effects will be included. The properties for simple prototype solids will be calculated first and eventually applied to semiconductors. Various surface reconstruction effects in these materials will be considered.

8.0039, THEORETICAL STUDIES OF THE MAGNETIC PROPERTIES OF SOLIDS
D.L. Huber, University of Wisconsin, Madison Campus, School of Natural Sciences, Dept. of Physics, *Agriculture Hall, Madison, Wisconsin* 53706 (DMR79-04154)

Research previously supported by DMR7701057.

Theoretical research on the magnetic properties of solids will be carried out. The main emphasis will be on solids containing rare earth and transition metal ions. The specific projects to be pursued will include: 1) the calculation of the properties of rare earth magnets which focus on the dynamical behavior near a second order phase transition, 2) an investigation of the dynamics of quasi-one- and two-dimensional planar magnets, with a particular emphasis on effects which can be probed using ultrasonic, nuclear and paramagnetic resonant techniques, 3) the study of the properties of disordered magnets showing spin glass behavior, and 4) the investigation of energy transport among magnetic ions in paramagnetic crystals.

This is the first year of a three-year continuing grant.

10.0001, MAGNITUDE AND VARIABILITY OF SOLAR SPECTRAL IRRADIANCE
G.E. Shaw, University of Alaska, Fairbanks Campus, School of Arts & Sciences, *Fairbanks, Alaska* 99701 (ATM78-12185)

Measurements of the absolute magnitude and variability of solar irradiance from ground stations are being recorded to determine if the sun's visible spectral irradiance is varying with time. The accuracy of the determination is expected to be 1% absolute, the precision (relative change) will be a few tenths of 1%. Because of improved calibration procedures these accuracies and precisions are about 5 times better than existing determinations. Solar variability, if it is observed, will be related to Zurich sunspot number, faculae indicies, solar flares and solar magnetic activity. In conjunction with measuring solar variability, aerosol spectral optical data will be collected at Mauna Loa.

These data will be related to sources and long range transport of aerosols accross the Pacific Ocean. Atmospheric ozone will also be studied by absorption of light in the Huggins and Chappuis bands.

10.0002, IONOSPHERIC ACCELERATION MECHANISMS

R.D. Sharp, Lockheed Missiles & Space Co. Inc., Space Sciences Laboratory, *3251 Hanover St., Palo Alto, California* 94304 (ATM79-11174)

This grant will support the analysis of data from a plasma experiment on the S3-3 satellite. The satellite is in a polar elliptical orbit with apogee at 8000 km and is exploring a region of space which has not previously been studied. A number of new discoveries have already been made with the experiment relating to the processes responsible for the acceleration of auroral particles. The central focus of the proposed investigation will be the understanding of these mechanisms and the related processes that energize ionospheric ions and inject them into the magnetosphere. In particular, the data will be analyzed for evidence of electric fields in the polar ionosphere.

10.0004, OBJECTIVE-PRISM RADIAL VELOCITIES OF STARS

A.R. Upgren, Wesleyan University, School of Science in Society, Dept. of Astronomy, *Middleton, Connecticut* 06457 (INT78-19336)

This is a joint program between the Van Vleck Observatory of Wesleyan University, Middletown, Connecticut and the Fundacion Centro de Investigacion de Astronomia 'Francisco J. Duarte' in Merida, Venezuela, for the purpose of determining the radial velocities of groups of stars. Astronomers at the two observatories participate in the measuring, reduction and analysis of the results of the observations which are made in Venezuela. The observations consist of photographs taken with the wide-field Schmidt Telescope using an objective prism which causes each star to appear as a small spectrum. The precision of a PDS microdensitometer raster scan capabilities is being compared with more traditional but much slower machines now in use. If reliable enough, its use will increase the speed of measuring the spectral line, by an order of magnitude or more. The radial velocities of many thousands of stars can be determined only by this method. They can then be used to provide new and extensive information on the basic stellar components of our Milky Way Galaxy as well as its rotation. The new Venezuelan Schmidt Telescope has two unique advantages for this program; it is the largest in the world equipped with an objective prism and it is located near the Equator and thus can view all parts of the sky. The work contemplated is a continuation of research under a previous award, NSF No. OIP75-06683.

10.0005, PARALLAXES OF NORTHERN AND SOUTHERN STARS

A.R. Upgren, Wesleyan University, School of Science in Society, Dept. of Astronomy, *Middleton, Connecticut* 06457 (AST78-19007)

All methods for the determination of cosmic distances outside the solar system ultimately depend on trigonometric parallaxes of stars. This fundamental method is of such importance for the calibration of the distance to all objects in the Universe that its precision must be evaluated most carefully. Such parallaxes cannot be determined except over a number of years of careful observation. This program will continue analysis of the systematic and accidental errors of past parallaxes, and determine new ones as necessary to assist in this endeavor.

A systematic difference appears to exist between the stellar parallaxes observed in the Northern and Southern Hemispheres. It amounts to 0.005 plus or minus 0.001 but its cause is unknown. Since the latitudes of the northern and southern observatories differ by more than 60 degrees, an astrometric telescope located near the Equator would be helpful in resolving the difference and identifying its cause. The new 65-cm refractor now in operation near Merida, Venzuela at latitude 8 degrees 48'N will be used to make parallax observations which could resolve the difference. In addition, parallaxes of some stars of individual interest will be observed there, mostly at deep southern declinations where no precise parallaxes are presently available. Studies on the origin and nature of existing differences between observations are already in progress and form a part of this program.

10.0006, A STUDY OF THE NEEDS OF ASTRONOMY AND ASTROPHYSICS FOR THE 1980'S

B.N. Gregory, National Academy of Sciences, *2101 Constitution Ave. N.W., Washington, District of Columbia* 20037 (C-AST78-28089)

The National Research Council of the National Academy of Sciences proposes to conduct a two-year study of the needs of astronomy and astrophysics, incorporating both ground-based and space investigations, for the 1980's. The study would be concerned with all aspects of observational astronomy (understood to include all regions of the electromagnetic spectrum, from radio waves to gamma rays; particle radiations; including neutrinos and muons; and gravitational waves) and laboratory astrophysics. The field of theoretical astrophysics and relativity would also be surveyed, as well as solar physics and planetary studies. The major goal of the study would be to formulate priorities for a comprehensive program in astronomy and astrophysics for the 1980's. This would be based upon studies of the following type: a review of the influence of the Greenstein Report on the development of astronomy and astrophysics during the 1970's; and examination of the advances in facilities design, technology, and management procedures since publication of the Greenstein Report, and hence to delineate the major astronomical and astrophysical problems to be addressed in the 1980's; an assessment of the extent to which current or approved facilities and programs will be able to meet the scientific challenges of the coming decade; a determination of what new facilities and programs will be needed to meet the scientific challenges of the coming decade. A report will be submitted at the end of the study.

10.0007, OBSERVATIONAL PROGRAM IN GROUND-BASED INFRARED ASTRONOMY

E. Becklin, University of Hawaii System, Manoa Campus, Inst. for Astronomy, *2840 Kolowalu St., Honolulu, Hawaii* 96822 (AST78-26028)

An observational program in ground-based infrared astronomy using the facilities of Mauna Kea, Hawaii, Observatory will be carried out. The program will consist principally of photometric observations in the atmospheric windows between 1 and 40 microns of both galactic and extragalactic sources. Initially the program would use the 2.2-m telescope, but later would employ both the 3.8-m United Kingdom and 3-m National Aeronautics and Space Administration's infrared telescopes. Within the Galaxy the earlier Cal. Tech. work on ionized hydrogen (HII) regions and molecular clouds, with particular reference at this time to very cool infrared sources, usual HII regions and infrared reflection nebulosity will be continued. Outside of the galaxy the research will be directed to the question of the nature of the strong infrared emission from the nuclei of certain galaxies. In both programs full advantage will be taken of Mauna Kea's excellent atmospheric transmission to emphasize observations at wavelengths longward of 10 microns. These observations will be complemented with 2-10 microns mapping and photometry and 2-4 microns filter-wheel spectrophotometry. Aperture synthesis radio observations of some of our infrared sources will be made at the very large array and the Cambridge, England five kilometer telescope.

10.0008, OBSERVATIONAL STUDIES OF THE SPECTROPHOTOMETRY OF QUIESCENT SOLAR PROMINENCES

D.A. Landman, University of Hawaii System, Manoa Campus, Inst. for Astronomy, *2840 Kolowalu St., Honolulu, Hawaii* 96822 (AST78-19006)

The study of quiescent prominences is important in other problems in solar physics, solar-terrestrial relations, and in other fields of astronomy. Prominences are luminous streamers, arches, and clouds of plasma observed above the edge of the sun extending into the chromosphere and corona. The ones to be studied are those which remain relatively quiescent. A proper understanding of the conditions in these prominences will lead eventually to an accurate determination of the helium to hydrogen abundance ratio, which is otherwise difficult to determine. This value will bear ultimately on the He to H ratio of the universe, and hence on all areas of astronomy. Information will also be gained on the magnetic fields and possibly on the mechanism of coronal heating. The observations made on the oscillations and perturbations of the material as seen in the spectra can be used to investigate the dynamics of energy propagation in the inner corona. Understanding of the ionization and excitation equilibrium of the prominences remains unsatisfactory. It is the study of this problem and of the discrepancies between the previous observations and the theoretical calculations that is the goal of the research to be carried out in this project.

10.0009, ASTRONOMICAL APPLICATIONS OF NEAR-INFRARED VIDICONS

R.K. Honeycutt, Indiana University, Bloomington Campus, School of Arts & Sciences, Dept. of Astronomy, *Memorial Hall, Bloomington, Indiana* 47401 (AST79-07552)

Astronomical research in the infrared has been hampered by the low sensitivity of most available imaging devices. A low light level integrating television system was designed and built at the Los Alamos Scientific Laboratory in 1976 and later duplicated at Indiana University by the principal investigator and his co-workers. This device is based on an RCA S-1 I-SIT vidicon. It will be used for several studies including time-resolved spectroscopy of several stars being observed simultaneously in the X-ray part of the spectrum by the high energy astrophysical observatory (HEAO-A) satellite. Observations will include binary stars suspected of having acretion rings, gas shells surrounding late-type stars, objects more readily visible in the infrared that are heavily obscured by dust in the visible wavelengths, and a number of external galaxies. Images have already been obtained and others are stored at Los Alamos. These and the images to be obtained at the Goethe-Link Observatory in Indiana will be analyzed with the new image analysis system at Indiana University. To facilitate the work at Goethe-Link, several items of hardware will be obtained or constructed. The hardware includes a second microcomputer to separate the telescope control and observing functions presently shared by a single microcomputer, a stellar gas shell filter, and an automatic guider for the telescope.

10.0010, INVESTIGATIONS OF GALACTIC STRUCTURE

F.J. Kerr, University of Maryland, College Park Campus, School of Arts & Sciences, Dept. of Physics & Astronomy, *College Park, Maryland* 20742 (AST77-26898 A01)

The data from a 21-cm radio astronomy survey of the Southern Milky Way with the 64 meter Parkes telescope are being prepared for publication. The more extensive data from a companion survey with the 18 meter telescope are available as profiles, and will be in contour map form in the Spring, 1979. Some studies of these data have begun, including a new delineation of the warp of the Galaxy. A wide range of other investigations will be based on the Milky Way data. In addition, there are results from a 21-cm survey of the galactic center region. The third quadrant of galactic longitude is being studied optically and in various types of radio emission. A detailed 21-cm study of the Puppis window will be done, for comparisons between stars and gas. The results from an Arecibo Observatory study of distant spiral galaxies provide a statistically large sample of galaxies. Many of the galaxies detected at 21-cm will be photographed, in order to correlate the shape of the global profiles with features in theoretical appearance.

This is a continuation of work being done under AST-7726898.

10.0011, SOLAR FLARES AND THEIR INTERPLANETARY EFFECTS

D.M. Rust, American Science & Engineering Inc., Space Division, *955 Massachusetts Ave., Cambridge, Massachusetts* 02139 (ATM79-18412)

This grant will support the development and implementation of the scientific programs of the International Solar Maximum Year. These include the Flare Build-up Study (FBS), The Study of Energy Release in Flares (SERF) and the Study of Travelling Interplanetary Phenomena (STIP). A major goal is to identify problems that will yield to a coordinated attack by combined measurements; of the interplanetary medium, for example, and observations of solar ejections. A Science Coordinator will perform the following tasks, as formulated by the Workshop on Energy Release in Flares and endorsed by the SMY Steering Committee: (a) provide a central focus for the communication of detailed observational plans and priorities between observatories (ground and space-borne), (b) assist in the development of the plans to carry out coordinated observing sequences, and (c) assist in the coordination of the scientific goals of the individual ground and space-borne observatories toward the ultimate goal of maximizing the collective science. Coordinated observations will be carred out during approximately thirty-five 3-4 day intervals per year. Between intervals, observations received will be evaluated, the scientific programs refined and results publicized. As time allows, a particular program to study flares with eruptive filaments will be pursued. Flares with eruptive filaments invariably result in stronger inter-

planetary and geophysical disturbances than noneruptive flares and are therefore of particular interest to solar-terrestrial physics.

10.0012, HYDRODYNAMIC CONVECTION IN THE CORE HELIUM FLASH

R.G. Deupree, Boston University, School of Liberal Arts, Dept. of Astronomy, *755 Commonwealth Ave., Boston, Massachusetts* 02215 (AST79-05568)

The helium core flash is the event which signifies the thermonuclear ignition of helium in the central region of a star. The problems associated with this phenomenon are the inclusion of time-dependent turbulent convection, the interaction of the convective energy transport and the local nuclear heating, and the mixing and transport of material produced by these thermonuclear reactions.

The research to be carried out will involve calculations of the thermonuclear ignition of helium, making use of computer codes capable of carrying out the calculation in two spatial dimensions. These calculations will be aimed at defining the nature of the interaction of these features. Such calculations will provide information on the validity of techniques currently used in the treatment of convection, turbulence, and mixing.

10.0016, COMPUTER-CONTROLLED PHOTOGRAPHIC PHOTOMETRY SYSTEM

E.L. Turner, Princeton University, Graduate School, Dept. of Astrophysical Sciences, *205 Nassau Hall, Princeton, New Jersey* 08540 (AST78-22484)

This project will provide a PDS microdensitometer data acquisition facility for the Department of Astrophysical Sciences at Princeton University. The system consists of a minicomputer controlled instrument which translates photographic density (lightness and darkness) of each point in the picture. These numbers are stored on magnetic tape and later analyzed with a large computer or an interactive picture processing system. When applied to a photograph of some part of the sky taken through a large telescope, this process allows the determination of accurate brightnesses, positions in the sky, shapes, colors, etc. of various celestial objects.

The system will be a powerful facility which will be used by astronomers from Princeton as well as from other institutions in the area. Some of the projects include locating and studying galaxies outside our own. Clusters of galaxies and quasi-stellar objects will also be studied in order to answer questions concerning the nature, origin, evolution and structure of these largest and most distant objects in our universe.

10.0017, HIGH DISPERSION SPECTROSCOPIC STUDIES OF GASEOUS NEBULAE IN THE REGION FROM 4000 TO 8500 A

S.J. Czyzak, Ohio State University, Columbus Campus, School of Mathematics & Physical Sciences, Dept. of Astronomy, *164 W. 17th Ave., Columbus, Ohio* 43210 (AST76-15727 A02)

The spectrum of several planetary nebulae will be measured using sensitive equipment of the latest type. The device used will be the Schectman spectrometer mounted on the 5 meter telescope at Mt. Palomar, along with other instruments at Cerro Tololo Interamerican Observatory in Chile and Perkins Observatory in Ohio. The unique measurements to be made are accurate intensities of lines in the spectra of a few nebulae which can be used as indicators of what is to be expected in the ultra-violet spectrum of these objects. The measurement of ultraviolet light requires satellite observations, while the above observations can be done from the ground. The data obtained will improve knowledge of chemical compositions, the structure of the nebulae, and set standards with which other nebulae can be compared.

10.0018, IDENTIFICATION AND PHOTOMETRY OF QUASI-STELLAR OBJECTS IN SELECTED HIGH-LATITUDE FIELDS

P.D. Usher, Pennsylvania State University, University Park Campus, School of Science, Dept. of Astronomy, *211 Whitmore Lab., University Park, Pennsylvania* 16802 (AST78-21498)

The criterion of ultraviolet and infrared color excess and optical variability will be used to identify candidate quasi-stellar objects (QSOs) brighter than R approximately 20 magnitude in 10 Kapteyn Selected Areas at high galactic latitude. Variability and red or infrared excess will be used to separate QSOs from white dwarfs. The Selected Areas are centered on smaller faint-limit fields currently under investigation by Sandage. The research will supplement the faint-limit fields and provide further information toward problems of the isotropy and the spatial density of QSOs.

10.0019, RADIO ASTRONOMICAL OBSERVATIONS OF TWENTY-ONE CENTIMETER ABSORPTION LINES IN QUASI-STELLAR OBJECTS

A.M. Wolfe, University of Pittsburgh, School of Arts & Sciences, Dept. of Physics & Astronomy, *4200 5th Ave., Pittsburgh, Pennsylvania* 15260 (AST79-07760)

The aim of this research is to study quasi-stellar objects (QSO or quasar) absorption-line systems by observing the 21 cm wavelength line of hydrogen. The 21 cm absorption lines serve as valuable probes in the extremely distant clouds in which they form for the following reasons: 1) the detection of 21 cm and Lyman alpha absorption at the same redshift allows one to deduce the excitation temperature of the absorption gas, which is an indicator of the proximity of the absorber to the background QSO; 2) Observations of 21 cm absorption lines with very-long-baseline (VLB) interferometers reveal information about the spatial extent of the absorbing gas across scales large enough to reflect spatial and kinematical properties peculiar to a galaxy; 3) the high spectral resolution available from radio autocorrelation spectrometers permit one to record the kinematics of the absorber in detail; and 4) the coincidence of 21 cm and optical absorption lines at the same redshift lead to serve upper limits on the variations of certain physical constants over cosmological time-scales. This is a continuation of AST-7615202A01.

10.0020, INVESTIGATION OF BINARY AND MULTIPLE STARS

D.S. Evans, University of Texas, Austin Campus, School of Arts & Sciences, Dept. of Astronomy, *200 W. 21st, Austin, Texas* 78712 (AST78-22483)

Investigations will be carried out of binary, multiple and possibly some single stars, using the visual surface brightness relation established by Barnes and Evans, and some other techniques. The results should provide measures of distances of structures within our own galaxy and even possibly in the Magellanic Clouds. They should improve definition of the Barnes-Evans relation in the critical region needed for the determination of distances and absolute magnitudes of variable stars with implications for galactic structure. They should provide data leading to better understanding of the formation, rotational properties and evolution dynamics of multiple stars, and also basic data for evolution of single stars.

Prior support was by NSF grant AST 77-01360 A01.

10.0021, SPECTROSCOPIC OBSERVATIONS OF QUASI-STELLAR OBJECTS

B.J. Wills, University of Texas, Austin Campus, School of Natural Sciences, Dept. of Astronomy, *200 W. 21st St., Austin, Texas* 78712 (AST79-01182)

The University of Texas Radio Astronomy Observatory is engaged in a deep radio source survey (5000 sources per steradian), providing arc-second positional accuracy for the sources, which can then be optically identified with quasi-stellar objects (QSOs) and galaxies using even more accurate optical positions. The spectroscopic and other optical work on the identified radio sources will be continued. Telescopes at the University of Texas' McDonald Observatory, where linear detectors (a Self-Scanned Digicon and an Intensified Dissector Scanner) are now in routine operation, will be used. Principal programs include the study of large samples of bright and faint QSOs, which may be used to investigate the space density and luminosity evolution of QSOs, for quantitative statistical studies of line strengths and their dependece on redshift and other QSO properties, and for studies of interesting individual objects, such as the BL Lac-type ('lineless') objects, the extremely compact N galaxies and Seyfery-type nuclei, and QSOs with complex absorption-line spectra. Monitoring the emission-line strengths of some optically-variable QSOs, to constrain models of the geometry and physical conditions that occur in the broad line regions, will be continued. This work is a continuation of AST-7681338A01.

TECHNOLOGY REQUIREMENTS AND READINESS FOR VERY LARGE AIRCRAFT
D. William Conner and John C. Vaughan, III Mar. 1980 14 p refs
(NASA-TM-81783) Avail: NTIS HC A02/MF A01 CSCL 01B

Common concerns of very large aircraft in the areas of economics, transportation system interfaces and operational problems were reviewed regarding their influence on vehicle configurations and technology. Fifty-four technology requirements were identified which are judged to be unique, or particularly critical, to very large aircraft. The requirements were about equally divided among the four general areas of aerodynamics, propulsion and acoustics, structures, and vehicle systems and operations. The state of technology readiness was judged to be poor to fair for slightly more than one-half of the requirements. In the classic disciplinary areas, the state of technology readiness appears to be more advanced than for vehicle systems and operations.

DETECTION OF THE TRANSITIONAL LAYER BETWEEN LAMINAR AND TURBULENT FLOW AREAS ON A WING SURFACE Patent
William R. Hood Issued 19 Feb. 1980 4 p Filed 27 Nov. 1978 Supersedes N79-16805 (17 - 08, p 0932)
(NASA-Case-LAR-12261-1; US-Patent-4,188,823; US-Patent-Appl-SN-964009; US-Patent-Class-73-147; US-Patent-Class-73-205L) Avail: US Patent and Trademark Office CSCL 01A

A system is disclosed for detecting the laminar to turbulent boundary layer transition on a surface while simultaneously taking pressure measurements. The system uses an accelerometer for producing electrical signals proportional to the noise levels along the surface and a transducer for producing electrical signals proportional to pressure along the surface. The signals generated by the accelerometer and transducer are sent to a data reduction system for interpretation and storage.

EXAMPLE OF PERFORMANCE ANALYSIS USING DATA OBTAINED CONCURRENTLY IN AIR-PATH, BODY AND EARTH AXES
1979 31 p
(ESDU-79018; ISBN-0-85679-263-2) Copyright. For information on availability of series, sub-series, and other individual data items, write NTIS, Attn: ESDU, Springfield, Va. 22161. HC $674.50

A detailed work example of the application of the equations of motion to the solution of problems in aircraft point-performance work involving the use of several axis systems is presented. The example is the determination of lift and drag for a supersonic-cruise aircraft using data from air-data systems, bodymounted accelerometers and an inertial platform system. A particular feature is the extent to which account is taken of quantities which individually might be regarded as negligible but whose collective effects in an attempted high-accuracy analysis can be significant.

STABILITY AND TRANSITION OF WAVE INDUCED BOUNDARY LAYER FLOWS Ph.D. Thesis
Yehia Mahmoud Amr 1979 157 p
Avail: Univ. Microfilms Order No. 8005630

A theoretical investigation of stability and an experimental investigation of transition of wall boundary layers developed within unsteady plane expansion waves and behind shock waves traveling into a gas at rest are discussed. The theoretical investigation involved three tasks: the use of approximate methods for the prediction of critical Reynolds numbers, a numerical integration of the Orr-Sommerfeld equation for the incompressible boundary layer flow at the expansion wave head, and the development of a multiple scales technique for nearly quasisteady, quasiparallel boundary layer flows. Thin film surface thermometers, flush hot film anemometers, and hot wire anemometers were used independently and simultaneously to detect boundary layer transition.

A SPIN-RECOVERY PARACHUTE SYSTEM FOR LIGHT GENERAL-AVIATION AIRPLANES
Charles Bradshaw Apr. 1980 18 p refs Presented at the 14th Aerospace Mech. Symp., Hampton, Va. 1-2 May 1980 Submitted for publication
(NASA-TM-80237; L-13585) Avail: NTIS HC A02/MF A01 CSCL 01A

A tail mounted spin recovery parachute system was designed and developed by the NASA Langley Research Center for use on light general aviation airplanes. The system was designed for use on typical airplane configurations, including low wing, single engine, and twin-engine design. A mechanically triggered pyrotechnic slug gun is used to forcibly deploy a pilot parachute which extracts a bag that deploys a ring slot spin recovery parachute. The total system weighs 8.2 kg (18 lb). System design factors included airplane wake effects on parachute deployment, prevention of premature parachute

deployment, positive parachute jettison, compact size, low weight, system reliability, and pilot and ground crew safety. Extensive ground tests were conducted to qualify the system. The recovery parachute was used successfully in flight 17 times. J.M.S.

TRANSONIC UNSTEADY AIRLOADS ON AN ENERGY EFFICIENT TRANSPORT WING WITH OSCILLATING CONTROL SURFACES
M. C. Sandford, R. H. Ricketts, F. W. Cazier, Jr., and H. J. Cunningham. Feb. 1980. 9 p.
(NASA-TM-81788) Avail: NTIS HC A02/MF A01 CSCL 01A

An aspect ratio 10.8 supercritical wing with oscillating control surfaces is described. The wing is instrumental with 252 static orifices and 164 in situ dynamic pressure transducers for studying the effects of control surface deflection on steady and unsteady pressures at transonic speeds. Results from initial wind tunnel tests conducted in the Langley Transonic Dynamics Tunnel are discussed. Unsteady pressure results are presented for two trailing edge control surfaces oscillating separately at the design Mach number of 0.78. Some experimental results are compared with analytical results obtained by using linear lifting surface theory. Author

WAKE FLOWFIELDS FOR JOVIAN PROBE. Final Report
Carl D. Engel and Leroy M. Hair. Hampton, Va. NASA Langley Research Center. Mar. 1980. 62 p. refs.
(Contract NAS1-15819)
(NASA-CR-159235) Avail: NTIS HC A04/MF A01 CSCL 01A

The wake flow field developed by the Galileo probe as it enters the Jovian atmosphere was modeled. The wake produced by the probe is highly energetic, yielding both convective and radiative heat inputs to the base of the probe. A component mathematical model for the inviscid near and far wake, the viscous near and far wake, and near wake recirculation zone was developed. Equilibrium thermodynamics were used for both the ablation and atmospheric species. Flow fields for three entry conditions were calculated. The near viscous wave was found to exhibit a variable axial pressure distribution with the neck pressure approximately three times the base pressure. Peak wake flow field temperatures were found to be in proportion to forebody post shock temperatures. J.M.S.

OPERATIONAL IMPLICATIONS OF SOME NACA/NASA ROTARY WING INDUCED VELOCITY STUDIES
Harry H. Heyson. Feb. 1980. 53 p. refs. Presented at 3d Midwest Helicopter Safety Seminar, Joliet, Ill., 26-27 Feb., 1980; sponsored by FAA and Ill. Dept. of Transportation.
(NASA-TM-80232) Avail: NTIS HC A04/MF A01 CSCL 01A

Wind tunnel measurements show that the wake of a rotor, except at near-hovering speeds, is not like that of a propeller. The wake is more like that of a wing except that, because of the slow speeds, the wake velocities may be much greater. The helicopter can produce a wake hazard to following light aircraft that is disproportionately great compared to an equivalent fixed-wing aircraft. This hazard should be recognized by both pilots and airport controllers when operating in congested areas. Even simple momentum theory shows that, in autorotation and partial-power descent, the required power is a complex function of both airspeed and descent angle. The nonlinear characteristic, together with an almost total lack of usable instrumentation at low airspeeds, has led to numerous power-settling accidents. The same theory shows that there is a minimum forward speed at which a rotor can autorotate. Neglect of, or inadequate appraisal of this minimum speed has also led to numerous accidents. Ground effect and the problems it creates is discussed. R.E.S.

AERODYNAMIC DESIGN AND ANALYSIS OF THE AST-204, AST-205, AND AST-206 BLENDED WING-FUSE LARGE SUPERSONIC TRANSPORT CONFIGURATION CONCEPTS
Glen L. Martin and Kenneth B. Walkley. Mar. 1980. 49 p. refs.
(Contract NAS1-16000)
(NASA-CR-159223) Avail: NTIS HC A03/MF A01 CSCL 01A

The aerodynamic design and analysis of three blended wing-fuselage supersonic cruise configurations providing four, five, and six abreast seating was conducted using a previously designed supersonic cruise configuration as the baseline. The five abreast configuration was optimized for wave drag at a Mach number of 2.7. The four and six abreast configurations were also optimized at Mach 2.7, but with the added constraint that the majority of their structure be common with the five abreast configuration. Analysis of the three configurations indicated an improvement of 6.0, 7.5, and 7.7 percent in cruise lift-to-drag ratio over the baseline configuration for the four, five, and six abreast configurations, respectively. LASER-RAMAN MEASUREMENTS IN A DUCTED, TWO-STREAM, SUBSONIC, H2/AIR COMBUSTION FLOW. Final Report, 6 Sep. 1978 - 13 Aug. 1979
W. D. Williams, H. M. Powell, L. L. Price, and G. D. Smith. AEDC. Dec. 1979. 63 p. refs. Sponsored by AF.
(AD-A078112; AEDC-TR-79-74) Avail: NTIS HC A04/MF A01 CSCL 20/5

The laser-Raman diagnostic technique has been used for investigating a ducted, two-stream, subsonic, H2/air combustion flow with turbulent jet mixing and recirculation. A primary jet of high-velocity air was surrounded by an outer, low-velocity hydrogen stream. The duct-to-inner-nozzle diameter ratio was varied. The ratios were 2 and 10 for the two conditions investigated. The radial distributions of static temperature and species number densities were determined at several axial positions for each test condition. GRA

INVESTIGATION OF NUMERICAL TECHNIQUES FOR PREDICTING AERODYNAMIC HEATING TO FLIGHT VEHICLES. Final Report, May 1976 - Sep. 1977
Arthur B. Lewis, Jr. and Neil J. Sloski. May 1979. 120 p. refs. (AF Proj. 2404)
(AD-A078121; AFFDL-TR-79-3001) Avail: NTIS HC A06/MF A01 CSCL 20/4

The development of complex lifting configurations and high speed maneuvering vehicles has emphasized the need for numerical techniques to predict aerodynamic heating rates as a function of the vehicle trajectory. These numerical programs are not expected to eliminate the requirements for wind tunnel and flight testing, but will be an aid to more efficient use of experimentation time and improve confidence that all potential problem areas on the vehicle have been examined. Three programs, the Hypersonic Arbitrary Body Program, the MINIVER Program, and a third program were examined to determine their usefulness for vehicles with non-circular cross sections and large flat areas as exemplified by lifting reentry vehicles. The MINIVER code was found to be unsuitable for this; the Hypersonic Arbitrary Body Program was applicable to these shapes, but because of program limitations was used for only limited calculations. The last program also had limitations in the areas of geometry description and surface pressure calculations. Efforts were made

to remove these limitations and several shapes were investigated. The ultimate goal of this effort was to extend the capabilities of one or more of the heating codes; while no effort was made to improve MINIVER or the Hypersonic Arbitrary Body Program, significant improvements were made in the last program and inviscid flow field program. GRA

AERODYNAMIC CHARACTERISTICS AND STORE LOADS OF THE 1/24-SCALE F-111 AIRCRAFT MODEL WITH SEVERAL EXTERNAL STORE LOADINGS Final Report, 18-23 Jun. 1979
C. F. Anderson AEDC Aug. 1979 48 p
(AD-A078677; AEDC-TSR-79-P48) Avail: NTIS
HC A03/MF A01 CSCL 20/4

The 1/24-scale F-111 aircraft model was tested to obtain simultaneous measurements of the aircraft and store aerodynamic loads and to evaluate the effects of the TAWDS pod on aircraft stability and control. Static stability and store loads data were obtained at 5 wing sweep angles for Mach numbers from 0.4 to 1.2. Data were also obtained for stabilizer deflections of + or - 10 deg and with the speed brake deflected 50 deg for some configurations. The angle of attack range was from -2 to 24 deg and the angle of sideslip range was from -10 to 10 deg. GRA

THE DEVELOPMENT OF RAPID PREDICTIVE METHODS FOR THREE-DIMENSIONAL TRANSONIC FLOW FIELDS ABOUT FIGHTER BOMBER AIRCRAFT, PART 1 Final Report, 1 Jan. 1975 - 30 Sep. 1979
Anthony J. Crisalli, Stephen S. Stahara, Jack N. Nielsen, and John R. Spreiter Jul. 1979 314 p refs
(Contract F44620-75-C-0047; AF Proj. 2307)
(AD-A078683; NEAR-TR-198; AFOSR-79-1281TR) Avail: NTIS HC A14/MF A01 CSCL 20/4

This report presents an overall account of the progress made on an essential component of the transonic store trajectory problem: the predicton of transonic flow fields about wing-body/pylon combinations representative of modern fighter-bomber aircraft. The emphasis here is on the development of predictive techniques which are sufficiently economical from the standpoint of computer cost to enable an aircraft designer to employ the techniques over a wide range of Mach number, angle of attack, and geometric parameters. The report presents several candidate transonic predictive methods and evaluates them by comparing their predictions of various flow field quantities with experimental data. The experimental data are taken from a parallel wind-tunnel test phase of the project, designed specifically for evaluating the predictive methods. The experimental data have been documented and archived in several test reports. The extensive comparisons of the theoretical predictions from the various predictive methods with the data comprise the major portion of this report. GRA

GROUND PLANE EFFECTS ON A CONTOURED SURFACE AT LOW SUBSONIC VELOCITIES M.S. Thesis
J. A. Krawtz Dec. 1979 115 p refs
(AD-A079877; AFIT/GA/AA/80M-3) Avail: NTIS
HC A06/MF A01 CSCL 20/4

The wing-in-ground effect phenomenon was examined by investigating the flow between a flat ground plate and a contoured upper plate. Velocity and turbulence intensity measurements were taken at various points in the flow with a Laser Doppler Velocimeter. Mach numbers studied were Mach 0.15 and Mach 0.2 at the exit plane of a 1 cm by 10 cm two-dimensional nozzle. Measurements were taken across the width of the jet, 5, 10, and 15 cm downstream with plate separations of 1, 2, and 5 cm and vertically without the ground plate. In addition measurements were taken near the top plate with conventional pressure measuring techniques and the results compared. The proximity of the ground plate had the effect of spreading the flow outward across the 10 cm width of the jet by 20%. The laser velocimeter showed the turbulence intensity to be constant across the potential core of the jet. Turbulence intensity increased beyond 10% in the boundary layers of the jet and in the plate boundary layer. The pressure measurement data correlated well with the laser velocimeter results. GRA

HC A03/MF A01 CSCL 20/4

A brief review of the unsteady aerodynamics in lifting surface theory is reported. For utility in design application, simplified but accurate analytical expressions were developed for generalized unsteady aerodynamics of wings of finite aspect ratio and sweep. This includes a means of calculating the unsteady lift load on the wing and tail surface of arbitrary shape and angle of attack variation. In addition, a formulation to include the indicial aerodynamics in the longitudinal equations of motion of the aircraft was performed. Sample numerical solutions to the longitudinal equations for a step input in elevator deflection are presented for the Navion aircraft. From these calculations, a noted difference in angle of attack and pitch rate response can be seen for the cases of unsteady and quasi-steady aerodynamics. The apparent increase in damping effects in the aircraft response due to the unsteady aerodynamics indicate that various design constraints might be relaxed somewhat if the unsteady aerodynamics is modeled properly. (AD-A080073; AFOSR-80-0034TR) Avail: NTIS
HC A02/MF A01 CSCL 20/4

The present contract continues an earlier one which extended from 1970-1976, F44620-70-C-0085. The purpose of this continued action was to make pioneering calculations of genuine three-dimensional laminar boundary layers. During the current contract period, efforts were first focused on investigations of: (1) the general characteristics of three-dimensional flow separation, especially for aerospace applications and (2) the boundary layer features and the magnus forces on spinning bodies such as spinning projectiles or missiles. Later emphasis gradually shifted to the boundary layer over an aircraft wing in contrast to that around a body of revolution studied theretofore. GRA

HC A06/MF A01 CSCL 01/2

The development and testing of airborne displays, instrumentation, and procedures for aiding an airline jet transport pilot to cope with wind shear on approach and landing and on takeoff were studied. The task involved analysis of wind shear effects, development of wind models including shear and turbulence, specification of displays and instrument models, and conduct of six large scale piloted flight simulation exercises. A set of candidate standard wind shear models was developed. The beneficial effects of training in a moving base simulator were noted. Tests on the pilot aiding systems were conducted on both wide bodied (DC-10) and nonwide bodied (B-727) aircraft. The aiding systems tested included approach management techniques, go around decision aids, techniques for assisting the pilot during the go around maneuver, and head up displays. The operational and technical role of head up displays during flight operations with wind shear is emphasized. A.W.H.

(AD-A080588; FAA-RD-79-119) Avail: NTIS
HC A05/MF A01 CSCL 01/2

Mathematically modeled and measured wind data represented as a function of both aircraft altitude and distance were flown with a fast-time computer model piloted by an idealized controller. The wind models and the runway position relative to each wind field were systematically varied to produce a number of different wind profiles. Relative comparisons of wind profile severity were made, based on aeronautical system performance in the computer. Potentially hazardous wind profiles were identified, and their relative severity designated as low, moderate, or high for purposes of piloted simulator tests. The piloted simulation results were used to verify the severity ratings. Effects of wind shear on aircraft are illustrated using simplified examples and then correlated with wind profile characteristics. Wind profile design techniques and implementation methods are discussed, and a set of candidate standard wind profiles is recommended. The results of the wind shear hazard determination indicate that the severity of a wind shear encounter is dependent on the position and alignment of the approach path with respect to the wind field and on the timing of the encounter, and that both wind shear in the vertical wind component and wind shear in the longitudinal wind component can produce a hazardous condition. High severity wind shear is also found to be hazardous on takeoff. J.M.S.

Sampling efficiencies for water drops in the diameter range 10 to 7000 microns are calculated theoretically at four proposed mounting sites for an icing indicator instrument on the wing tip of the AFGL MC130E airplane. Significant flux distortion of droplets in the diameter range 10 to 100 microns is indicated at all four sites. Sensitivity to angle-of-attack of the airplane also is found, and a nose-up angle-of-attack of at least 4 deg is recommended. Additional separation of the sensor probe from the wing tip surface of as little as one-half inch is indicated to substantially ameliorate the sampling problems. To obtain the sampling efficiencies, trajectories were calculated with use of a three-dimensional flow code that ignores effects of lift vorticity. Exploratory calculations with a similar code that includes lift indicate that the results obtained with the non-lifting flow are optimistic. GRA

F-4 PHANTOM AIRCREW SURVIVAL EQUIPMENT EVALUATION M.S. Thesis Final Report
William Edgar Lindsay 8 Jun. 1979 120 p refs
(AD-A076330) Avail: NTIS HC A06/MF A01 CSCL 06/7

The F-4 Phantom aircraft is equipped with an ejection seat which has space provided in a seat kit for the carriage of aircrew survival equipment. This study evaluated the utilization of this space and the equipment available for inclusion in this kit. The space is not being filled with appropriate equipment in many instances because the required density of the packed kit is too great, requiring local units to pack lead shot instead of survival equipment. The survival equipment available to the aircrew in the seat kit is generally of good quality and sound theoretical design. However, there are many areas in which the equipment has not been redesigned to use current technology and thus provide more and better equipment in a smaller space. Additionally, the average survival kit lacks the cold weather survival protective equipment required to sustain the downed aircrew member. This study contains specific recommendations for equipment redesign and selection for the F-4 survival seat pack. GRA

DEVELOPMENT OF A BIRD/AIRCRAFT STRIKE HAZARD ASSESSMENT METHODOLOGY M.S. Thesis
Jeffrey M. Jorgensen and Kent G. Smith Sep. 1979 80 p refs
(AD-A075584; AFIT-LSSR-10-79B) Avail: NTIS
HC A05/MF A01 CSCL 13/12

This thesis effort was an attempt to identify a managerial tool that could be used to make decisions when comparing alternative methods of reducing bird/aircraft strike hazards. The general theory was that there should be certain identifiable factors present on a base that affect the probability of a bird/aircraft strike. A relationship was developed by using information from several bases which related to their environment and aircraft operating procedures. Using multiple linear regression, a model was developed to explain how the base's strike rate is affected by these factors. The effort resulted in several conclusions and recommendations that could be used in further research efforts in this area of utmost importance to the Air Force. GRA

NOWCAST AND SHORT-RANGE (0-2 HOUR) FORECASTS OF THUNDERSTORMS AND SEVERE CONVECTIVE WEATHER FOR USE IN AIR TRAFFIC CONTROL Final Report, Apr. 1978 - Nov. 1979
Mikhail A. Alaka, Robert C. Elvander, and Robert E. Saffle Nov. 1979 41 p refs
(Contract DOT-FA78WAI-886; FAA Proj. 152-461-01)
(AD-A080426; FAA-RD-79-98) Avail: NTIS HC A03/MF A01 CSCL 17/7

The development of improved automated techniques for monitoring and forecasting thunderstorms and severe local convective weather at and around air terminals is discussed. The products being developed are intended primarily for air traffic controllers. Weather radars with automatic signal digitizing capability are evaluated. The radar data processor (RADAP) which includes a minicomputer, color graphic and alphanumeric display devices, and communication ports is highlighted in the evaluation. The project D/RADEX (digitized radar experiment) is described. The D/RADEX network offers an interim means to develop and evaluate radar data processing techniques that are aimed for RADAP implementation. A.W.H.

INERTIALLY AUGMENTED APPROACH COUPLERS Final Report, Jun. 1975 - Jun. 1979
D. A. Tiedeman, F. B. Benson, L. V. Miller, R. J. Rudig, T. J. Schuldt, C. P. Shih, and E. D. Skelley Jun. 1979 131 p refs
(Contract DOT-FA75WA-3650; SRI Proj. 4364)
(AD-A080488; FAA-RD-79-118) Avail: NTIS HC A07/MF A01 CSCL 01/2

The results of a series of engineering design studies and tests of methods for acceleration augmentation of airplane control systems for approach and landing are presented. Emphasis is on the use of body-mounted accelerometers, which are reasonably inexpensive. Control laws were developed for several aircraft (CV-880, DC-10, B-727) and tested by simulation with both automatic and human pilots and include automatic landing systems, flight director with full ILS, and flight director for nonprecision approach. The modified flight director (MFD) control algorithms (pitch, roll, and thrust) were also tested in large-scale piloted flight simulations. Approach and landing performance on Category 1 and 2 ILS beams comparable to that with current systems on Category 3 beams was achieved along with improved performance over current systems in coping with low level wind shear. Performance comparable to that attainable with an expensive full inertial navigation system was demonstrated. J.M.S.

IMPROVED SUN-SENSING GUIDANCE SYSTEM FOR HIGH-ALTITUDE AIRCRAFT Patent Application
Robert D. Reed, inventor (to NASA) Filed 12 Mar. 1980 17 p
(NASA-Case-FRC-11052-1; US-Patent-Appl-SN-129783) Avail: NTIS HC A02/MF A01 CSCL 17G

A Sun sensing guidance system for high altitude aircraft is described. The system is characterized by a disk shaped body mounted for rotation aboard the aircraft in exposed relation to solar radiation and has a plurality of mutually isolated chambers. The photosensors are arranged in facing relation with the chamber openings for receiving incident solar radiation and responsively providing a voltage output. The photosensors are connected in a paired relation through a bridge circuit for providing heading error signals in response to detected imbalances in intensities of solar radiation incident on the photosensors of either pair of photosensors until a nulled relationship is achieved for the disk to the source of radiation. ANALYSIS OF FIRST AND SECOND ORDER BINARY QUANTIZED DIGITAL PHASE-LOCKED LOOPS FOR IDEAL AND WHITE GAUSSIAN NOISE INPUTS
Paul R. Blasche 31 Mar. 1980 127 p
(Grant NGR-36-009-017)
(NASA-CR-162841; TM-75) Avail: NTIS HC A07/MF A01 CSCL 17G

Specific configurations of first and second order all digital phase-locked loops are analyzed for both ideal and additive white Gaussian noise inputs. In addition, a design for a hardware digital phase-locked loop capable of either first or second order operation is presented along with appropriate experimental data obtained from testing of the hardware loop. All parameters chosen for the analysis and the design of the digital phase-locked loop are consistent with an application to an Omega navigation receiver although neither the analysis nor the design are limited to this application. SIMULATION OF A NAVIGATOR ALGORITHM FOR A LOW-COST GPS RECEIVER
Ward F. Hodge Feb. 1980 23 p refs
(NASA-TM-81778) Avail: NTIS HC A02/MF A01 CSCL 17G

The analytical structure of an existing navigator algorithm for a low cost global positioning system receiver is described in detail to facilitate its implementation on in-house digital computers and real-time simulators. The material presented includes a simulation of GPS pseudorange measurements, based on a two-body representation of the NAVSTAR spacecraft orbits, and a four component model of the receiver bias errors. A simpler test for loss of pseudorange measurements due to spacecraft shielding is also noted. Author

AIRBORNE ELECTRONIC TERRAIN MAP SYSTEM: A LITERATURE REVIEW
Gilbert G. Kuperman (AMRL) and Anthony J. DeFrances Wright-Patterson AFB, Ohio AMRL Oct. 1979 59 p refs
(Contract F33615-79-C-0503; AF Proj. 7184; AF Proj. 2003)
(AD-A079402; AMRL-TR-79-92) Avail: NTIS HC A04/MF A01 CSCL 17/7

Currently, the United States Air Force is placing significant emphasis on low-altitude high-speed profiles for tactical aircraft survivability. In order to execute these terrain avoidance profiles, pilots require an efficient and credible source of terrain relief information for both accurate and safe navigation and to alleviate the high workload associated with the primary pilotage function. This report highlights many of the limitations of current airborne sources of cartographic information and describes a viable alternative--the Airborne Electronic Terrain Map System (AETMS). The AETMS consists of an in-the-cockpit, computer-generated, wide-area terrain map display, capable of providing forward-looking perspective and/or planimetric information. Because of the large integrated data base, real-time information source for many mission segments is provided. The system is totally self-contained and passive, which precludes the possibility of jamming and reduces detection probability. GRA

COMBINED PSEUDO RANGE AND DOPPLER POSITIONING FOR THE STATIONARY NAVSTAR USER Final Report
Paul S. Jorgensen Mar. 1979 46 p
(Contract F04701-78-C-0079)
(AD-A079543; TR-0079-4475-01-03; SAMSO-TR-79-79) Avail: NTIS HC A03/MF A01 CSCL 17/7

An early success in testing NAVSTAR user equipment was achieved with the Manpack receiver. Using only two satellites, NAVSTARS 1 and 2, the receiver accurately performed two-dimensional positioning while stationary. It was, in effect, combining pseudo range and integrated Doppler data. This concept of combining both types of data can be extended to three dimensions and to the operational phase 3 NAVSTAR. The stationary user can accomplish three-dimensional navigation with only three satellites. This capability is of interest to the Army since it would permit the stationary use of NAVSTAR with much greater elevation mask angles. With the baseline 24-satellite constellation, three-dimensional navigation can be accomplished with a 30-deg mask angle, but it will take a few minutes longer because of the extra time required for making integrated Doppler measurements. Using this technique, three-dimensional position will be obtained to within 16 meters about 90 percent of the time. This operational capability will enhance the Army's ability to use NAVSTAR in the presence of jamming, foliage, and terrain. GRA

OPTIMAL FLOW CONTROL OF AIR TRAFFIC Final Report
William J. Dunlay, Jr. and W. Bruce Allen Aug. 1979 155 p refs
(Contract DOT-OS-70065)
(PB80-105976; DOT-DPA-RSPA-50-79/15) Avail: NTIS HC A08/MF A01 CSCL 17G

Flow control procedures for air traffic initiated during periods of unusually high demand or low capacity are discussed. Aspects of flow control which are addressed include forecasting of demand and capacity, forecasting of congestion, and assignment of delays and landing and departure priorities. In particular, the demand capacity-buffer relationship is explored, with emphasis on improvement of forecasts and evaluation of their accuracy. It is shown that buffer size, which represents the excess number of aircraft in the airspace due to delays, can be estimated recursively and then forecasted on the basis of arrival forecasts and the number of landings recorded. Regression analysis is used to describe and predict flow rates of arrivals and departures. GRA

A SINGULAR PERTURBATION ANALYSIS OF MINIMUM TIME LONG RANGE INTERCEPT Final Report
Anthony J. Calise Jan. 1980 50 p refs
(Grant NsG-1496)
(NASA-CR-162895) Avail: NTIS HC A03/MF A01 CSCL 01C

The application of singular perturbation theory for deriving algorithms suitable for on board real time computation of optimal aircraft trajectory control was investigated. Minimum time intercept in three dimensions was selected as a pilot problem formulation, and data for an early version F-4 aircraft was used to represent aircraft aerodynamic and propulsion characteristics. Results include

the derivation of nonlinear, near optimal feedback control laws that are readily implementable in an aircraft flight computer, performance results for a variety of initial conditions (including optimal intercept at short ranges), and a point mass three dimensional simulation suitable for representing fighter aircraft under closed loop optimal control. Avail: NTIS HC A05/MF A01 CSCL 01/3

This report consists of three volumes and documents the current version in the C81 family of rotorcraft flight simulation programs developed by Bell Helicopter Textron. This current version of the digital computer program is referred to as AGAJ77. The accompanying program for calculating fully coupled rotor blade mode shapes is called DNAMO5, and the rotor wake program is called AR9102. The first volume, the Engineer's Manual, presents an overview of the computer program capabilities plus discussions for the background and development of the principal mathematical models in the program. The models discussed include all those currently in the program. Volume 2, the User's Manual, contains the detailed information necessary for setting up an input data deck and interpreting the computed data. Volume 3, the Programmer's Manual, includes a catalog of subroutines and a discussion of programming considerations. The source tapes and related software for the computer programs documented in this report are unpublished data on file at the Applied Technology Laboratory, U.S. Army Research and Technology Laboratories (AVRADCOM), Fort Eustis, Virginia. ADVANCED FIREFLY ASSESSMENT GENERALIZED MECHANIZATION REQUIREMENTS REPORT Interim Report, 25 Oct. 1978 - Feb. 1979
S. J. Asseo Wright-Patterson AFB, Ohio AFAL Jun. 1979 112 p refs
(Contract F33615-78-C-1503; AF Proj. 7629)
(AD-A079752; AFAL-TR-79-1092) Avail: NTIS HC A06/MF A01 CSCL 19/5

The requirements for the design of the Generalized Mechanization of the FIREFLY concept of Integrated Fire and Flight Control to be implemented in a digital simulation has been completed. This generalized mechanization consists of a set of equations, algorithms, and control laws capable of being programmed into an airborne digital computer which can be specialized to perform successfully in a variety of tactical aircraft with differing avionics sensors, fire control algorithms, control laws, flight control systems, and weapon delivery modes. The document first addresses the scope of the requirements analysis followed by a description of the analysis done in deriving the requirements of the generalized mechanization. Finally, the requirements are summarized in a section discussing them explicitly in relation to their place in the overall fire control system. A discussion of the work done on the FIREFLY 2 familiarization and initial analysis of two of the potential advanced concepts for evaluation is contained in the appendices. GRA

EVALUATION OF PACKAGING FOR THE CN-1325/ASN-108 AHRS DISPLACEMENT GYRO, F-15 AIRCRAFT Final Report
Frank C. Jarvis Sep. 1979 17 p
(AD-A078707; PTPT-79-15) Avail: NTIS HC A02/MF A01 CSCL 13/4

The packaging evaluation of the CN-1325/ASN-108 AHRS Displacement Gyro (F-15) revealed that the pack is not adequate to provide the 15 G shock protection level required for this item. The field tests confirmed the laboratory results which produced a maximum impact force of 21 Gs. A prototype pack with corner pad cushion inserts was evaluated and found to be suitable as an interim or a permanent replacement for packaging this item. GRA

N80-20265# Army Aviation Engineering Flight Activity, Edwards AFB, Calif.
PRELIMINARY AIRWORTHINESS EVALUATION, AH-1G WITH THE AIRBORNE TARGET ACQUISITION FIRE CONTROL SYSTEM AND THE HELLFIRE MODULAR MISSILE SYSTEM INSTALLED Final Report, Jun. 1978 - Jan. 1979
Patrick J. Moe and Raymond B. Smith Jul. 1979 43 p refs
(AD-A078340; USAAEFA-78-02) Avail: NTIS HC A03/MF A01 CSCL 19/5

The AH-1G helicopter with the HELLFIRE modular Missile System (HMMS) and the Airborne Target Acquisition Fire Control System (ATAFCS) is being used as a surrogate trainer for the YAH-64 helicopter. The United States Army Aviation Engineering Flight Activity was tasked to provide quantitative and qualitative data on the handling qualities of the helicopter, obtain limited level flight performance data, and obtain limited handling qualities of the helicopter with only the ATAFCS installed. The test helicopter was a production AH-1G helicopter (212 tail rotor) modified with an ATAFCS mockup and carrying eight HELLFIRE missiles. Six productive flight test hours were flown in six flights. No shortcomings or deficiencies attributable to HMMS and ATAFCS installation were found. The AH-1G helicopter, with HMMS and ATAFCS installed, exhibits an additional equivalent flat plate area of 4.0 sq ft compared to the standard AH-1Q helicopter. The handling qualities of the helicopter with only the ATAFCS installed are essentially the same as the production AH-1G helicopter. GRA

DEVELOPMENT OF A COLOR ALPHANUMERIC LIQUID CRYSTAL DISPLAY Final Report, 1 Oct. 1977 - 20 May 1979
J. E. Gunther Warminster, Pa. NADC Dec. 1979 39 p refs
(Contract N62269-77-C-0477)
(AD-A079289; HAC-E0122; HAC-P90440; NADC-77212-30)
Avail: NTIS HC A03/MF A01 CSCL 01/3

This report encompasses efforts directed toward the development of a multicolor liquid crystal display suitable for aircraft command and control applications. The approach taken was to combine a striped, color-selective filter with previously developed matrix liquid crystal display technology. Two 1.75 x 1.75 inch displays and one set of LSI drive circuits were constructed. The displays provided 100 elements per inch horizontal resolution and 33 elements per inch vertical resolution, with each vertical element consisting of a red-green-blue triad. While the optical performance of the displays was limited, sufficient information was gained to ensure adequate viewability in subsequent designs. GRA

A STUDY OF TWO AVIONICS LIFE CYCLE COST MODELS AND THEIR APPLICABILITY IN THE COMMUNICATIONS-ELECTRONICS-METEOROLOGICAL ENVIRONMENT M.S. Thesis
Nicholas J. Drobot and Martin H. Johnson Sep. 1979 159 p refs
(AD-A076981; AFIT/GSM/SM/79S-5) Avail: NTIS HC A08/MF A01 CSCL 14/1

This study determines the applicability of Life Cycle Cost (LCC)/Logistic Support Cost (LSC) models in the CEM environment. The scope of this study addresses two of the models identified (LSC, PRICE) with respect to three Air Force TACAN systems. A methodology is developed to evaluate each model based on the five desirable model characteristics: availability of input data, validity, sensitivity, completeness, and documentation. The results presented are also framed within the above model characteristics. The most important model characteristic, validity, is accessed by comparison with an AFCS cost study of NAVAIDs equipment. Based on the methodology, the results indicate that both models are applicable in the present and future CEM environment. GRA

AN OPERATING AND SUPPORT COST MODEL FOR AVIONICS AUTOMATIC TEST EQUIPMENT M.S. Thesis
Joel A. Guerra, Andrew J. Lesko, and Jose G. Pereira Sep. 1979 181 p refs
(AD-A075586; AFIT-LSSR-21-79B) Avail: NTIS HC A09/MF A01 CSCL 14/1

One of the fastest growing elements of weapon system support equipment which relates directly to Operating and Support (O and S) costs is Automatic Test Equipment (ATE). The importance of ATE has expanded to such a degree that it requires additional management attention. The importance is exemplified by the $600 million projected development and acquisition costs of ATE for the F-16. This amount of cost qualifies the F-16 ATE for major program status. This thesis documents the development of a model to estimate and measure O and S costs for Avionics ATE. The model will be an important addition to the tools used in ATE Life Cycle Costing (LCC) techniques. It is envisioned primarily as an evaluation tool to be used in ATE source selection, but may also be useful in various design trade-off studies. GRA

07 AIRCRAFT PROPULSION AND POWER

Includes prime propulsion systems and systems components, e.g., gas turbine engines and compressors; and on-board auxiliary power plants for aircraft.

A 150 AND 300 kW LIGHTWEIGHT DIESEL AIRCRAFT ENGINE DESIGN STUDY Final Report
Alex P. Brouwers Apr. 1980 149 p refs
(Contract NAS3-20830)
(NASA-CR-3260; Rept-756) Avail: NTIS HC A07/MF A01 CSCL 21A

The diesel engine was reinvestigated as an aircraft powerplant through design study conducted to arrive at engine configurations and applicable advanced technologies. Two engines are discussed, a 300 kW six-cylinder engine for twin engine general aviation aircraft and a 150 kW four-cylinder engine for single engine aircraft. Descriptions of each engine include concept drawings, a performance analysis, stress and weight data, and a cost study. This information was used to develop two airplane concepts, a six-place twin and a four-place single engine aircraft. The aircraft study consists of installation drawings, computer generated performance data, aircraft operating costs, and drawings of the resulting airplanes. The performance data show a vast improvement over current gasoline-powered aircraft. R.E.S.

EFFECT OF WATER INJECTION AND OFF SCHEDULING OF VARIABLE INLET GUIDE VANES, GAS GENERATOR SPEED AND POWER TURBINE NOZZLE ANGLE ON THE PERFORMANCE OF AN AUTOMOTIVE GAS TURBINE ENGINE
Edward L. Warren Mar. 1980 35 p
(Contract EC-77-A-31-1040)
(NASA-TM-81415; E-333; DOE/NASA/1040-80/10) Avail: NTIS HC A03/MF A01 CSCL 21E

The Chrysler/ERDA baseline automotive gas turbine engine was used to experimentally determine the power augmentation and emissions reductions achieved by the effect of variable compressor and power engine geometry, water injection downstream of the compressor, and increases in gas generator speed. Results were dependent on the mode of variable geometry utilization. Over 20 percent increase in power was accompanied by over 5 percent reduction in SFC. A fuel economy improvement of at least 6 percent was estimated for a vehicle with a 75 kW (100 hp) engine which could be augmented to 89 kW (120 hp) relative to an 89 Kw (120 hp) unaugmented engine. ALTERNATIVES FOR JET ENGINE CONTROL Semiannual Status Report, 1 Sep. 1979 - 29 Feb. 1980
Michael K. Sain 1980 93 p refs
(Grant NsG-3048)
(NASA-CR-162911) Avail: NTIS HC A05/MF A01 CSCL 21E

Nonlinear modeling researches involving the use of tensor analysis are presented. Progress was achieved by extending the studies to a controlled equation and by considering more complex situations. Included in the report are calculations illustrating the modeling methodology for cases in which variables take values in real spaces of dimension up to three, and in which the degree of tensor term retention is as high as three. JT9D-7A (SP) JET ENGINE PERFORMANCE DETERIORATION TRENDS
G. Paul Richter, W. J. Olsson, and N. B. Andersen 1980 24 p ref Presented at the Intern. Aircraft Maintenance Eng. Exhibition and Conf., Dallas, 8-10 Apr. 1980; sponsored by Hamilton Burr Publishing Co. · Prepared in cooperation with Pratt and Whitney Aircraft Group, East Hartford, Conn. and Pan American World Airways, Inc., Jamaica, N.Y.
(NASA-TM-81459; E-388) Avail: NTIS HC A02/MF A01 CSCL 21E

The levels, trends, and causes of engine performance deterioration were investigated. A series of installed engine calibrations (both on-the-ground and in-flight) were performed on two new Pan American World Airways 747 SP aircraft. The performance data gathered covered from before the first flight through approximately 1000 flight cycles and 6900 flight hours.

To accomplish the calibrations a special instrumentation system for ground testing of installed engines over a broad power range was used along with performing concurrent in-flight engine calibrations under revenue service conditions. Results of the analysis of the data, which provide a better understanding of short and long term performance deterioration of both engines and modules are presented. J.M.S.

OPTIMUM SUBSONIC, HIGH-ANGLE-OF-ATTACK NACELLES
Roger W. Luidens, Norbert O. Stockman, and James H. Diedrich [1979] 20 p refs Prepared for the 12th Congr. of the Intern. Council of the Aeron. Sci., Munich, 13-17 Oct. 1980 and the 1980 Aerospace Congr. and Exposition, Los Angeles, 13-16 Oct. 1980; sponsored by the Soc. of Automotive Engr.
(NASA-TM-81491; E-406) Avail: NTIS HC A02/MF A01 CSCL 21E

The optimum design of nacelles that operate over a wide range of aerodynamic conditions and their inlets is described. For low speed operation the optimum internal surface velocity distributions and skin friction distributions are described for three categories of inlets: those with BLC, and those with blow in door slots and retractable slats. At cruise speed the effect of factors that reduce the nacelle external surface area and the local skin friction is illustrated. These factors are cruise Mach number, inlet throat size, fan-face Mach number, and nacelle contour. The interrelation of these cruise speed factors with the design requirements for good low speed performance is discussed. J.M.S.

FEASIBILITY STUDY OF AN ISOLATED REVERSE-TURBINE SYSTEM FOR GAS TURBINE ENGINES
Thomas L. Bowen Dec. 1979 133 p refs
(SF43432301)
(AD-A077898; DTNSRDC-79/033) Avail: NTIS HC A07/MF A01 CSCL 21/5

Aircraft gas turbine engines, as now configured for ship propulsion, are unidirectional in output rotation and, therefore, require the added complexity of a reversing transmission or a reversible-pitch propeller. This study explores the feasibility of a novel reverse-turbine concept which is configured to adapt to existing free-power turbine engines without additional clutches or separate drive trains. This device, termed the 'isolated reverse turbine', is sized for meeting that most demanding maneuver for a fixed-pitch propeller-driven frigate or destroyer, namely, the crash reversal maneuver. The reverse-turbine concept would replace the function of the reversing gear or the reversible-pitch propeller; it could also complement electrically actuated reverse transmissions by eliminating the need for braking resistors and switches. Because of the potentially wide applicability of this reverse-turbine concept, it is recommended that additionally substantiating data be obtained to demonstrate the practicality of required hardware components. Full-scale development is not recommended at this time because the status of the above-mentioned alternatives has not been fully evaluated. GRA

A multi-task research program on aerodynamic problems in advanced axial-flow turbomachine configurations is being carried on at Iowa State University. The elements of this program are intended to contribute directly to the improvement of compressor, fan, and turbine design methods. Experimental efforts in intrapassage flow pattern measurement, unsteady blade row interaction, and control of secondary flow are included, along with computational work on inviscid-viscous interaction blade passage flow techniques. This first Annual Report summarizes progress to date and indicates the direction of each task for the immediate future. GRA

VELOCITY PROFILES IN A LONG INLET DUCT EMPLOYING A PHOTON CORRELATING LASER VELOCIMETER WITHOUT SEEDING M.S. Thesis
H. J. V. Rogers Dec. 1979 172 p refs
(AD-A079878; AFIT/GAE/AA/79D-16) Avail: NTIS HC A08/MF A01 CSCL 14/3

This thesis involves a practical application of the Malvern Laser Velocimeter System (LV). In this work, the LV was used to measure mean velocity profiles across the inside diameter of a duct which supplies air to the compressor of a jet engine. The engine, which is a General Electric J-85 turbo-jet engine is located in the Propulsion Laboratories of Wright-Patterson Air Force Base in Ohio. In addition to the mean velocity profiles, the LV was used to measure turbulence intensity profiles across the inside diameter of the duct at each of the three test points. To analyze the quality of the LV data as obtained, alternate mean velocity profiles and turbulence intensity profiles were obtained with the aid of a Hot Wire Anemometer System and a Pitot-Static Tube. During each of the traverses, or tests, with the LV System, the Hot Wire System and the Pitot-Static Tube, the engine was held at a fixed RPM, being 50% or 70% of maximum engine RPM. Good correlation was achieved between each of the three systems in respect to the mean velocity profiles obtained at each of the three test positions while the turbulence intensity profiles matched well in the regions of the flow where turbulence levels of 2% to 30% were encountered. GRA

AN EXPERIMENTAL STUDY OF STATIC THRUST AUGMENTATION USING A 2-D VARIABLE EJECTOR M.S. Thesis
Eli Kedem Dec. 1979 97 p refs
(AD-A079857; AFIT/GAE/AA/79D-7) Avail: NTIS HC A05/MF A01 CSCL 21/8

A short rectangular throat ejector was constructed and tested to determine the effects of a number of variables on thrust augmentation and mass augmentation. The variables included those associated with geometry (e.g., diffuser length/throat length, diffuser area ratio, diffuser sidewall angle, nozzle angles and positions) and those due to differences in primary mass flow rate distributions among the nozzles. There were two kinds of thrust augmentation that were calculated; the free thrust augmenting ratio and the isentropic thrust augmenting ratio. The free thrust augmenting ratio is the ratio of the ejector's measured thrust to the sum of the nozzles' measured thrust, if each of them were discharged separately to ambient pressure. The isentropic thrust augmenting ratio is the ratio of the ejector's measured thrust to the calculated thrust of the nozzles if discharged isentropically to the ambient pressure. A free thrust augmentating ratio as high as 1.63 and an isentropic thrust augmenting ratio of up to 1.29 were obtained. Mass augmentation which is the ratio of secondary flow to primary flow was in the range of 3.5 to 5. Some conclusions concerning design aspects were drawn also. They include the necessity of 3-D shrouding for the ejector's inlet and exit and the prevention of blowing high velocity air (primary and BLC flow) tangential to the ejector walls. GRA

WING/STORE FLUTTER WITH NONLINEAR PYLON STIFFNESS

Robert N. Desmarais and Wilmer H. Reed, III. Apr. 1980. 8 p. refs. Presented at the AIAA/ASME/ASCE/AHS 21st Structures, Struct. Dyn. and Mater. Conf., Seattle, 12-14 May 1980.
(NASA-TM-81789) Avail: NTIS. HC A02/MF A01. CSCL 01C.

Recent wind tunnel tests and analytical studies show that a store mounted on a pylon with soft pitch stiffness provides substantial increase in flutter speed of fighter aircraft and reduces dependency of flutter on mass and inertia of the store. This concept, termed the decoupler pylon, utilizes a low frequency control system to maintain pitch alignment of the store during maneuvers and changing flight conditions. Under rapidly changing transient loads, however, the alignment control system may allow the store to momentarily bottom against a relatively stiff backup structure in which case the pylon stiffness acts as a hardening nonlinear spring. Such structural nonlinearities are known to affect not only the flutter speed but also the basic behavior of the instability. The influence of pylon stiffness nonlinearities or the flutter characteristics of wing mounted external stores is examined. J.M.S.

ADAPTIVE ESTIMATION OF INFORMATION VALUES IN CONTINUOUS DECISION MAKING AND CONTROL OF ADVANCED AIRCRAFT. Final Report.
Randall Steeb, Yee-Yeen Chu, Cynthia Clark, Yo Ram Alperovitch, and Amos Freedy. Jun. 1979. 127 p. refs.
(Contract F44620-76-C-0094; AF Proj. 2313)
(AD-A077917; PATR-1037-79-6; AFOSR-79-1266TR) Avail: NTIS. HC A07/MF A01. CSCL 05/10.

This report describes research and development centered on evaluation of information needs in advanced operations. The selection of information for display is a recurrent, subjective decision involving many factors--aircraft state, environmental conditions, operator capabilities, and acquisition costs, among others. An adaptive computer model has been developed which incorporates these factors into a multi-attribute decision model. The program is designed to capture the operator's information seeking policy using a training algorithm based on pattern recognition techniques. The individual policy is then used for information system evaluation and for automated information management. Experimental tests of the adaptive modeling and information management approaches were made using a task simulation resembling multiple intercept operations in advanced aircraft. Individual subjects (8 in study) navigated a simulated aircraft through a hazardous, changing environment. The report includes an example application of the information management program to F-14 threat intercept operations and a set of system application guidelines. GRA

DEVELOPMENT OF STABILITY METHODS FOR APPLICATIONS TO NONLINEAR AEROELASTIC OPTIMIZATION. Final Report, Jan. 1978 - Jun. 1979.
R. F. Taylor. Jul. 1979. 189 p. refs.
(Grant AF-AFOSR-3487-78; AF Proj. 2307)
(AD-A077851; UDR-TR-79-64; AFFDL-TR-79-3114) Avail: NTIS. HC A09/MF A01. CSCL 20/4.

An approximate procedure is developed which determines efficiently and accurately the amplitude-dependent stability of nonlinear systems. This new procedure, which is referred to as the 'method of imposed disturbances', is shown to be especially applicable to studies of the sensitivity of nonlinear aeroelastic systems to changes in design variables. Emphasis is placed on airfoil and panel flutter instabilities in aerodynamically nonlinear flow. To develop the theory, modified forms of the van der Pol oscillator equation and of the Lewis servomechanism equation are studied. Based on the principle of conservation of energy in a limit cycle, approximate closed-form expressions are developed which relate the loading and the limit amplitude to system design variables. Results are compared to solutions obtained by numerical integration. GRA

AIRCRAFT MOTION SENSITIVITY TO DYNAMIC STABILITY DERIVATIVES. Final Report, 1 Oct. 1977 - 30 Sep. 1978.
T. F. Langham. AEDC. Jan. 1980. 142 p. refs.
(AF Proj. 921E)
(AD-A079421; AEDC-TR-79-11) Avail: NTIS. HC A07/MF A01. CSCL 20/4.

A six degree-of-freedom, nonlinear dynamic derivative sensitivity study has been conducted on a fighter/bomber and an attack-type aircraft. The dynamic derivatives investigated in the study were C sub lq, C sub mq, C sub mp, C sub mr, C sub l beta, and C sub n beta. For the cross-coupling derivatives, C sub lq was shown to have the most significant effect on the level and 3-g turning flight motion, followed by C sub nq and C sub mp with the derivative C sub mr showing little to negligible effect in the same regime. For the acceleration derivatives, C sub l beta was shown to have a significant influence on the aircraft motion. The C sub n beta derivative had little effect on the simulated motion. The analysis also documents the configuration dependency of the cross-coupling derivatives and investigates the effects of nonlinear variations in the derivatives on the aircraft motion. GRA

SCALE MODEL STUDIES FOR ESTABLISHING THE FLOW PATTERNS OF A LOW-SPEED TUNNEL. Progress Report, 15 Mar. - 14 Sep. 1979.
P. S. Barna. Hampton, Va.: NASA, Langley Res. Center. Mar. 1980. 73 p. refs.
(Grant NsG-1563)
(NASA-CR-159234) Avail: NTIS. HC A04/MF A01. CSCL 14B.

Experiments were conducted in a model tunnel scaled down in a ratio of 1:24 from the full size prototype V/STOL tunnel at NASA Langley Research Center. The flow characteristics around the tunnel were studied and the location and causes of local flow separation and local recirculation were documented. The study of the interaction between the various components from which the tunnel is built, an experimental setup similar to the sequence of tunnel circuit components was constructed which enabled the various components to be tested either individually or in combination. The components were tested by the simple technique of blowing air through them, then measuring the velocity distribution at relevant sections. A.R.H.

AEROSOL FILTER LOADING DATA FOR A SIMULATED JET ENGINE TEST CELL AEROSOL Final Report, Jan. - Jul. 1979
Dale A. Lundgren Tyndall AFB, Fla. Air Force Engineering and Services Center Aug. 1979 44 p
(Contract F08637-79-M-0784; AF Proj. 1900)
(AD-A078779; ESL-TR-79-28) Avail: NTIS HC A03/MF A01 CSCL 21/5

The Air Force routinely tests turbine engines in fixed test cells, some of which have been cited by state pollution control officials for violations of opacity regulations. A previous theoretical study, CEEDO-TR-78-53, predicted that relatively low efficiency and low cost techniques could bring jet engine test cells into compliance with air pollution regulations. The system proposed included a water cooling spray and a mist eliminator followed by a medium efficiency, high velocity, throw-away type glass filter media. The most serious limitation of velocity filtration is the aerosol mass loading and the potential for rapid pressure drop build up across the filter. Since filter loading characteristics could not be theoretically predicted, the objective of this follow-on work was to experimentally test and report the filter loading characteristics of glass fiber filters for possible application to jet engine test cell exhaust plume opacity control. Two types of glass fiber media were tested: (1) two different medium efficiency pre-filter media; and (2) two different high efficiency final filter media. GRA

ORBITAL ESTIMATION USING TWO-BODY CLASSICAL ORBITAL ELEMENTS AS MEASUREMENT UPDATES M.S. Thesis
Daryl G. Boden Dec. 1979 122 p refs
(AD-A079903; AFIT/GA/AA/79D-3) Avail: NTIS HC A06/MF A01 CSCL 22/3

Currently, the Space Defense Center (SDC) uses the position and velocity data of a satellite track to update the orbital elements of the satellite. An alternate approach would be to process the radar data at the tracking site and transmit two-body orbital elements to SDC as measurement updates. This would significantly reduce the data load at SDC. The truth model used in this study to evaluate performance and provide measurement updates to the filters includes the first four zonal harmonics and the first sectoral harmonic of the geopotential and the air drag. The estimator models include two-body dynamics and J sub 2 perturbations. In addition, the derivative of the semi-major axis is used to estimate the effects due to air drag. Perfect dynamics with measurement noise are assumed for the filter models. Three filters are evaluated: Least Squares, Bayes, and Kalman. The performance of the three filters is similar. The Bayes and Kalman Filters are nearly the same and indistinguishable in this study. All three filters performed adequately with the following exceptions. The filters diverge when singularities are present in the classical orbital elements. All three filters underestimate the covariance of the estimates. Finally, the filters track noise in the estimate of the derivative of the semi-major axis, degrading the prediction capabilities of the filters. GRA

USE OF AN AERODYNAMIC TURN TO MAXIMIZE THE ORBIT INCLINATION CHANGE FOR THE SPACE SHUTTLE ORBITER M.S. Thesis
Glenn S. Geary Dec. 1979 82 p refs
(AD-A079855; AFIT/GA/AA/79D-4) Avail: NTIS HC A05/MF A01 CSCL 22/1

Previous studies have shown that the space shuttle orbiter can achieve larger orbit inclination changes using an aerodynamic turn than can be obtained using a rocket motor burn. This analysis determines the angle of attack and bank angle histories which maximize the change in inclination angle while satisfying final altitude and velocity loss constraints. The angle of attack and bank angle are modelled as polynomial functions of time with unknown coefficients. The optimum values of the coefficients are determined by a gradient optimization technique. Additionally, the sensitivity of the change in inclination angle to changes in the orbit apogee altitude is examined. It is shown that the space shuttle orbiter can obtain higher inclination angle changes with higher apogee altitudes. GRA

STABILIZING AN UNSTABLE ORBIT ABOUT L3 IN THE SUN, EARTH, MOON SYSTEM USING LINEAR CONSTANT GAIN FEEDBACK M.S. Thesis
Doyne E. Smith Dec. 1979 80 p refs
(AD-A079860; AFIT/GA/AA/79D-10) Avail: NTIS HC A05/MF A01 CSCL 22/3

Equations of motion for a satellite in a planar elliptic four-body system are used to generate an orbit about L3. Initial conditions and a periodic reference orbit were found using a circular four-body model. Linear constant gain feedback is used to stabilize the orbit about L3 in the planar, elliptic four-body model. The computed L3 orbit is plotted against the reference orbit to assess the effectiveness of position, velocity and position/velocity feedback compensation systems. Also computed is the integrated control gain costs for each type of feedback system used. Long term

stable motion near libration point L3 was achieved using position/velocity feedback compensation. Position and velocity feedback when used separately were ineffective as stabilizing feedback compensation systems. The integrated control gain costs also indicate that linear constant gain feedback is not an economical method to stabilize this periodic orbit about L3.GRA

APPLICATION AND COMPARISON OF STABLE PERIODIC ORBITS IN THE VICINITY OF LAGRANGIAN POINTS L4 AND L5 TO A FOUR-BODY TRUTH MODEL M.S. Thesis
William D. Beekman Dec. 1979 126 p refs
(AD-A079683; AFIT/GA/AA/79D-2) Avail: NTIS HC A07/MF A01 CSCL 22/3

All previously discovered stable periodic orbits about the triangular libration points are tested on a planar restricted four-body truth model. The truth model is an algorithm developed from equations used by T. A. Heppenheimer for colony location used perturbation theory and the equation of the center. Only one of the orbits, developed by Wheeler using a very restricted four-body problem with Sun - Moon - Earth circular motion, is found to be relatively stable for at least twenty years. It is prograde about L4 having a period in resonance with the lunar synodic month. Two other orbits, one similar to Wheeler's and one 180 degrees out of phase found by Kolenkiewicz and Carpenter are marginally stable. GRA

NAVPAC: A SPACE-QUALIFIED NAVIGATION PACKAGE
D. L. Zitterkopf Feb. 1979 150 p
(Contract N00017-72-C-4401)
(AD-A077062; APL/JHU-TG-1317) Avail: NTIS HC A07/MF A01 CSCL 22/3

NAVPAC (Navigation Package) is a space-qualified receiver instrument designed and developed by APL for the Defense Mapping Agency. The use of NAVPAC represents the first application of the Navy Navigation Satellite System to reconstruct accurately the orbit of another space vehicle. It also represents the first system for automatically providing a precise time-annotation capability for an event that occurs on a spacecraft. NAVPAC contains three dual-channel receivers to acquire and track signals automatically from as many as three Navy Navigation Satellites that are in view simultaneously. To help meet the program goals, NAVPAC also includes a three-axis miniature electrostatic accelerometer. The goals of NAVPAC include accurately reconstructing a host-vehicle orbit, providing atmospheric density information, and improving the gravity field model. GRA

DETERMINATION OF THE MINIMUM DELTA 5 TRANSFER TRAJECTORY FROM A LOW EARTH ORBIT TO A STABLE ORBIT AROUND THE LAGRANGIAN POINT L4 IN A RESTRICTED FOUR-BODY SYSTEM M.S. Thesis
Theron E. Weimer Dec. 1979 114 p refs
(AD-A079881) Avail: NTIS HC A06/MF A01 CSCL 22/3

In this report, the equations of motion for a satellite in restricted four-body motion are derived and examined. An algorithm is developed that produces a minimum delta 5 transfer trajectory from a low Earth orbit to establishment in Wheeler's stable periodic orbit around L4. Both a Hohmann transfer and an infinite velocity, straight-line transfer are examined as initial conditions for integration of the equations of motion. Transfer trajectories are determined to ten points around Wheeler's orbit so that a minimum delta 5 trajectory can be determined. Two types of minimum delta 5 values were found. One type is a true minimum value, the other type is a limiting value beyond which the target orbit cannot be reached. Results are presented on a transfer trajectory that gives a minimum delta 5 from the points examined. From these results a more accurate transfer location is estimated. GRA

SPACECRAFT TEST CHAMBER CONTAMINATION STUDY IN THE AEDC MARK 1 FACILITY Final Report, Apr.-Jul. 1977
J. G. Pipes, D. F. Frazine, R. P. Young, E. N. Borson, and L. H. Rachal AEDC, Arnold AFS, Tenn. Jan. 1980 26 p refs
(AD-A079638; AEDC-TR-79-41) Avail: NTIS HC A03/MF A01 CSCL 14/2

Recent results of a contamination study in the Arnold Engineering Development Center Mark 1 space simulation chamber are presented. The measurements were associated with the Global Positioning System satellite test conducted in the Mark 1 facility between April 6, 1977, and July 24, 1977. Multiple internal reflection spectroscopy (MIRS) internal reflection elements (IRE's), thermal control surface witness plates, and quartz crystal microbalances (QCM's) were used to measure contaminants condensible during an extended chamber evacuation. An automatic particle counter was used to measure airborne particle density when the chamber was at atmospheric pressure. The nonvolatile residue wipe technique was employed to determine the general cleanliness of the chamber hardware. Temperature of the IRE's during chamber operation was between 150 and 200 K. One QCM was temperature controlled to a temperature of 238 K, the other QCM operated at 135 K. After chamber repressurization, the IRE's were scanned in the 2- to 15- micrometer wavelength region. Resulting spectra indicated a coating of diffusion pump fluid (DC704) at a concentration level just above the limit of detectability. GRA

This report describes a technique for determining the stability and dynamic characteristics of a digital control system in terms of several selected system parameters. The method requires that the system characteristic equation be available in the complex p-domain. An example is provided to further elucidate the technique. It is the capability that makes the method more powerful than most design techniques (which describe stability in terms of only one variable parameter or gain). GRA

A number of sources of error degrade the tracking performance of practical millimeter radars. These include receiver noise, target noise, multipath, clutter, servo noise and propagation effects. In this technical note, these error sources are considered, and the available techniques for minimizing their influence are reviewed. A detailed analysis of a typical millimeter radar tracking a military target has been performed in order to evaluate the relative importance of the different sources of tracking error. Both frequency agile and fixed frequency operation are considered. GRA

HC A02/MF A01 CSCL 17/7

The Doppler principle has been used to track satellites since the early 1960's. When the data sampling interval was less than one second, this data has been treated as frequency data in orbit determination programs. This method results in an approximation when the number of cycles counted in an interval divided by the time interval is treated as a frequency in the equations of condition. The result of this truncated series is that it produces station heights that are about 1.4 meters too low. Therefore the data must be treated as range differences, even for sampling intervals as low as 1 second. GRA

A computer program called AFSIM has been developed to conduct numerical simulations of plasma interactions with a satellite, assuming the satellite to be represented by an infinitely long cylinder and treating the plasma as discrete particles. The system is assumed to be uniform along the axis of the satellite. A number of features of the actual satellite are incorporated into the model with as much flexibility as possible to accommodate a wide range of conditions. GRA

STRUCTURAL TESTS ON A TILE/STRAIN ISOLATION PAD THERMAL PROTECTION SYSTEM
Jerry G. Williams Mar. 1980 46 p
(NASA-TM-80226) Avail: NTIS HC A03/MF A01 CSCL 22B

The aluminum skin of the space shuttle is covered by a thermal protection system (TPS) consisting of a low density ceramic tile bonded to a matted-felt material called strain insulation pad (SIP). The structural characteristics of the TPS were studied experimentally under selected extreme load conditions. Three basic types of loads were imposed: tension, eccentrically applied tension, and combined in-plane force and transverse pressure. For some tests, transverse pressure was applied rapidly to simulate a transient shock wave passing over the tile. The failure mode for all specimens involved separation of the tile from the SIP at the silicone rubber bond interface. An eccentrically applied tension load caused the tile to separate from the SIP at loads lower than experienced at failure for pure tension loading. Moderate in-plane as well as shock loading did not cause a measurable reduction in the TPS ultimate failure strength. A strong coupling, however, was exhibited between in-plane and transverse loads and displacements. Author

MINICOMPUTER CONTROLLED SYSTEM FOR TESTING TELEMETRY RECEIVING AND RECORDING SYSTEMS
E. L. Law and G. J. Harbold, Jr. 10 Oct. 1979 53 p
(AD-A078803; PMTC-TP-79-30) Avail: NTIS HC A04/MF A01 CSCL 19/6

This report describes a minicomputer controlled system for testing telemetry receiving and recording stations and presents sample test results. Details of the interface between the minicomputer and the test equipment are also presented. The system can test a telemetry receiving and recording station in about one/fifth the time it takes to manually test the station. The test results are printed out and can be stored on the computer for trend analysis and other statistical analyses. The system accuracy is + or - 1.0 dB or better for all tests. The results of the various tests correlate well with each other and with manually performed tests. It has been demonstrated that a minicomputer controlled system can perform a good, fast, accurate test on a telemetry receiving and recording station. GRA

LIGHTWEIGHT FUEL CELL POWERPLANT COMPONENTS PROGRAM Final Report, 18 Mar. 1974 - 31 Dec. 1979
R. E. Martin 22 Feb. 1980 103 p refs
(Contract NAS8-30637)
(NASA-CR-161412; FCR-1656) Avail: NTIS HC A06/MF A01 CSCL 10B

A lightweight hydrogen-oxygen alkaline fuel cell incorporated into the design of a lightweight fuel cell powerplant (LFCP) was analytically and experimentally developed. The powerplant operates with passive water removal which contributes to a lower system weight and extended operating life. A preliminary LFCP specification and design table were developed along with a lightweight power section for the LFCP design, consisting of repeating two-cell modules was designed. Two, four-cell modules were designed incorporating 0.508 sq ft active area space shuttle technology fuel cells. Over 1,200 hours of single-cell and over 8,800 hours of two-cell module testing was completed. The 0.25 sq ft active area lightweight cell design was shown to be capable of operating on propellant purity reactants out to a current density of 600ASF. Endurance testing of the two-cell module configuration exceeded the 2,500-hour LFCP voltage requirements out to 3700-hours. A two-cell module capable of operating at increased reactant pressure completed 1000 hours of operation at a 30 psia reactant pressure. A lightweight power section consisting of fifteen, two-cell modules connected electrically in series was fabricated. J.M.S.

IMPACT FUSION WITH A SEGMENTED RAIL GUN
R. A. Muller, R. L. Garwin, and B. Richter Dec. 1979 16 p refs

(Contract EY-76-C-03-0115)
(AD-A079811; SRI-JSN-79-05) Avail: NTIS HC A02/MF A01 CSCL 21/3

The rail gun offers an attractive alternative to the traveling wave rifle for the magnetic acceleration of macroscopic (0.05 g) bullets for impact fusion. In this paper we review the basic rail gun equations and indicate how energy efficiency can be designed into it. We set as our preliminary goal the delivery of 1 megajoule in 10 nanoseconds, with a specific energy of 20 MJ/g (i.e. a bullet mass of 0.05 g); these values are taken from the requirements being considered for heavy-ion fusion. Using these numbers the final particle velocity is 200 km/sec. For a delivery time of 10 nanoseconds, this velocity implies that the projectile length is about 2 mm. Impact fusion is feasible because of the coincidence that a bullet with all dimensions, roughly 2 mm has the required mass. GRA

SOLAR ROCKET SYSTEM CONCEPT ANALYSIS Final Report, 19 Feb. - 30 Sep. 1979
Fred G. Etheridge Dec. 1979 233 p refs
(Contract F04611-79-C-0007; AF Proj. 5730)
(AD-A079117; SSD-79-175; AFRPL-TR-79-79) Avail: NTIS HC A11/MF A01 CSCL 21/8

The objective of the solar rocket concept analysis was to determine the potential value of solar-thermal rockets in large delta velocity space missions. A specific impulse of 872 seconds was achieved by passing hydrogen through a heat exchanger placed at the focal spot of a large parabolic dish solar concentrator mirror. With a windowed chamber type of thruster and a particle-laden hydrogen flow the specific impulse was 1041 seconds. Inflatable construction techniques were determined to be optimum for the large concentrating mirrors based on ease of deployment and low specific mass. It was concluded that the solar rocket offers the mission planner a viable option between the high payload-long trip time of the mercury ion bombardment system and the lower payload-short trip time of a LO2-LH2 stage. GRA

23 CHEMISTRY AND MATERIALS (GENERAL)

INVESTIGATION OF ELONGATION OF BORON FILAMENT DURING FABRICATION AND ANNEALING Ph.D. Thesis
Jimmy Wayne Eason 1979 159 p
Avail: Univ. Microfilms Order No. 8004675

Elongation in boron filament during fabrication was investigated and found to be as great as 16 percent under certain conditions. It was also found to obey a relatively simple empirical relationship which yielded effective activation energies. A model for the elongation was proposed, and a computer program was designed to simulate the deposition and elongation of boron on a tungsten wire substrate. Internal residual stress distribution of boron/tungsten filament were also generated by the computer program. Good agreement was found between the proposed model and experimental results. Negative elongation (contraction) of boron filament was observed during annealing and found to be dependent upon the concentration of oxygen present in the annealing atmosphere. The contraction was also found to be the result of void formation at the core-born sheath interface. Dissert. Abstr.

AN ASSESSMENT OF THE RISKS PRESENTED BY CARBON FIBER COMPOSITES RELEASED FROM MOTOR VEHICLE FIRES
Donald B. Rosenfield, Joseph Fiksel, and Ashok Kalelkar Hampton, Va. NASA Langley Research Center Mar. 1980 87 p refs Sponsored in part by DOT
(Contract NAS1-15380)
(NASA-CR-159207; DOT-TSC-RSPA-80-4) Avail: NTIS HC A05/MF A01 CSCL 11D

A risk assessment was conducted to estimate the potential losses through 1993 due to the usage of carbon fiber (CF) composites in U.S. motor vehicles, including automobiles and trucks. A methodology was developed to compute estimated dollar losses by county and equipment type, using a Poisson model for the incidence of equipment failures. This approach incorporated data on the geographic distribution of potentially vulnerable facilities, as well as the mean CF exposure levels at which various equipment would fail. The results were then statistically aggregated to produce a national risk profile for estimated annual losses in 1993. The expected loss was $5,567 per year (1977 dollars), and the likelihood of exceeding $500,000 in annual losses was estimated to be at most one in ten thousand. The sensitivity of these results to major input parameters was investigated, and it was found that under extreme worst-case assumptions the annual loss would increase to about $1.5 million. J.M.S.

HIGH ELECTRICAL RESISTIVITY CARBON/GRAPHITE FIBERS Final Report
F. Lincoln Vogel and William C. Forsman 17 Apr. 1980 26 p refs
(Grant NsG-1596)
(NASA-CR-162909) Avail: NTIS HC A03/MF A01 CSCL 11D

Carbon/graphite fibers were chemically oxidized in the liquid phase to fibers of graphite oxide. Resistivity increases as high as 10,000 times were obtained, the oxidized fiber decomposed on exposure to atmosphere. A factor of 1,000 remained as a stable increment. The largest change observed was 1,000,000 times. Best results were obtained on the most highly graphitized fibers. Electrochemical oxidation yielded a lower increase--about 10 times, but provided a controllable method of synthesis and insight to the mechanism of reaction. Tensile tests indicated that the strength of the fiber on oxidation was decreased by no more than 25 percent. Author

DYNAMIC MODULUS AND DAMPING OF BORON, SILICON CARBIDE, AND ALUMINA FIBERS
J. A. DiCarlo and W. Williams [1980] 44 p refs Presented at the 4th Ann. Conf. on Composites and Advanced Mater., Cocoa Beach, Fla. 20-24 Jan. 1980 sponsored by the Am. Ceram. Soc.

(NASA-TM-81422; E-345) Avail: NTIS HC A03/MF A01 CSCL 11D

The dynamic modulus and damping capacity for boron, silicon carbide, and silicon carbide coated boron fibers were measured from -190 to 800 C. The single fiber vibration test also allowed measurement of transverse thermal conductivity for the silicon carbide fibers. Temperature dependent damping capacity data for alumina fibers were calculated from axial damping results for alumina-aluminum composites. The dynamics fiber data indicate essentially elastic behavior for both the silicon carbide and alumina fibers. In contrast, the boron based fibers are strongly anelastic, displaying frequency dependent moduli and very high microstructural damping. The single fiber damping results were compared with composite damping data in order to investigate the practical and basic effects of employing the four fiber types as reinforcement for aluminum and titanium matrices. K.L.

N80-20314*# National Aeronautics and Space Administration, Lewis Research Center, Cleveland, Ohio.
CALCULATION OF RESIDUAL PRINCIPAL STRESSES IN CVD BORON ON CARBON FILAMENTS
Donald R. Behrendt. [1980] 15 p. refs. Prepared for the 4th Ann. Conf. on Composites and Advanced Mater., Cocoa Beach, Fla., 21-24 Jan. 1980; sponsored by the Am. Ceram. Soc.
(NASA-TM-81456; E-386) Avail: NTIS HC A02/MF A01 CSCL 11D

A three-dimensional finite element model of the chemical vapor deposition of boron on a carbon substrate (B/C) is developed. The model includes an expansion of the boron after deposition due to atomic rearrangement and includes creep of the boron and carbon. Curves are presented showing the variation of the principal residual stresses and the filament elongation with the parameters defining deposition strain and creep. The calculated results are compared with experimental axial residual stress and elongation measurements made on B/C filaments. For good agreement between calculated and experimental results, the deposited boron must continue to expand after deposition, and the build up of residual stresses must be limited by significant boron and carbon creep rates. K.L.

DEVELOPMENT OF LaRC 180/NR150B2 POLYIMIDE GRAPHITE HYBRID COMPOSITES
Milan G. Maximovich, O. Bergren, and S. Lockerby. Mar. 1980 61 p. refs.
(Contract NAS1-15433)
(NASA-CR-159196) Avail: NTIS HC A04/MF A01 CSCL 11D

A method for co-curing NR150B2 and LaRC 180 prepregs into hybrid composites was developed. The processing characteristics and the properties of the hybrid composites were compared with those of laminates fabricated from the individual component prepregs. Resin forms were selected and optimized and a new NR150 formulation was investigated. The new formulation greatly facilitated the processing and the performance of this system. Quality control techniques were evaluated and developed; high quality laminates were fabricated from both individual resin systems, and hybrid laminates were successfully co-cured. Optimum hybrid forms were investigated and several novel approaches were explored. An optimum hybrid system was developed that utilizes a LaRC curing schedule but shows no degradation of mechanical properties after aging 500 hr in air at 260 C. J.M.S.

THE VULNERABILITY OF COMMERCIAL AIRCRAFT AVIONICS TO CARBON FIBERS
Jerome A. Meyers and Seymour Salmirs. Hampton, Va.: NASA, Langley Res. Center. Apr. 1980. 50 p. refs.
(Contract NAS1-15238)
(NASA-CR-159213) Avail: NTIS HC A03/MF A01 CSCL 11D

Avionics components commonly used in commercial aircraft were tested for vulnerability to failure when operated in an environment with a high density of graphite fibers. The components were subjected to a series of exposures to graphite fibers of different lengths. Lengths used for the tests were (in order) 1 mm, 3 mm, and 10 mm. The test procedure included subjecting the equipment to characteristic noise and shock environments. Most of the equipment was invulnerable or did not fail until extremely high average exposures were reached. The single exception was an air traffic control transponder produced in the early 1960's. It had the largest case open area through which fibers could enter and it had no coated boards. K.L.

PREDICTION AND VERIFICATION OF MOISTURE EFFECTS ON CARBON FIBER-EPOXY COMPOSITES. Progress Report, Oct. 1977 - Oct. 1978
Joseph M. Augl. 30 Mar. 1979. 47 p. refs.
(AD-A079557; NSWC/TR-79-43) Avail: NTIS HC A03/MF A01 CSCL 11/4

Moisture has an effect on the elastic as well as on the strength properties of composites. In this work we have experimentally verified the prediction of changes in the longitudinal shear modules G sub 12 as a function of moisture uptake and temperature. The properties of the bulk resin (measured independently as a function of temperature and moisture concentration) were used for predicting the composite response by using the simple Halpin-Tsai equation of micromechanics.

The excellent agreement between the predicted and observed values demonstrates the feasibility of predicting changes in (reversible properties) of composite in a natural service environment as suggested in a previous report. This predictive scheme considered simultaneously the concepts of diffusion, environmental modeling, micromechanics, and a finite difference laminate theory. GRA

This report documents the results of a study to evaluate the potential of eutectic composite materials for use in electronic, optical and other devices. The composite materials may be a combination of metal-metal, metal-semiconductor, semiconductor-semiconductor, semiconductor-insulator, or insulator-insulator classes of materials. Device concepts, based on eutectic composites, were given preliminary technical and economic evaluation; brief descriptions of promising devices are listed. Eutectic-based cold cathode and display devices were evaluated by experiments to determine the performance of a prototype cathode device and to determine the design requirements for fabrication of a diode-type display. (SAND-79-0176; CONF-791116-3) Avail: NTIS HC A02/MF A01

A suitable geometry for measuring the transverse compressive properties of Kevlar 49 cloth/epoxy composites was defined. Two geometries and strain measuring methods were evaluated: straight-sided cylinders with strain calculated from total platen displacement (includes specimen end effects), and reduced-section cylinders with strain measured in the reduced gage region (no end effects). The straight-sided specimens had length to diameter ratios between 1.1 and 2.7 and were tested with their ends both dry and lubricated. At stress levels below failure, the stress-strain curves from the reduced-section samples were in good agreement with the straight-sided specimen data. Curves from both geometries lie within the same scatter band. Strength data from the reduced-section specimen were inconclusive. Based on this study, straight-sided cylinders with aspect ratios between 2.25 and 2.50 were selected as suitable specimens for characterizing the transverse compressive properties of thick Kevlar cloth/epoxy laminates. LOW TEMPERATURE THERMAL CONDUCTIVITIES OF GLASSY CARBONS
A. C. Anderson 1979 9 p refs Presented at the 16th Intern. Thermal Conductivity Conf., Chicago, 7 Nov. 1979
(Contract EY-76-C-02-1198)
(COO-1198-1280; CONF-791134-3) Avail: NTIS HC A02/MF A01

The thermal conductivity of glassy carbon in the temperature range 0.1 to 100 K appears to depend only on the temperature at which the material was pyrolyzed. The thermal conductivity was related to the microscopic structure of glassy carbon. The reticulated structure was especially useful for thermal isolation at cryogenic temperatures. DOE

DAMPING OF ANISOTROPIC COMPOSITES STUDIED FROM THE PROPERTIES OF THE ROLLED COMPONENTS [VERFAHREN ZUR BESTIMMUNG DES DAEMPFUNGSVERHALTENS ANISOTROPER VERBUNDBAUTEILE AUS DEN EIGENSCHAFTEN DER LAMINATKOMPONENTEN]
Klaus Kehl 1978 137 p refs In GERMAN
(ILR-41; ISBN-3-79830-660-5) Avail: NTIS HC A07/MF A01

The rigidity and damping properties of the glass and carbon fiber reinforced plastics (GFK and KFK), were studied as well as applications to determining the frequencies and damping in the rolled product. Coefficients of rigidity for surface planes of disk and plates in the case of linear tension and torsion were calculated. Dynamic behavior, including unidirectional and multidirectional loads for composite materials was analyzed. The influence of temperature, frequency of vibration, and fiber orientation on the behavior of the reinforced plastics, and their applications were determined. The manufacture of membranes, tanks, tubes, and pipes was demonstrated. Author (ESA)

ON FLAME SPREAD MECHANISM OVER COMBUSTIBLE SOLID SURFACE
K. Akita Nov. 1979 6 p refs Transl. into ENGLISH from Tokyo Daigaku Kogakubu Kiyo A (Japan), v. 15, 1977 p 70-71
(BLL-RTS-12027) Avail: British Library Lending Div., Boston Spa, Engl.

The mechanism of flame propagation over combustible solid surfaces and its connection to the question of unequal combustion over thick and thin objects was examined. The effects of the size and shape, the flame temperature and direction, the composition of the surrounding atmosphere, and the external air

flow velocity on the flame propagation mechanism were investigated. The size of thickness of the object was emphasized. The results of experiments measuring the rate of flame propagation vertically downwards and horizontally over flat surfaces of poly methyl methacrylate are discussed. A.W.H.

THERMAL CONDUCTIVITY OF LIQUID CARBOXYLIC ACIDS
1979 9 p
(ESDU-79029; ISBN-0-85679-277-2) Copyright. For information on availability of series, sub-series, and other individual data items, write NTIS, Attn: ESDU, Springfield, Va. 22161. HC $194.50

Values of thermal conductivity at saturation pressure are presented in tabular form for the liquid aliphatic carboxylic acids which are members of the following groups: n-alkanoic acids, isoalkanoic acids, and unsaturated alkanoic acids. The data on which these recommended values of thermal conductivity are based are the most reliable available and the range covered is from the melting point to approximately 0.9 of the critical temperature. The procedure used to obtain the values of thermal conductivity is presented and indicates the effect of pressure. A typical application is in the heat transfer calculations in chemical process plant design. ESDU

VAPOUR PRESSURES AND CRITICAL POINTS OF LIQUIDS. 14: ALIPHATIC OXYGEN-NITROGEN COMPOUNDS
1979 27 p
(ESDU-79030; ISBN-0-85679-278-0) For information on availability of series, sub-series and other individual data items, write NTIS, Attn: ESDU, Springfield, Va. 22161. HC $674.50

Saturated vapor pressures of organic oxygen-nitrogen compounds such as amines, amides, nitro compounds, and alcohols are presented along with the procedures used to derive the vapor pressure values. The data on which the values in the Tables are based are the most reliabile available and have been fitted and correlated by equations that are valid from the melting temperature (or triple point where it is known) upwards over the whole liquid range. Tabular values derived from these equations vary from just under 0.01 mmHg to the critical pressure, thus considerably extending the range of values obtainable from Antoine equations available for some of the compounds. This data is useful for the design of process plants such as compressors, distillation columns, heat exchangers, liquefaction plants, and reactors. ESDU

ASYMPTOTIC ANALYSIS OF NEAR-STOICHIOMETRIC FLAME PROPAGATION Ph.D. Thesis
Asok Kumar Sen 1979 129 p
Avail: Univ. Microfilms Order No. 8003985

A two reactant model, with general Lewis numbers K and L for oxidant and fuel respectively, was analyzed. It was found that the phenomenon occurs (in the absence of dissociation) whenever K is large enough and L is small enough, the precise conditions always being met in practice. In other words, diffusion alone provides a satisfactory explanation. Dissociation of the combustion products is incorporated into the analysis to show that, while it does explain the shift in the maximum frame temperature, it has only a subsidiary effect on the maximum burning rate. Dissert. Abstr.

ROLE OF CLUSTER SIZE AND SURFACE ON PHASE TRANSITIONS Ph.D. Thesis
Pazhayannur Krishnan Swaminathan 1980 111 p
Avail: Univ. Microfilms Order No. 8006949

The effect of excluded volume is incorporated into a physical cluster model for the gas-liquid phase transition using the Percus-Yevick approximation for a mixture of spherical clusters to treat the excluded volume. The analytic properties of the model are examined using an expansion in terms of a variable containing the fugacity and the pressure. Scaled particle theory for a mixture of spherocylinders is used to examine the question of phase transition from pure size effect among rod like particles. It is shown that scaled particle theory does not predict such a phase transition. The phase transition behavior of the interacting Dimer model and three other lattice models with anisotropic interaction are examined by analyzing exact series expansions. The properties of the models are related to the nature of clusters the interaction schemes lead to. Dissert. Abstr.

THE DEVELOPMENT OF AN ELECTROCHEMICAL METHOD FOR THE DETERMINATION OF THE EFFECTIVE VOLUME OF CHARGED POLYMERS IN SOLUTION AND ITS APPLICATION TO CONTINUING STUDIES OF METAL ION BINDING POLYELECTROLYTES Ph.D. Thesis
Peter Slota, Jr. 1979 159 p
Avail: Univ. Microfilms Order No. 8005715

An electrochemical method that is projected for the determination of the effective volume of a colloidally dispersed polyelectrolyte phase in aqueous media was evaluated. Experiments with the highly flexible carboxy methyl dextran gel and the more rigidly cross linked poly methacrylic acid resin were performed. With the well defined gel (resin) phase it was possible to measure the polymer volume as a function of every experimental condition employed to test fully the fundamental concepts developed. Application of this method for estimate of the effective volume of a weakly acidic (basic) polymer in solution was attempted. Metal binding of Cu(2) with the repeating functional units of the soluble polyelectrolytes, poly methacrylic acid and poly glutamic acid, was investigated in two salt media, sodium sulfate and sodium poly styrene sulfonate. Potentiometric measurements were made to facilitate the resolution of species formed as well as their formation constants. Dissert. Abstr.

TWO-DIMENSIONAL, LAMINAR, MIXED (FORCED AND FREE) CONVECTION, RADIATIVE DIFFUSION FLAMES Ph.D. Thesis
Chun-Nan Liu 1979 195 p
Avail: Univ. Microfilms Order No. 8007097

The two dimensional, mixed mode (forced and free) convection, radiative and laminar diffusion flame over a vertical pyrolyzing fuel slab was investigated. Of particular interests were the variable distributions inside the boundary layer, the wall fluxes along the streamwise direction and the influence of eight parameters on the flame characteristics. Radiative heat transfer of absorbing emitting products, e.g., carbon dioxide, water vapor and soot, was assumed to be dominant only transversely and be negligible streamwisely. Based on this assumption, the boundary layer transport equations can be categorized as the parabolic type and thus were solved using a marching finite difference method. The radiation flux was formulated for the general nongray mixture of gases and soot. The exact and approximate formulas were obtained for numerical calculation. The pseudogray model was devised to reduce the computation time required by the nongray calculation. Dissert. Abstr.

METHOD AND MEANS FOR HELIUM/HYDROGEN RATIO MEASUREMENT BY ALPHA SCATTERING Patent
A. Bruce Whitehead (JPL) and Thomas A. Tombrello, inventors (to NASA) (JPL) Issued 18 Mar. 1980 8 p Filed 7 Nov. 1978 Supersedes N79-12416 (17 - 03, p 0329) Sponsored by NASA
(NASA-Case-NPO-14079-1; US-Patent-4,194,115; US-Patent-Appl-SN-958573; US-Patent-Class-250-308; US-Patent-Class-250-307) Avail: US Patent and Trademark Office CSCL 07D

An apparatus for determining helium to hydrogen ratios in a gaseous sample is presented. The sample is bombarded with alpha particles created by a self contained radioactive source and scattering products falling within a predetermined forward scattering angular range impact a detector assembly. Two detectors are mounted in tandem, the first completely blocking the second with respect to incident scattering products. Alpha particle/hydrogen or alpha particle/helium collisions are identified by whether scattering product impacts occur simultaneously in both detectors or only in the first detector. Relative magnitudes of the two pulses can be used to further discriminate against

other effects such as noise and cosmic ray events.

FAST FOURIER TRANSFORM SQUARE WAVE VOLTAMMETRY Ph.D. Thesis
David Payne Binkley 1979 342 p
Avail: Univ. Microfilms Order No. 8005211

Fast Fourier transforms are introduced as a unique digital data handling tool for square wave voltammetry. The technique developed performs the current differencing scheme in the spatial frequency domain over spatial frequencies which are noise free. The technique is verified experimentally with solutions of lead (II) in HC1 and thallium (I) in HNO3. A FFT linear parameter estimation analysis is introduced as a digital data manipulation technique for fused peak analytical systems. The algorithm is tested theoretically and experimentally on various ratios of lead (II) to thallium (I) in nitric acid where the peak separation is approximately 70 millivolts. The algorithm performs the calculation over noise free spatial frequencies and significantly reduces the complexity of the calculation relative to the conventional case.

TIME RESOLVED ANALYSIS OF FLUORESCENT METAL CHELATES Ph.D. Thesis
Thomas Lee Craven 1979 131 p
Avail: Univ. Microfilms Order No. 8005850

Salicylidene-o-aminophenol (SoAP) is found to be a suitable ligand for the time resolved fluorescence analysis of group 3A metal ions. Results of studies on SoAP and on ion pair complexes of rhodamine B show that a correlation exists between bond strength and metal to metal fluorescence lifetime variations, and that a heavy atom effect model provides a means for the evaluation of ligands for time resolved fluorescence analysis. A propagation of errors treatment resulted in a more precise evaluation of a chelate system by the heavy atom effect. Precision in the multicomponent analyses was considered, both through guidelines for the determination of the fluorescence lifetime and through a propagation of errors treatment that includes lifetime uncertainties in multicomponent analysis. Two component time resolved analyses of aluminum and gallium via SoAP and three component analyses of group 3A metals were demonstrated. Dissert. Abstr.

SELECTED ION FRAGMENTATION WITH A TRIPLE QUADRUPOLE MASS SPECTROMETER Ph.D. Thesis
Richard Alan Yost 1979 105 p
Avail: Univ. Microfilms Order No. 8006213

The triple quadrupole system is a simple and efficient implementation of the selected ion fragmentation technique, whereby several ionic species are generated from a sample, ions of a particular mass are selected for fragmentation, and the resulting fragment ions are mass analyzed. The instrument consists of, in series, a dual chemical ionization/electron impact ionization source, a quadrupole mass filter, an RF-only quadrupole that can be pressurized with a collision gas, a second quadrupole mass filter, and an electron multiplier. The ion fragmentation process is performed by collision-induced dissociation, in which the ion acquires internal energy by collision with a neutral molecule. The RF-only quadrupole collision chamber provides focusing of scattered ions. The instrument is described and its performance evaluated.

THERMAL REACTOR AND PROCESS Patent Application
Harry Levin, inventor (to NASA) (JPL) Filed 29 Feb. 1980 19 p
(Contract NAS7-100)
(NASA-Case-NPO-14369-1; US-Patent-Appl-SN-126063) Avail: NTIS HC A02/MF A01

A thermal reactor for pyrolytically decomposing silane gas into liquid silicon and hydrogen gas is presented. A water cooled injection probe introduces the silane tangentially into a reaction chamber heated well above the decomposition temperature of silane. An outer downwardly moving vortex containing the liquid silicon and an inner upwardly moving vortex containing hydrogen gas are formed. The liquid silicon deposits into the interior walls of the reaction chamber to form an equilibrium skull layer which flows to the bottom of the reaction chamber where it is removed. The hydrogen gas is removed from the top of the reaction chamber by a vortex finder.

(Contract N00014-75-C-1143; Proj. SQUID)
(AD-A078625; SQUID-US-1-PU-Vol-1) Avail: NTIS HC A06/MF A01 CSCL 21/2

High frequency response measurement techniques are used with data processing and conditional sampling to measure large eddy structure and coherence in the transitional flow region of turbulent diffusion flames. Comparisons are made between nonburning and burning flow conditions; these show physical similarity for cold and burning flows in the transitional region. Flow visualization shows quasi-laminar interface layers which are distorted, stretched and convoluted by vortex interactions. High-speed Schlieren color movies show axisymmetric wave and vortex ring formation. Velocity, temperature and ionization density measurements show that the transitional flow and the potential core of the jet are much longer in the flame than in the nonburning jet. A marked difference is found between the initial fundamental instability frequencies of the shear layers; the most amplified frequency predicted by stability theory for cold inviscid flow is found in the cold jet but not the flame. Increase in viscosity due to heat release causes delay and damping of the processes of vortex formation and coalescence; dilatation and buoyancy forces also contribute to differences between the flame and cold jet. Large eddies are shown to play an important role in the transitional region of turbulent jet flames.

EXTREMAL EFFECTS IN ROTATIONALLY INELASTIC DIFFRACTION Ph.D. Thesis

Lynn Charles Rathbun Mar. 1979 133 p refs
(Contract DAAB07-72-C-0259; Grant NSF DMR-76-82088)
(AD-A077151; UILU-ENG-78-2230; R-840) Avail: NTIS HC A07/MF A01 CSCL 07/4

The scattering of the hydrogenic molecules H2, D2, and HD from vacuum cleaved MgO (001) along the (110) azimuth has been studied. A thermal beam at 300 K and 80 K was used. Particular emphasis has been placed on the rotational inelastic processes which accompany diffraction of HD. Singularities in the scattering amplitude for the rotationally inelastic events have been found to significantly effect the scattered distributions. This effect, extremal scattering, has been explained in terms of a simple mechanism, allowing accurate calculation of the scattering profiles and angles. The scattering of helium along both the (110) and the (100) azimuths has also been studied. Anomalous shifts and structure have been seen in the diffraction lobes for scattering along the (110) azimuth. These are explained in terms of a wavelength dependent transition probability, calculated in the semiclassical approximation. GRA

MODELS FOR THE PHOTOELECTROLYTIC DECOMPOSITION OF WATER AT SEMICONDUCTING OXIDE ANODES Interim Report
J. H. Kowalski, K. H. Johnson, and H. L. Tuller 31 Dec. 1979 23 p refs
(Contracts N00014-78-C-0970; N00014-78-C-0366)
(AD-A079469; Rept-10) Avail: NTIS HC A02/MF A01 CSCL 07/4

Surface states at semiconducting TiO2/electrolyte interfaces are believed to play an important role in charge transfer and thereby the efficiency of photoelectrochemical processes at such interfaces. Theoretical calculations were therefore performed using the SCF-Xalpha-SW method to determine the position and character of surface states at various characteristic interfaces. At the TiO2/water interface, antibonding surface states were found which when occupied would explain the experimentally observed dissociation of water into hydroxyl groups at n-type semiconducting TiO2 surfaces. Similarly, antibonding surface states were found at the TiO2/OH interface which when occupied would tend to destabilize the OH bond. A likely mechanism for the dissociation of water and decomposition of certain photoanodes in photoelectrochemical cells based on the above results is presented. The effects of surface reconstruction at heavily reduced TiO2 surfaces on the validity of our calculations are also discussed. GRA

MOLECULAR ORBITAL CRITERIA FOR REDUCTIVE ELIMINATION FROM ORGANOTRANSITION-METAL COMPLEXES Interim Report
A. C. Balazs, K. H. Johnson, and G. M. Whitesides Dec. 1979 16 p refs
(Contract N00014-75-C-0970)
(AD-A079447; Rept-9) Avail: NTIS HC A02/MF A01 CSCL 07/4

The following molecular-orbital criteria for bond reforming and reductive elimination from organotransition-metal complexes have been found: (1) The existence of an occupied molecular orbital that is antibonding between the metal (M)site and reactants (H, CH3) and bonding between the reactants (H, CH3); and (2) This orbital should be the highest or nearly highest occupied molecular orbital of the metal-reactant complex for the reaction to occur at low temperature. The difference between the energy of this orbital and that of the highest occupied orbital, if nonzero, is a qualitative indication of the relative facility of the bond reforming activation energy. GRA

PERFORMANCE OF A GEL PERMEATION CHROMATOGRAPH AND ITS USEFULNESS IN EXAMINING MIXTURES OF ORGANIC MATERIALS
Ivan Grabovac and Carolyn E. M. Morris Jan. 1979 35 p refs
(AD-A079953; MRL-R-725) Avail: NTIS HC A03/MF A01 CSCL 07/4

As part of a programme of assessing the molecular properties of organic materials of defence interest, the performance of a locally designed gel permeation chromatograph fitted with a refractive index (R.I.) detector and an evaporative analyser (E.A.) detector has been examined. It was found that with the R.I. detector the performance is similar to that of other instruments. The response of the E.A. detector was found to depend on a number of operating conditions in an unforeseen manner which limits the usefulness of this detector. However, molecular weight distributions determined with the E.A. detector showed good agreement with the R.I. results. Using the two detectors simultaneously, a study has been made of a complex mixture of epoxy resins (an aircraft adhesive) and it has been shown that information relevant to the performance of advanced organic materials can be provided by such studies. THEORETICAL AND COMPUTATIONAL APPROACH TO MODELING FLAME IGNITION Interim Report
Elaine S. Oran and Jay P. Boris 18 Dec. 1979 30 p refs
(RR0240241)
(AD-A079306; NRL-MR-4131) Avail: NTIS HC A03/MF A01 CSCL 21/2

In this paper, time-dependent results obtained from a simplified but nonlinear analytic similarity solution and a detailed numerical simulation are used to study the relations between the fundamental processes occurring in the very early stages of flame ignition in homogeneous premixed gases. The parameters which may be varied are the composition of the mixture, the initial radius of energy deposition R sub 0, the duration of the heating TAN SUB 0, and the total energy deposited in the system E sub 0. The similarity solution plus the ignition delay times Tau sub c for the fuel-oxidizer mixture as a function of temperature can be used to calculate whether or not a given energy source is adequate to ignite the system. This simple procedure may then be calibrated using the time-dependent NRL detailed reactive flow models. The models include the thermophysical properties of the mixture, a full chemical kinetics scheme, the nonlinear convection of self-consistent fluid dynamics and the matrix molecular diffusion coefficients for the individual species. Results are presented for a selected mixture of H2-O2-N2 for two values of R sub 0 which show that a model must be constructed for a quench volume in order to complete the similarity solution calibration. Measurements with a tunable diode laser absorption system have been conducted in steady, fluctuating and sooting atmospher-

ic-pressure flames produced in either a flat flame or a slot burner. Parameters measured include temperature, CO species concentration and CO spectroscopic parameters (line strengths and collision half widths). The measurements involve rapidly scanning the narrow-linewidth diode laser across individual vibration-rotation lines in the fundamental band of CO at 4.6 microns to record fully-resolved absorption line profiles in times as short as 100 microseconds. A conventional microprobe sampling system has been used to monitor CO and CO2 concentrations to enable comparisons between laser-based and conventional probe-based measurements; thermocouples have been used to allow comparisons with laser-based temperature measurements. Results in fuel-rich flames show good agreement between the laser-based and probe-based measurements. Work is in progress to extend the measurements to fuel lean stoichiometries. Work has progressed on assembly and checkout of a new facility for studies of the dynamics of fluctuating or turbulent combustion flows. The facility generates a two-dimensional shear flow which will be used to study the coupling between fluid dynamic and chemical processes in a turbulent mixing layer. GRA

The research is divided into combustion diagnostics and analytical gas phase atomic and molecular spectrometry. New and improved techniques to spatially and temporally measure flame gas temperatures and species have been and are being developed. These techniques are all based upon fluorescence detection. By measuring the ratio of two fluorescence transitions (in a probe, such as indium) excited with two different wavelengths, the flame temperature can be measured with a precision and accuracy better than 50 K. The two main temperature techniques developed depend upon either the linear relationship between fluorescence and the excitation flux on the approach to saturation of the fluorescence with high excitation fluxes. The measurement of total species concentrations in flames and fluorescence quantum efficiencies is readily performed by measurement of the absolute fluorescence flux reaching a calibrated detector as a function of absolute laser flux. A rather simple graphical method allows both species concentration and species fluorescence quantum efficiencies to be measured. GRA

COMBUSTION OF METHANOL COAL SLURRIES IN HARTMANN RESONATOR Final Report, 15 Aug. 1977 - 15 Mar. 1979
S. C. Kranc Mar. 1979 31 p refs
(Grant EF-77-G-01-2744)
(FE-2744-T2) Avail: NTIS HC A03/MF A01

A series of experiments were conducted to determine the combustion characteristics of mixtures of finely pulverized coal suspended in methanol. Such mixtures could be attractive alternate fuels since the advantages of methanol combustion are retained while raising the heating value on a mass basis. A second major aspect of this study was concerned with the development and application of the Hartmann atomizer to deliver the fuel. This is an air atomizer which produces intense gas pulsations that help to disrupt and disperse the fuel. Fuel mixtures using several coal types were tested. The fuels were burned in the wake of a disk baffle incorporating the atomizer and located in a water jacketed flame tube. Measurements of heat deposited in the water jacket and exhaust gas were made. Analysis of the data indicates that the coal suspension compare favorably to pure methanol under test conditions. DOE

TIME RESOLVED SPECTROSCOPY USING SYNCHROTRON RADIATION Ph.D. Thesis
E. D. Poliakoff Aug. 1979 112 p refs
(Contract W-7405-eng-48)
(LBL-9475) Avail: NTIS HC A06/MF A01

The use of synchrotron radiation for spectroscopic studies of the dynamic processes occurring in gas phase systems is discussed. A number of synchrotron radiation experiments are described with the majority concerned with the time dependent radiative decay of excited states following pulsed photon excitation. The properties of synchrotron radiation are reviewed and radiative fluorescent decay is discussed. Atomic lifetime measurements are reported and fragment radiative lifetimes following photodissociation are examined. Polarization of fragment fluorescence, to determine excited state electronic symmetry of dissociative surfaces, is described and fast fluorescence timing measurements to determine the excited state lifetimes of Kr and Xe are discussed. A.W.H.

DEVELOPMENT AND APPLICATION OF THE ELECTRO-CHEMICAL ETCHING TECHNIQUE Annual Progress Report
Aug. 1979 57 p refs
(Contract EY-76-S-05-4814)
(ORO-4814-T1) Avail: NTIS HC A04/MF A01

Advances in the development and application of the electrochemical etching technique for thermal and epithermal neutron dosimetry as well as track geometry determinations are discussed. The bulk and track etching rates were studied by evaluating the track geometry during electrochemical etching. The foil surface removed versus etching time for two different etchants at 1000 V, 2 kHz, and 22 C were studied. Results indicated that the bulk etching rates were constant for the two etchants. The track etching rate (as contrasted with the bulk etching rate) is determined by the microscope focus at various depths. The increase of track depth values as a function of etching time for the two etchants are plotted. The track cone angles were determined and found to be much larger for electrochemically etched polycarbonate foils than for most plastics etched with passive chemical techniques. DOE

RESEARCH AND DEVELOPMENT ON A SPIRAL-WOUND MEMBRANE SYSTEM FOR SINGLE-STAGE SEAWATER DESALINATION Final Report
R. L. Riley and C. E. Milstead 31 Oct. 1979 298 p refs
(Contract DI-14-34-0001-7543)
(PB80-114705; W80-01252; OWRT-S-0098(7543)(1)) Avail: NTIS HC A13/MF A01 CSCL 07D

The development of a spiral wound membrane system which approaches theoretical semipermeability and is sufficiently thin to provide transport of water at practical operating pressures and recovery rates for the single stage desalinization of sea water is reported. The thin film composite membranes are based on nitrogen containing polymers supported on a fabric reinforced porous supporting membrane. Tests on the membrane elements are described which determined the stability of the elements as functions of feed temperature, water recovery, dissolved oxygen, and cleaning techniques. Experience with the design, construction, installation, and operation of a reverse osmosis system which utilizes the spiral wound membrane elements is discussed. A.W.H.

PURELY BUOYANT DIFFUSION FLAMES: SOME EXPERIMENTAL RESULTS Final Report
Bernard J. McCaffrey Oct. 1979 52 p refs

(PB80-112113; NBSIR-79-1910) Avail: NTIS HC A04/MF A01 CSCL 21B

Measurements of temperature and velocity using thermocouples and an impact probe were made in the near field of a purely buoyant diffusion flame produced by a porous refractory burner. Based on the time averaged center line value of V and delta T together with photographic records the flame was divided into three distinct regimes: (1) a continuous flame region, starting from the surface of the burner with Y equal to zero at the surface and rising with the height above the burner, Z to the 1/2 power, delta T is constant over this regime. Higher up is (2), an intermittent regime, with pulsating flame exhibiting approximately constant V and delta T tailing with z to the first power. Still higher is (3), the plume region which is most of the time, free of flames as predicted by conventional plume theory. Throughout the three regimes and indistinguishable among these was the consistency of the buoyancy relation. GRA

TESTING THE CORROSION PROTECTION PROPERTIES OF COATINGS BY MEANS OF PULSED DIRECT CURRENT

E. Babel Oct. 1979 19 p refs Transl. into ENGLISH from Plaste und Kautschuk (East Germany), v. 18, no. 12, 1971 p 931-935

(BLL-RTS-11872) Avail: British Library Lending Div., Boston Spa, England

Lacquered test pieces were connected as anodes in a measurement cell containing pure aerated water with a counter-electrode and were subjected to a low dc voltage with a low pulse frequency. The alternation between interruptions in the current and current impulses in the presence of water and atmospheric oxygen produced a concentrated stress equivalent to years of weathering. Resistance-time curves were determined from changes in the current flow, yielding information on the mechanism of corrosion and allowing conclusions to be drawn about the corrosion properties of protective systems on the basis of their specific overall resistance. Information on deficiencies in formulation can be obtained from the nature, size and number of blisters formed and the corrosion products produced. Blister formation also provides information on the watertightness of the protective film. If coatings are applied without defects then the measured results are largely independent of subjective assessments. A.R.H.

N80-20367 Missouri Univ. - Columbia.

APPLICATION OF INELASTIC ELECTRON TUNNELING SPECTROSCOPY TO THE STUDY OF INHIBITION OF ALUMINUM CORROSION Ph.D. Thesis

Recai Mehmet Ellialtiouglu 1979 113 p

Avail: Univ. Microfilms Order No. 8007146

Inelastic electron tunneling spectra contained peaks associated with all of the intermediate and final products which have been suggested in the free radical mechanism for corrosion of aluminum in CCl_4. The inhibitor molecule, formamide, in CCl_4 solution was found to preferentially adsorb on the aluminum oxide surface, suggesting that the inhibition mechanism is surface passivation rather than alteration of the corrosive medium. From the spectra of formamide and its deuterated derivatitives information was obtained on the identity of the adsorbed surface reacted specie, its orientation with respect to the oxide surface, the types of active sites involved, and the nature of the bonding between the oxide and the adsorbate. A model for the mechanism of inhibition by formamide is suggested. Dissert. Abstr.

N80-20368 Stanford Univ., Calif.

SUBGRAIN REFINEMENT STRENGTHENING IN STAINLESS STEEL ALLOYS Ph.D. Thesis

Rodney Henry Klundt 1979 265 p

Avail: Univ. Microfilms Order No. 8006320

The influence of subgrains on the elevated temperature deformation behavior of E-Brite 26-1, HT-9, DTO2 and Type 304 stainless steel was investigated. Tests were performed in both compression and torsion. The torsion tests allowed very large strains to be achieved under constant strain rate conditions. Each torsion sample was quenched under load when the test was completed to capture the substructure present during deformation. The quenched structures were evaluated by transmission electron microscopy to correlate the substructural characteristics with the test parameters. Strain-rate-change tests were conducted in compression to determine the degree of strengthening that could be achieved through subgrain refinement. Results are examined for each alloy. Dissert. Abstr.

N80-20369 Stanford Univ., Calif.

LARGE-STRAIN DEFORMATION OF A MILD STEEL AT INTERMEDIATE TEMPERATURES Ph.D. Thesis

David Lee Bourell 1979 250 p

Avail: Univ. Microfilms Order No. 8006293

Commercial grade, 1020 steel was warm rolled below the A1 transformation temperature in a multistep process. A substructure was developed by warm rolling, as evidenced by fine subgrains with high dislocation densities. The subgrain size was independent of warm-working strain, and increased with an increase in warm-working temperature. The room-temperature tensile properties were affected by warm working. The impact behavior is influenced by the crystallographic alignment of weak, cleavage planes in the rolling plane. A qualitative model is used to explain the appearance of cleavage separations, their absence at ambient test temperatures, and the propagation of the main crack in a ductile manner at test temperatures as low as -90 C. Tension testing of warm-worked steels at elevated temperatures revealed that steady-state plastic flow was not attained until strains of about 0.3. Prior warm working appears to have little effect on steady-state plastic flow. Dissert. Abstr.

AN EXPERIMENTAL, LOW-COST, SILICON-ALUMINIDE HIGH-TEMPERATURE COATING FOR SUPERALLOYS

Stanley G. Young and Daniel L. Deadmore 1980 16 p refs To be presented at the Intern. Conf. on Metal Coatings, San Diego, Calif., 21-25 Apr. 1980, sponsored by the Am. Vacuum Soc.

(NASA-TM-81455, E-385) Avail: NTIS HC A02/MF A01 CSCL 11F

An evaluation of a duplex silicon-slurry/aluminide coating is presented. The coating is cyclically tested in Mach 1 combustion gases for oxidation and thermal fatigue resistance at 1093 C and in Mach 0.3 gases for hot-corrosion resistance at 900 C. The base metal superalloys are ViA and B-1900. The coated B-1900 specimens performed much better in oxidation than similar specimens coated with aluminides and almost as well as the more expensive Pt-Al and MCrAlY (where M is Ni and/or Co) coatings deposited by the physical vapor deposition process. The coating also provided good hot corrosion protection. Metallographic, X-ray, and electron microprobe studies are used to characterize the coating, determine failure mechanisms, and study some of the changes due to exposure. M.G.

CHARACTERIZATION OF CASTING DEFECTS IN TYPICAL CASTINGS OF A DIRECTIONALLY SOLIDIFIED SUPERALLOY Final Report, Oct. 1978 - Dec. 1978
J. M. Marder and C. S. Kortovich Aug. 1979 134 p refs
(Contract F33615-76-C-5373; AF Proj. 7351)
(AD-A077270; AFML-TR-79-4060) Avail: NTIS
HC A07/MF A01 CSCL 13/8

A program was conducted to assess the effects of casting defects in directionally solidified (DS) material. The technical approach involved two tasks, the first including the characterization of typical casting defects in F-100 1st and 2nd stage PWA-1422 production turbine blades and the second including the evaluation of thin sheet test specimens cast deliberately to contain defects. The defects included microshrinkage, inclusions and grain misorientation and represented a range of severity levels including conditions exceeding current production acceptance criteria. The analysis of production castings indicated that substantial decreases in the rejection rate could be achieved with only minor relaxation of the acceptability criteria. In addition, dross inclusions were found to be the single most frequent cause for casting rejections. GRA

INFLUENCE OF PURITY LEVEL ON THE MECHANICAL PROPERTIES OF HOT ISOSTATICALLY PRESSED BERYLLIUM
Ben C. Odegard, Jr. Sep. 1979 18 p refs
(Contract EY-76-C-04-0789)
(SAND-79-8232) Avail: NTIS HC A02/MF A01

The procurement of a quantity of ultra-pure beryllium powder combined with special handling from powder to billet form resulted in the fabrication of high purity beryllium. The mechanical properties of these billets were contrasted to those of commercial grade billets to determine the influence of impurities and powder processing. The tensile test results show that the strength values are primarily dependent on the grain size in a behavior predictable by the Hall-Petch relationship. Only a fraction of the strength differential can be attributed to metallic impurities in solution. The grain size is controlled by the powder size distribution. The ductility is dominated by both grain size and oxide content. The fine grained, low oxide billets exhibited the highest ductilities. There is evidence to suggest that oxide distribution has a large influence on the ductility. The fracture toughness was highest for the high purity beryllium billets. DOE

DEVELOPMENT OF A PROCEDURE FOR ESTIMATING THE HIGH CYCLE FATIQUE STRENGTH OF SOME HIGH TEMPERATURE STRUCTURAL ALLOYS
P. Soo and J. G. Y. Chow 1979 21 p refs Presented at the ASME Winter Annual Meeting, New York, N.Y., 2 Dec. 1979
(Contract EY-76-C-02-0016)
(BNL-NUREG-26085; CONF-791205-5) Avail: NTIS
HC A02/MF A01

An evaluation made of the a test procedure involving a fast cycling rate was (40 Hz) and load controlled conditions. The validity of this procedure for extending current fatigue curves from 10 to the fifth power to 10 to the eighth power cycles and beyond, hinges upon the selection of an appropriate effective strain value, since the strain usually changes rapidly during the early stage of fatigue. Results from annealed 2 1/4 Cr-1 MO, type 304 stainless steel, Incoloy 800H and Hastelloy X, tested over a wide range of temperatures, show that the strain measured N/sub f/2 is a reasonable estimate since it gives an excellent correlation between the strain and load controled test in the 10 to the fifth power cycle range where the data overlap. It is

shown that the differences in cycling rate and early stress-strain history for the two tests do not significantly affect the correlation. It may, therefore, be concluded that such load control test procedures may be used as a valid fast way for extending currently available fatigue curves from 10 cycles, and currently available fatigue curves from 10 to the fifth power and 10 to the eighth power and beyond. DOE

CORRELATIONS BETWEEN FRACTURE TOUGHNESS AND MICROSTRUCTURE IN 4140 STEEL, MRL E-113 M.S. Thesis
Trond K. Odegaard Jun. 1979 88 p refs
(Contract EY-76-S-02-3084)
(COO-3084-67) Avail: NTIS HC A05/MF A01

Correlations between the microstructure of an ultra high strength steel and material resistance to fracture, as measured by blunt notch Charpy impact tests and sharp crack K/sub IC/ tests, were investigated for a standard 870 C/oil and an experimental 1175 C/oil austenitizing treatment. The increase in sharp crack toughness with higher temperature austenitizing treatments, for the as-quenched and 200 C/oil temper conditions, was rationalized by a fracture criterion based on the notion that for fracture to occur, a critical strain, epsilon/sub f/, must be achieved over some critical distance, delta. The lath colonies were identified as the fracture controlling microstructural unit, and hence, their size was considered to be the critical distance, delta. Fracture toughness differences between the 870 C and 1175 C austenitizing treatments were qualitatively rationalized by the nature of the respective fracture morphologies. Good correspondence between J/sub IC/ and the so-called tearing modulus, T, as indicators of sharp crack fracture toughness, was observed. DOE

STRAIN HARDENING OF IRON, AXISYMMETRIC VS PLANE STRAIN ELONGATION
A. Razavi and G. Langford 1979 7 p refs Presented at the Intern. Conf. on the Strength of Metals and Alloys, Aachen, West Germany, Aug. 1979
(Contract EY-76-S-02-4072)
(CONF-790801-5) Avail: NTIS HC A02/MF A01

The flow stress of titanium gettered ferritic iron at high strains is measured for various shape changes including axisymmetric elongation and compression and plane strain elongation, both by symmetrical strip drawing and also by asymmetrical pure shear. The flow stress is evaluated after a complex deformation (such as chip cutting) by simple mechanical tests on portions of the macroscopic specimen. The flow stress and the microstructures are sensitive to the shape change employed. Comparative microstructures are shown in the various shape changes. The rate of strain hardening of body centered cubic iron appears to be sensitive to the deformation mode at high strains because of the different microstructures which may be related to the different crystallographic preferred orientations. It is shown that the internal shape change is not necessarily simply related to the external shape change. DOE

NICKEL CONTAMINATED TITANIUM WELD WIRE STUDY
G. R. Coffin and R. L. Sumstine 18 Jul. 1979 20 p
(Contract EY-76-C-07-1570)
(LTR-141-93) Avail: NTIS HC A02/MF A01

Titanium weld wire used to laser weld thermocouples to fuel rods was tested. It was found that the titanium filler wire was contaminated with nickel which was jacketed on the wire prior to the drawing process. A method was developed to inspect all filler wire for welding application. This method not only indicates the presence of nickel contamination but indicates quantity of contamination. The process is capable of the high speed inspection necessary for various high speed manufacturing processes. DOE

PRODUCTION OF ALUMINUM-SILICON ALLOY AND FERROSILICON AND COMMERCIAL PURITY ALUMINUM BY THE DIRECT REDUCTION PROCESS, PHASE B Interim Technical Report, 1 Mar. - 31 May 1979
Marshall J. Bruno Jun. 1979 22 p refs
(Contract EC-77-C-01-5089)
(CONS/5089-7; ITR-3) Avail: NTIS HC A02/MF A01

The effect of volatile sweep rate on bridge formation and product yield was determined. Higher volatile rates resulted in decreased yields and wider zones of condensation in the shaft. Attempts to charge ores and reduction carbon separately produced very low yields of metallic alloy. Remelt tests of reactor alloy products required temperatures of 1900 C for samples high in Ti. Low Ti-containing alloys melted at 1300 C. Operation of the O2 injected, side entry bench reactor was erratic and inconsistent due to formation of chemical burden bridging. Ferrosilicon alloy products containing 2 to 14% Al were made. Tendency for burden bridging was reduced. Cold modeling studies and compressive strength and abrasion resistance tests results are examined as well as those from fractional crystallization and remelt experiments. DOE

COMPUTER SIMULATION OF THE MARTENSITE TRANSFORMATION IN A MODEL TWO-DIMENSIONAL BODY
Sheree Chen, A. G. Khachaturyan, and J. W. Morris, Jr. Jun. 1979 7 p refs Presented at the Intern. Conf. on Martensite Transformations, Boston, 24-29 Jun. 1979
(Contract W-7405-eng-48)
(LBL-9346; CONF-7906103-1) Avail: NTIS HC A02/MF A01

An analytical model of a martensitic transformation in an idealized body is constructed and used to carry out a computer simulation of the transformation in a pseudo two dimensional crystal. The reaction is assumed to proceed through the sequential transformation of elementary volumes (elementary martensitic particles) via the Bain strain. The elastic interaction between these volumes is computed and the transformation path chosen so as to minimize the total free energy. The model transformation shows interesting qualitative correspondencies with the known features of martensitic transformations in typical solids. DOE

EFFECT OF HEAT TREATMENT ON FRACTURE OF TYPE 304L STAINLESS STEEL IN A HYDROGEN ENVIRONMENT
G. R. Caskey, Jr. and J. A. Donovan 1979 19 p Presented at the TMS-AIME Fall Meeting, Milwaukee, 16-20 Sep. 1979
(Contract EY-76-C-09-0001)
(DP-MS-79-18; CONF-790910-3) Avail: NTIS HC A02/MF A01

Thermal treatments significantly effect the mechanical behavior of Type 304L stainless steel tested in a high-pressure (69 MPa) hydrogen environment. A grain size increase from 10 to 350 micron m increased susceptibility to hydrogen damage and accentuated changes in fracture morphology. The Hall-Petch relation for yield strength was the same for tests in both hydrogen and helium environments. Sensitization increased ductility loss in hydrogen but did not change the fracture mode of smooth bar tensile specimens. Variation in quench rate from 0.25 to 50 K/sec had only a minor influence on susceptibility of hydrogen embrittlement. The absence of an abrupt load drop at fracture and change in fracture morphology for tests in high pressure hydrogen indicate that fracture initiated at or near the surface and rapidly propagated inward. DOE

FATIGUE CRACK PROPAGATION IN HASTELLOY X WELD METAL
T. Weerasooriya Nov. 1979 24 p refs
(Contract W-7405-eng-26)
(ORNL/TM-6999) Avail: NTIS HC A02/MF A01

The fatigue crack growth rate of Hastelloy X weld metal increased with stress intensity, temperature, and inverse frequency. The results were correlated with the equation da/dN = (delta K)/sup n/, for constant frequency or constant temperature. The values of A and n were computed with a linear regression algorithm. With decreasing frequency at constant delta K and constant temperature (538 C) fatigue crack growth rates approach an upper limit. Fatigue crack growth rate of the weld metal was lower than that reported for base metal at 538 C and lower at 649 C for a frequency of 1 Hz. DOE

GRAIN-BOUNDARY DIFFUSION: STRUCTURAL EFFECTS, MODELS AND MECHANISMS
N. L. Peterson 1979 59 p refs Presented at the Am. Soc. of Metals Seminar, Milwaukee, 15-16 Sep. 1979
(Contract W-31-109-eng-38)
(CONF-7909100-1) Avail: NTIS HC A04/MF A01

Anisotropy, effect of orientation, crystallographic transformation, boundary type, dislocation dissociation, pressure, and isotope effects were considered. Diffusivity is different for various boundaries. Dissociated dislocation and stacking faults are not efficient paths for grain boundary diffusion. Results suggest a vacancy mechanism along the dislocation core, and involves atomic jumps away from the back towards the dislocation as well as jumps along the core. Measurements were made on nickel and silver. DOE

PRESSURE SINTERING AND CREEP DEFORMATION: A JOINT MODELING APPROACH Progress Report, 1 Jan. - 31 Dec. 1979
M. R. Notis Oct. 1979 22 p refs
(Contract EY-76-S-02-2408)
(COO-2408-6) Avail: NTIS HC A02/MF A01

Work related to microchemical and microstructural aspects of the joint modeling of pressure sintering and creep in ceramic oxides is reported. Quantitative techniques for the microchemical analysis of ceramic oxides and for the examination of impurity segregation effects in polycrystalline ceramic materials were developed. This has included fundamental absorption corrections for the oxygen anion species as a function of foil thickness. The evolution in microstructure during the transition from intermediate stage to final stage densification during hot pressing of cobalt oxide and preliminary studies with doped oxides were studied. CRYSTALLIZATION AND IRRADIATION EFFECTS IN AN AMORPHOUS ALLOY OF TYPE Fe40Ni38Mo4B18
N. Azam, L. LeNaour, C. Rivera, P. Grosjean, P. Sacovy, and J. Delaplace 1979 16 p refs Transl. into ENGLISH from J. Nucl. Mater. (Netherlands), v. 83, 1979 p 298-304
(PNL-TR-372) Avail: NTIS HC A02/MF A01

The structure of an amorphous alloy of the composition Fe40Ni38Mo4B18 either in the untreated fabricated state, or after various thermal treatments, or after irradiation with heavy ions is studied. The amorphous state is not modified by heat treatments at temperatures below 300 C. After several hours at 350 C, crystallization begins by forming crystals of an FeNi-base solid solution. The crystallization is complete after a two hour treatment at 500 C. This alloy, bombarded with 500 keV Ni(+) ions, proved to be practically insensitive to irradiation at the ambient temperature at high doses (6 x 10 to the 18th power ions/sq cm, i.e., approximately 100 dpa). A 100 to 150 C lowering of the crystallization temperature is observed under irradiation. DOE

THE EFFECT OF PLASTIC DEFORMATION ON THE TRANSPORT OF HYDROGEN IN NICKEL
M. Kurkela and R. M. Latanision Sep. 1979 9 p refs Submitted for publication
(Contract N00014-78-C-0002; NR Proj. 036-127)
(AD-A077660; TR-3) Avail: NTIS HC A02/MF A01 CSCL 11/6

The permeation of hydrogen into crystalline metals may occur in part by lattice diffusion, by grain boundary, or other short circuit diffusion, or, in the case of specimens undergoing plastic deformation, by dislocation transport. In this work, electrochemical permeation measurements indicate that the apparent diffusivity of hydrogen is increased by several orders of magnitude when permeation specimens are plastically deformed and simultaneously charged with hydrogen. SYNTHESIS, CHARACTERIZATION, AND PROPERTIES OF ISOPRENE-METHYL METHACRYLATE COPOLYMERS Ph.D. Thesis
Alexander Sfirakis. 1979. 231 p.
Avail: Univ. Microfilms. Order No. 8001474

A series of well characterized isoprene-methyl methacrylate copolymers and the corresponding homopolymers were prepared by an emulsion polymerization technique at 50 C using a modified GR-S formulation. An equation was developed relating the glass transition temperature to the density of the copolymer. The dependence of penetrant transport properties on penetrant molecular size and on the composition of the copolymers was investigated along with dynamic mechanical and dielectric properties of the polymers. The knowledge obtained from this investigation is desirable for elucidation of structure property relationships, plasticization phenomena, and any modification of polymer structure induced by the presence of penetrants. Dissert. Abstr.

N80-20396 Washington State Univ., Pullman.
ELECTROCHEMICAL POLYMERIZATION AND DEPOSITION ON CARBON FIBERS Ph.D. Thesis
James Jerome Jakubowski. 1979. 124 p.
Avail: Univ. Microfilms. Order No. 8007240

The electrodic polymerization on carbon fibers of a variety of monomers having different functional groups was investigated. The effect of such polymer coating on the properties of polymer composites prepared from the coated fibers was demonstrated. The electropolymerization of novel monomers was pursued in some detail. In addition to usual vinyl polymerizations, some novel cyclic monomers were identified as capable of producing the desired polymer layer on fibers under appropriate polymerization conditions. In many instances, grafting of the surface polymer to the fiber was observed. Composite specimens were prepared by the incorporation of the coated fibers in an epoxy matrix. It was demonstrated that the effect of electropolymerization on the interfacial properties of the resulting composite was manifested in variations of the measured interlaminar shear and impact strengths of the composite specimens. Other observations are reported. Dissert. Abstr.

COMPOSITE WALL CONCEPT FOR HIGH TEMPERATURE TURBINE SHROUDS: SURVEY OF LOW MODULUS STRAIN ISOLATOR MATERIALS
Robert C. Bill, Gordon P. Allen, and Donald W. Wisander. Mar. 1980. 27 p. refs. Presented at the 25th Ann. Intern. Gas Turbine Conf., New Orleans, 9-13 Mar. 1980; sponsored by ASME. Prepared in cooperation with Army Aviation Research and Development Command, Cleveland.
(NASA-TM-81443; AVRADCOM-TR-80-C-7; E-363). Avail: NTIS. HC A03/MF A01. CSCL 11A.

Plasma sprayed yttria stabilized zirconium oxide turbine seal specimens, incorporating various low modulus porous metal strain isolator pads between the zirconium oxide and a dense metal substrate, were subjected to cyclic thermal shock testing. Specimens that had a low modulus pad composed of sintered FeNiCrAlY fibermetal survived 1000 thermal shock cycles without spalling of the ceramic. A figure of merit for the low modulus pad materials taking into consideration the elastic modulus, thermal conductivity, strength, and oxidation resistance of the pad was proposed, and showed reasonable agreement with the thermal shock results. A potential surface distress problem on the zirconium oxide, associated with nonuniform temperature distribution and rapid stress relaxation was identified. One approach to solving the surface distress problem through application of laser surface fusion of the zirconium oxide layer showed some promise, but improvements in the laser surface fusion process are necessary to prevent process associated damage to the ceramic. John A. Woollam, inventor (to NASA) Issued 18 Mar. 1980 3 p Filed 29 Sep. 1977 Supersedes N78-19907 (16 - 10, p 1365) Division of U.S. Patent Appl. SN-67432, filed 13 Apr. 1976, US Patent-4,077,788

(NASA-Case-LEW-12081-2; US-Patent-4,193,827; US-Patent-Appl-SN-837794; US-Patent-Class-149-1; US-Patent-Class-423-648R; US-Patent-Appl-SN-676432) Avail: US Patent and Trademark Office CSCL 21D

Atomic hydrogen, for use as a fuel or as an explosive, is stored in the presence of a strong magnetic field in exfoliated layered compounds such as molybdenum disulfide or an elemental layer material such as graphite. The compound is maintained at liquid temperatures and the atomic hydrogen is collected on the surfaces of the layered compound which are exposed during delamination (exfoliation). The strong magnetic field and the low temperature combine to prevent the atoms of hydrogen from recombining to form molecules.

EXPERIMENTAL LABORATORY MEASUREMENT OF THERMOPHYSICAL PROPERTIES OF SELECTED COAL TYPES Final Report

William G. Lloyd 13 Sep. 1979 113 p refs Prepared for JPL

(Contracts NAS7-100; JPL-955381)

(NASA-CR-162913; JPL-9950-317) Avail: NTIS HC A06/MF A01 CSCL 21D

A number of bituminous coals of moderate to high plasticity were examined, along with portions of their extrudates from the JPL 1.5-inch 850 F screw extruder. Portions of the condensed pyrolysis liquids released during extrusion, and of the gaseous products formed during extrusion were also analyzed. In addition to the traditional determinations, the coals and extrudates were examined in terms of microstructure (especially extractable fractions), thermal analysis (especially that associated with the plastic state), and reactivity towards thermal and catalyzed hydroliquefaction. The process of extrusion increases the fixed carbon content of coals by about 5% and tends to increase the surface area. Coals containing 25% or more DMF-extractable material show an increase in extractables as a result of extrusion; those initially containing less than 20% extractables show a decrease as a result of extrusion. Both the raw and extruded samples of Kentucky no. 9 coal are highly reactive towards hydroliquefaction, undergoing conversions of 75 to 80% in 15 min and 85-94% in 60 min in a stirred clave. A.R.H.

EVALUATION OF FUEL CHARACTER EFFECTS ON THE F101 ENGINE COMBUSTION SYSTEM Final Report, 1 Aug. 1977 - 30 Sep. 1978

O. C. Gleason, T. L. Oller, M. W. Shayeson, and D. W. Bahr Jun. 1979 200 p refs

(Contract F33615-77-C-2043; AF Proj. 3048)

(AD-A077860; R79AEG405; AFAPL-TR-79-2018; CEEDO-TR-79-07) Avail: NTIS HC A09/MF A01 CSCL 21/4

Results of a program to determine the effects of broad variations in fuel properties on the performance, emissions and durability of the General Electric F101 augmented turbofan engine main combustion system are presented. Combustor rig tests conducted at engine idle, takeoff, cruise, dash, cold day ground start and altitude relight operating conditions with 13 different fuels are described. Fuel nozzle fouling tests conducted with the same fuels are also described. The test fuels covered a range of hydrogen contents (12.0 to 14.5%), aromatic type (monocyclic and bicyclic), initial boiling point (285 to 393 K), final boiling point (552 to 679 K) and viscosity (0.83 to 3.25 millimeters 2/s at 300 K). At high power conditions, fuel hydrogen content was found to have a very significant effect on liner temperature, smoke, and NOx levels. While smoke levels decreased with increasing hydrogen content, the levels were very low with all the fuels. At idle conditions, CO and HC levels correlated with fuel atomization/volatility parameters, but showed no relationship to hydrogen content. Cold day ground start and altitude relight also correlated with fuel atomization/volatility parameters, but showed no dependence on hydrogen content. Combustor liner life analyses yielded relative life predictions of 1.00, 0.72, 0.52, and 0.47 for fuel hydrogen contents of 14.5, 14.0, 13.0, and 12.0 percent, respectively. At the present state of turbine stator development, no fuel effect on life is predicted. Extended cyclic fuel nozzle valve gumming tests revealed significant effects of fuel type and temperature on nozzle life. The results correlated with laboratory thermal stability ratings of the fuels based on tube deposits alone. GRA

TNT EQUIVALENCY OF BENITE PROPELLANT

M. F. Leondi and J. P. Chaltagirone Aug. 1979 56 p

(AD-A077108; AD-E400354; ARLCD-TR-79017) Avail: NTIS HC A04/MF A01 CSCL 19/1

In support of the Army-wide modernization program, the Manufacturing Technology Div of the U.S. Army Armament Research and Development Command developed design standards for structures required to withstand the effects of an explosion. The use of these standards--in a safe and cost effective manner--requires that the airblast characteristics of the energetic materials used by the Army be empirically determined. Since the air blast capabilities of Benite propellant are not available in the current literature, a TNT equivalency test program was initiated. Its objective was to determine the maximum airblast output from detonation of Benite propellant in terms of peak pressure and positive impulse compared to known characteristics of a hemishperical surface burst of TNT. Peak side-on blast overpressure and scaled positive impulse were measured for Benite propellant, using configurations that simulate the handling of bulk material during processing and shipment. Quantities of 10.43 and 41.8 kg were tested in orthorhombic shipping containers and fiberboard boxes. TNT equivalency values for each test series were obtained as a function of scaled distance by comparison to known pressure, arrival time, and impulse characteristics for hemispherical TNT surface bursts. Pressure and impulse equivalencies were found to be less than 65% for all quantities tested. GRA

REFINING AND UPGRADING OF SYNFUELS FROM COAL AND OIL SHALES BY ADVANCED CATALYTIC PROCESSES Quarterly Report, Jan. - Mar. 1979

R. F. Sullivan Apr. 1979 41 p

(Contract EX-76-C-01-2315)

(FE-2315-37) Avail: NTIS HC A03/MF A01

Pilot plant tests on the hydrotreating of SRC-2 process product indicate that this coal-derived feed is suitable for refining using advanced commercial petroleum processing technology. Nitrogen

in the whole SRC-2 process product can be reduced to a concentration of less than 0.5 ppM in a single catalytic stage. Sulfur and oxygen can also be reduced to low levels; and at high severity, most of the aromatic compounds are converted to naphthenes. As the processing severity is decreased, product nitrogen increases and the product becomes more aromatic. In the latter case, further hydrotreating of the naphtha is required before it can be fed to the second stage of a catalytic reformer. Depending on the severity employed, the jet boiling range product must be further hydrogenated for specification jet fuel. Experiments were made to determine appropriate conditions for these processing steps. DOE

At Atlantic Research, erosive burning characteristics of eleven composite propellants were measured and found to agree well with predictions of a simplified first-generation model under most conditions. A second-generation more fundamental model for predicting burning rate versus pressure and cross flow velocity, given only compositional data, also yield predictions in close agreement with data. The most important parameter affecting crossflow sensitivity was no-cross flow burning rate, erosion sensitivity decreasing with increasing base rate. ARAP completed modifications to its SPEC model to enable calculation of cylindrical flows and performed preliminary evaluation for cold-flow simulations and erosive burning. Motor port diameter was identified as a key erosive burning scaling parameter through its effect on threshold conditions, and a simplified scaling relation was developed and verified. In addition, ARAP investigated the effects of combustion-turbulence interaction on predicted erosive burning. Penn State measured erosive burning rates of three AP-composite formulations in a device designed to give a well-defined turbulent boundary layer. The data agreed well with predictions made using a Penn State model based on a 2D turbulent boundary layer approach. Correlations relating burning rate to free stream velocity, and pressure were developed. The model was also extended to axisymmetric cylindrical port flow. GRA

Measurements were completed of the enthalpy of combustion of the ramjet fuel RJ-6. Measurements of the enthalpy of combustion of hexacyclic exo,exo-dihydrodinorbornadiene, hexacyclic endo,endo-dihydrodinorbornadiene and exo-tetrahydrodicyclopentadiene are in progress. Vapor pressure measurements were made on exo-tetrahydrodicyclopentadiene. Synthesis and purification of alkylindans and alkylnaphthalenes with high steric interactions continue at Oklahoma State University. GRA

INITIATION MECHANISMS OF SOLID ROCKET PROPELLANT DETONATION Final Interim Report, 1 Jan. 1975 - 30 Sep. 1979
A. N. Takata Nov. 1979 60 p refs
(Contract F44620-75-C-0059; AF Proj. 2308)
(AD-A079986; IITRI-J6352-FR; AFOSR-79-1324TR; IR-4)
Avail: NTIS HC A04/MF A01 CSCL 21/8

The purpose of this study is to identify mechanisms responsible for several accidental detonation of high-energy solid rocket propellant motors. During the past year a computer model was developed to predict the amount of foam or melt generated in cracks following sudden exposure of the crack to a cavity containing higher temperature/pressure gases than exists within the crack. In addition, an experimental design was developed to study deflagration to detonation transitions (DDT). Analytical predictions suggest that DDT can occur as a consequence of burning propellant cracks provided molten propellant is generated within the burning propellant cracks and the cracks are subjected to sufficiently high amplitude stress waves. The stronger the stress waves are, the less the amount of melt needed for DDT. DDT can be initiated by single burning cracks in close proximity to the motor case, or by multiple burning cracks which are similarly oriented by respect to each other and closely spaced. GRA

SYNTHETIC FUELS FROM PEAT GASIFICATION
D. V. Punwani, S. A. Weil, J. E. Paganessi, and M. J. Kopstein (DOE, Washington, D.C.) 1979 7 p Presented at the 14th Intersoc. Energy Conversion Eng. Conf., Boston, 5-10 Aug. 1979
(Contract EW-78-C-19-0042)
(CONF-790803-55) Avail: NTIS HC A02/MF A01

U.S. peat resources are estimated to be about 1440 quads. Tests were conducted in laboratory and process development unit-scale equipment using peats. It was found that conversion of peat to synthetic fuel is technically feasible. The important gasification characteristics of the three peats is discussed. The peatgas process is described along with highlights of its economics for converting peat to substitute natural gas (SNG), benzene, and fuel oil. On the basis of the gasification characteristics, compared to coal, peat is a better raw material from which to make SNG as well as gasoline blending feedstock, in that a greater fraction of the energy results in these products and requires milder operating conditions. Also compared to coal, peat gasification permits more flexibility in the relative yields of gas and liquid hydrocarbons. The estimates show that the economics of converting peat (containing 50% moisture) to SNG is competitive with those of converting Eastern coal to SNG. DOE

LIQUID PHASE METHANATION/SHIFT PILOT PLANT OPERATION AND LABORATORY SUPPORT WORK Final Report, 1 Jul. 1976 - 30 Nov. 1978
Mar. 1979 330 p
(Contract EX-76-C-01-2036)
(FE-2036-37) Avail: NTIS HC A15/MF A01

The liquid phase methanation (LPM) Pilot Plant construction was completed and shipped to the HYGAS Pilot Plant in Chicago, Illinois. The unit was reassembled and installed. Operations included seven runs totaling 2347 hours of on-stream time with 122 hours of methanation of HYGAS synthesis gas and 193 hours of steam-methane reformer gas. The basic operability of the process was demonstrated in this 50 fold scale-up from a smaller process development unit. Catalyst rate constants were determined and the LPM kinetic model was checked over a wide range of process conditions for three different catalysts. Information accumulated also includes extent of the shift reaction, by-product selectivities, catalyst bed fluidization and circulating

oil stability. An experimental program studying the rates of carbon formation in vapor-phase methanators was conducted. DOE

ADVANCED DEVELOPMENT OF A SHORT-RESIDENCE-TIME HYDROGASIFIER Quarterly Technical Progress Report, 1 Jan. - 31 Mar. 1979
Apr. 1979 86 p refs
(Contract ET-78-C-01-3125)
(FE-3125-5; QTPR-2) Avail: NTIS HC A05/MF A01

Minor modification to the 1-TPH design were made so that the injector could be accommodated within the existing pressure vessel as a nominal 3/4-TPH hydrogasifier injector. One injector made out of Type 321 stainless steel was fabricated and delivered to the test stand. Other existing reactor hardware components were reevaluated with the viewpoint of assessing the need for any modifications. The needed modifications were completed, and all of the hardware was readied for installation at the test stand. Design work on the hydrogen cooled recuperator was initiated. The purpose of the recuperator is to recover the sensible heat from the reaction products by transferring it to the reactant hydrogen. A three module, shell and tube, counterflow type of heat exchanger concept has been chosen for this recuperator, and detailed design drawings were nearly completed. DOE

PHOTOCHEMICAL CONVERSION OF COAL TO GASOLINE IN AN ENTRAINED BED REACTOR Ph.D. Thesis
S. Sundaram Jul. 1979 252 p refs
(Contract EY-76-S-05-5020)
(ORO-5020-T1) Avail: NTIS HC A12/MF A01

Reading anthracite, Pittsburg Hi-Seam, Illinois No. 6, Utah Emery, Montana Rosebud, coals and synthane char were entrained in a rapidly flowing stream of hydrogen and then interacted with photoproduced hydrogen atoms. The reactivity of Illinois No. 6 coal was studied in detail. Products were collected in traps cooled by liquid nitrogen. Gas yields qualitatively decrease in the order given, i.e., with decreasing rank. The gaseous hydrocarbon produced corresponded to gasoline in the C1-C8 range, all isomers present and identified by GC-MS. The liquid products contained benzene, toluene, xylenes, naphthalenes, phenanthrene, pyrene, fluoranthene, benzanthracene, and benzopyrenes. The results suggest that the product distribution, yield and percent conversion are probably controlled by a rate limiting step in which phenanthrene type precursors are cracked from the coal surface and followed by secondary H atom reactions to produce smaller hydrocarbons. DOE

COAL LIQUEFACTION WITH SYNTHESIS GAS
H. R. Appell, R. D. Miller, E. G. Illig, E. C. Moroni, and F. W. Steffgen Sep. 1979 65 p refs
(PETC/TR-79/1) Avail: NTIS HC A04/MF A01

The effects of changing gas composition, temperature, pressure, solvents, catalysts and coal types were studied to better understand the process fundamentals and to lay the groundwork for studies in continuous reactors on a larger scale. A variety of coals were converted in batch autoclaves to a low sulfur fuel oil at temperature of 425 C and pressures of 2200 to 2400 psig, using 1:1 (H2:CO) synthesis gas at reaction times of 30 to 60 minutes at temperature. Although early work suggested that lignites could be readily liquefied without added catalytic agents, later experiments showed that a greatly improved product could be obtained by adding pyrite, which is normally present only in small amounts. Pyrite or, in particular, its reduction product pyrrhotite, appear to be important catalysts for coal liquefaction, and, in general, the reactivity of coals correlates well with the pyrite (or iron plus sulfur) content. DOE

N80-20417# Department of Energy, Pittsburgh, Pa.
TRACE AND MINOR ELEMENT ANALYSES OF COAL LIQUEFACTION PRODUCTS
R. G. Lett, J. W. Adkins, R. R. DeSantis, and F. R. Brown Aug. 1979 37 p refs
(PETC/TR-79/3) Avail: NTIS HC A03/MF A01

The feed coal and products from a single batch of a long term liquefaction run on the 400 lb coal/day process development unit were sampled. Trace and minor element determinations were made on the Virginia hvAb feed coal, gross liquid product, and centrifuged liquid product and centrifuge residue from both the first and second centrifuging of the liquid product. Spark source mass spectrometry was used to determine the distribution and general level of about sixty elements. More precise determinations of specific trace (copper, chromium, manganese, nickel, zinc, lead, and cadmium) and minor elements (iron, silicon, aluminum, magnesium, and potassium) were made for elemental balance purposes. Results are compared with those previously obtained from a Kentucky hvBb coal run. Centrifugation of the liquid product from the West Virginia coal results in a preferential removal of iron and several other elements which were not observed in the Kentucky coal run. DOE

N80-20418# Institute of Gas Technology, Chicago, Ill.
DEVELOPMENT OF COMBUSTION DATA TO UTILIZE LOW BTU GASES AS INDUSTRIAL PROCESS FUELS, PROJECT 61004. SPECIAL REPORT NO. 7: PREMIX TUNNEL BURNER
R. T. Waibel and E. S. Fleming May 1979 41 p refs
(Contract EX-76-C-01-2489)
(FE-2489-41) Avail: NTIS HC A03/MF A01

Data were gathered to determine the performance of a premix tunnel burner when retrofit with three low Btu fuel gases. The burner was fired on a pilot scale test furnace with a load simulating one zone of a continuous melting pot or one instant during the heat up of a batch melter. The low Btu fuel gases used for these combustion trials were Koppers-Totzek oxygen, Wellman-Galusha air, and Winkler air. All of the low Btu fuel gases exhibited stable flames when directly retrofit on the burner except Winkler air, which required a pilot flame to prevent blowoff. Koppers-Totzek oxygen gave a thermal efficiency somewhat greater than that for natural gas, while both Wellman-Galusha and Winkler air fuel gases were significantly lower. All of these fuel gases had flame lengths that were longer than that for natural gas. DOE

FLAME PROPAGATION, AUTOIGNITION AND COMBUSTION IN ALCOHOL-PETROLEUM-AIR MIXTURES AND OTHER ALTERNATIVE FUELS Final Report, 1 Aug. 1977 - 31 Dec. 1978
N. A. Henein Sep. 1979 11 p
(Contract EC-77-S-02-4486)
(COO-4486-5) Avail: NTIS HC A02/MF A01

The combination characteristics of the future alternative fuels in gasoline and diesel engines were investigated in order to develop future combustion engines designed for best energy conversion and minimum emissions. The process of combustion was studied both experimentally and theoretically. The experimental work consisted of instrumenting and running tests on three research engines and measuring the different combustion characteristics. The theoretical work included calculating and correlating the flame speed and ignition delay with different fuel and air properties and engine operating parameters. DOE

EXPLORATORY STUDIES IN CATALYTIC COAL LIQUEFACTION Final Report, Jun. 1978 - Mar. 1979
D. D. Whitehurst, T. O. Mitchell, M. Farcsiu, and J. J. Dickert, Jr. Sep. 1979 167 p refs
(EPRI-AF-1184) Avail: NTIS HC A08/MF A01

Catalyst aging tests simulating H-coal conditions with Illinois No. 6 coal were run for approximately 10 days with Cyanamid 1442A (CoMo/Al2O3), Cyanamid NiMo/Al2O3, Armak NiMo/ Al2O3, Amocat 1A (CoMo/Al2O3), and Amocat 1B (Mo/Al2O3) catalysts. Fresh and aged catalysts were examined for hydrogenation, hydrocracking, isomerization, desulfurization, denitrogenation, and deoxygenation. Several minerals were also included in the tests. Fresh commerical catalysts, especially NiMo/Al2O3, appear to be undesirably active for the H-Coal process. All catalysts age extensively but the used catalysts are still quite active. Activities for all reactions are reduced in the presence of nitrogen compounds. It was found that 400 F product mixtures become more complex as catalysts age, and that the catalysts affect especially the highest boiling products, but lose the ability to lower molecular weight as they age. Hydrogen donor catalyst systems are described briefly. DOE

CATALYST CHARACTERIZATION IN COAL LIQUEFACTION Quarterly Report, 1 Apr. - 30 Jun. 1979
M. G. Thomas Oct. 1979 18 p refs
(Contract EY-76-C-04-0789)
(SAND-79-1969; QR-3) Avail: NTIS HC A02/MF A01

A charge of neutron activated CoMo catalyst was prepared for use in the H-Coal Process Demonstration Unit. Catalysts tested in a fixed bed with low ash feedstock and in ebullated and fixed beds with higher-ash containing feedstocks corroborate other evidence that the regions of high reflectivity near used catalyst surfaces are due to the pressure of containment mineral matter, primarily iron and titanium. Parametric experiments with coal, preasphaltene, asphaltene, and oil in tubing reactors show that production of hydrocarbon gases increases in the series oil < asphaltene < preasphaltene, that both a CoMo catalyst and pyrite addition lowers the production of C1 to C4 hydrocarbons, and that pyrite significantly increases the amount of CO and CO2 generated. DOE

STABILITY SURVEY OF HYDROCARBON FUELS Final Report
J. N. Bowden Oct. 1979 35 p refs
(Contract EW-78-C-03-1778)
(BETC-1778-4) Avail: NTIS HC A03/MF A01

The storage stability characteristics of No. 2 diesel fuels, JP-4 turbine fuels, and unleaded and leaded gasolines were evaluated. The 43.3 C storage stability test, which included gum determinations after periods of 4, 8, 16, and 32 weeks, was conducted on all samples. The thermal stability of the JP-4 fuels was also measured. Results indicate that the JP-4 fuels are the most stable, followed by the unleaded gasolines, leaded gasolines, and the diesel fuels. None of the jet fuels showed any degree of deterioration during the 32 weeks of storage, while at least one of each type of gasolines and four diesel fuels appeared to have some measure of unstability. DOE

COAL LIQUEFACTION TEST CENTER Quarterly Technical Progress Report, Oct. - Dec. 1978
Jun. 1979 69 p
(Contract EX-76-C-01-1517)
(FE-1517-78) Avail: NTIS HC A04/MF A01

Repairs from the damage incurred during the August fire were completed along with major modifications to the J-A608C/D hydrogenation reactor recycle pumps. Integrated operation of the Cresap Pilot Plant was carried out for two periods of 24 and 40 hours during Runs 014 and 015. Extraction operations in the front end totaled 37 and 7 hours for these runs. On stream hydrogenation time in section 600 consisted of 154 hours processing feedstock from storage and 64 hours on fresh extract. Because of the short periods of stabilized operation, characterization data collected were minimal. However, it is estimated that depth of extraction was about 75% on coal during each run. Hydrogenation effected about 80% conversion of +880 F material and 60% sulfur reduction in final product. DOE

ZINC HALIDE HYDROCRACKING PROCESS FOR DISTILLATE FUELS FROM COAL Annual Technical Progress Report, 1 Feb. 1978 - 31 Jan. 1979
C. W. Zielke, Melvyn Pell, C. R. Greene, J. T. Maskew, and R. T. Struck 15 May 1979 105 p refs
(Contract EX-76-C-02-1743)
(FE-1743-68) Avail: NTIS HC A06/MF A01

Final results from the continuous bench-scale work showed that single-stage liquefaction of Montana subbituminous coal can be operated up to 427 C and in multiple-stage operation, the final stage at 17.5 MPa can be as high as 496 C without coke formation. This will permit increased throughput and eliminate a melt extraction step in the process. A study of crushing and drying of subbitiminous coal showed that the oxygen level in the drying gases can be controlled to a level where no degradation of the coal results. An economic study comparing direct coal feeding with producing SRC-1 and feeding it to zinc chloride processing showed an incentive for direct coal feeding. DOE

SUPPORT STUDIES IN FLUIDIZED-BED COMBUSTION 1978 ANNUAL REPORT Annual Report, Jul. 1977 - Sep. 1978
I. Johnson, G. J. Vogel, S. H. D. Lee, D. S. Moulton, and F. F. Numes Aug. 1979 112 p refs
(Contract W-31-109-eng-38)
(PB80-112758; ANL/CEN/FE-78-10; EPA-600/7-79-203)
Avail: NTIS HC A06/MF A01 CSCL 13B

Results of laboratory and process scale EPA studies supporting the national development of atmospheric and pressurized fluidized bed combustion (PFBC) of coal are presented. Limestone sulfation enhancement experiments showed CaCl2 and MgCl2 to be more effective than NaCl in increasing the pore size and hence the sulfation capability of calcined limestones. Experiments to evaluate coal pyrolysis char as a feedstock for FBC were conducted on Wyoming subbituminous coal pyrolyzed at about 650 C. Char combustion efficiencies were 94-99 percent. The use of oil shale for SO2 emission control in FBC was evaluated. Considerably larger quantities of shale (than limestone or dolomite) would be required because of shale's lower CaO content. GRA

THE PRESSUREMETER: APPLICATION OF PAVEMENT DESIGN Ph.D. Thesis
Jean-Louis Charles Briaud 1979 467 p
Avail: Univ. Microfilms Order No. 8005516

Special pressuremeter, termed the Briaud pressuremeter, has been designed and built specifically for use in pavement engineering; also, a standard test procedure has been established. Both the special pressuremeter and test procedure are proposed as a basis for the traffic load design of flexible airport pavements. The pressuremeter probe is short and monocellular, and the test measures a cyclic modulus. The short probe allows tests to be performed every 0.3 m from the pavement or ground surface down to a depth of 1.8 m. The Briaud pressuremeter is portable and relatively inexpensive, the test is of short duration, and the results give a direct assessment of the condition of the pavement with depth. Dissert. Abstr.

N80-20433 Tennessee Univ., Knoxville.
SEISMIC DESIGN OF REINFORCED CONCRETE BUILDINGS: AN INELASTIC RESPONSE SPECTRUM APPROACH Ph.D. Thesis
Prospero Dionisio Bernal 1979 212 p
Avail: Univ. Microfilms Order No. 8005367

The applicability of the inelastic response spectrum approach (IRSA) was evaluated as a tool for the design of moment resisting, reinforced concrete frames under seismic excitation. The applicability of this method can be measured by the accuracy (or lack of it) of the predicted inelastic demands when compared to those obtained from a rigorous, step-by-step, inelastic dynamic analysis. In order to test the applicability of the method, two frames were designed for various combinations of ground motions and design ductilities and then analyzed using DRAIN-2D, a computer program with inelastic dynamic analysis capabilities. Design procedures were developed to insure that the inelastic action in the frames designed according to the IRSA would be restricted to the beams. Dissert. Abstr.

SPACE TRUSS DESIGN: THE POLYHEDRAL CHAIN GROUP Ph.D. Thesis
Martin Frank Rooney 1979 219 p
Avail: Univ. Microfilms Order No. 8003410

A method for the structural design of polyhedral chain three dimensional trusses conforming to four connected regular growth patterns is presented. The method employs artificial intelligence search techniques and knowledge of polyhedral truss behavior. An approximate method of analysis, using the behavior of an equivalent centroidal rigid frame to model the behavior of a polyhedral chain structure, is provided. A technique for numbering connector configurations is developed, and the point at which nonlinear behavior ensues is discussed. A FORTRAN program for generating, drawing, and performing geometrically nonlinear analysis on polyhedral chain structures is furnished. Dissert. Abstr.

N80-20435 California Univ., Los Angeles.
SYSTEM IDENTIFICATION STRUCTURAL DYNAMICS: AN APPLICATION TO WIND FORCE ESTIMATION Ph.D. Thesis
Stepan Sahag Simonian 1979 225 p
Avail: Univ. Microfilms Order No. 8007449

A second order nonlinear dynamic programming filter developed to inexpensively handle large order linear dynamical system is applied to the wind force identification problem. The differential equations governing the along wind buffering of multistory structures by gusts are formulated. The floor level acceleration response power spectral density (PSD) matrices are derived in terms of PSD models for wind gusts. A detailed first order sensitivity analysis of the derived auto-PSD models is performed with respect to some unknown stucture and gust model paramters. Using a simulated and noise polluted version of an auto-acceleration PSD data, some of the unknown stuctural and gust parameters are identified using a Monte Carlo version of the recursive nonlinear dynamic programming filter in the frequency domain. Ambient vibration experimental considerations are discussed. Dissert. Abstr.

N80-20436 Washington Univ., Seattle.
STRUCTURAL EVALUATION OF SULPHUR-ASPHALT PAVEMENTS Ph.D. Thesis
Abdulaziz Turki Abdulla Al-Otaishan 1979 737 p
Avail: Univ. Microfilms Order No. 7927736

Sulphur asphalt mixes from a structural standpoint are evaluated. The principles of the rational method of pavement design were used in this study for the evaluation of the four sulphur asphalt test pavements located at US 69, Lufkin, Texas, US 77, Kenedy County, Texas, LA 108, Sluphur, Louisiana, and US 93-95, Boulder City, Nevada. Design curves based on Elastic theory and material equivalencies are reported. Other operational procedures as well as significant results are discussed. Dissert. Abstr.

ANSR-2: ANALYSIS OF NONLINEAR STRUCTURAL RESPONSE, USER'S MANUAL
Digambar P. Mondkar and Graham H. Powell Jul. 1979 90 p refs
(Grant NSF ENV-76-04264)
(PB80-113301; UCB/EERC-79/17; NSF/RA-790266) Avail: NTIS HC A05/MF A01 CSCL 13B

A general purpose computer programs for the static and dynamic analysis of nonlinear structures is described. Both large displacements and inelastic effects are included. Several features of the program are discussed. The most important of these are: (1) a comprehensive restart option; (2) provision to allow static and dynamic analyses in any sequence; (3) provision for static analysis with prescribed nodal displacements as well as nodal loads; (4) provision for out-of-phase support motions to be specified for earthquake analysis; (5) provision for time delay (traveling wave) effects to be specified for forces and displacements in dynamic analyses; and (6) out-of-core solves for both symmetrical and unsymmetrical equations. PAVEMENT RECYCLING-BITUMINOUS CONCRETE AND CONCRETE MIX DESIGNS Interim Report, Oct. 1978 - Mar. 1979
Robert Christman and Keith Lane Jul. 1979 76 p refs
(HPR Proj. 569)
(PB80-106263; FHWA/CT-569-1-79-10) Avail: NTIS HC A06/MF A01 CSCL 13B

Trial mixes developed from both salvaged bituminous concrete and portland cement concrete pavement materials were tested in the laboratory. Salvaged materials investigated included crushed and cold milled bituminous concrete and crushed 40 x 12 ft concrete pavement slabs with wire mesh reinforcing. Laboratory results indicated the feasibility of full scale bituminous recyling projects using central plant mixing of salvaged and virgin aggregate by the heat transfer method and both in place full depth and surface recycling. The concrete tests provided good results in terms of strength properties and demonstrated the potential of concrete recycling. Mesh separation and removal did not present any insurmountable problems. WEB DISTORTION AND FLEXURAL-TORSIONAL BUCKLING
Gregory J. Hancock, Mark A. Bradford, and Nicholas S. Trahair Jun. 1979 29 p refs
(PB80-116221; R-349) Avail: NTIS HC A03/MF A01 CSCL 13M

In an I-section member with a slender, unstiffened web, a combined buckling mode may occur in which the web distorts and reduces the member's torsional resistance, and consequently its resistance to lateral (or flexural-torsional) buckling. An approximate analysis of the effect of web distortion on the elastic flexural-torsional buckling of a simply supported I-section member is presented. This analysis leads to a closed form interaction equation, relating the critical uniform moment and axial load acting on the member. The buckling moments and loads determined from this equation are compared with the results of a more sophisticated finite strip analysis, and are shown to be of high accuracy. The effects of different member cross sections on distortional buckling are investigated. GRA

STATISTICAL INVESTIGATION OF PAVEMENT SKID RESISTANCE DATA Final Report
R. K. Moore and C. M. Ford. Jun. 1979. 239 p. refs. Prepared in cooperation with the Federal Highway Admin., Washington, D.C. and sponsored in part by Alabama State Highway Dept.
(PB80-116114; HPR-89; FHWA/RD-79-S0910) Avail: NTIS HC A11/MF A01 CSCL 13B

Regression analysis was used, with skid number data (2490 cases) measured on the Southern By-Pass (U.S. Highway 80) in Montgomery, Alabama, from 1969 to 1975, to develop equations that predict skid number and skid number ratio. The independent variables included service time, traffic, elapsed time since last rainfall, rainfall amount, aggregate type, aggregate mixture, calendar month, and air temperature at time of test. Logarithmic transformations were also used, but the regression models developed were not satisfactory for prediction purposes as indicated by the coefficient of multiple determination (r squared) and the standard error of estimate. GRA

SATELLITE PERSONAL COMMUNICATIONS SYSTEM Patent
Norman B. Reilly (JPL) and Joel G. Smith, inventors (to NASA) (JPL). Issued 19 Feb. 1980. 9 p. Filed 30 May 1978. Supersedes N78-25275 (6 - 16, p 2101). Sponsored by NASA
(NASA-Case-NPO-14480-1; US-Patent-4,189,675;
US-Patent-Appl-SN-910707; US-Patent-Class-325-4;
US-Patent-Class-325-8; US-Patent-Class-325-9;
US-Patent-Class-325-14) Avail: US Patent and Trademark Office CSCL 17B

Voice channel communication between low power mobile stations dispersed over a large area is provided by a system which includes a geostationary satellite utilizing a large UHF antenna that can receive a transmission from a caller and retransmit it over any one beam of a matrix of narrow beams, so the chosen beam covers an area in which a designated called party is located. A single up-link control channel occupying a narrow frequency band, can be utilized to receive dial up signals from a caller, and another single down link control channel can be utilized to ring up the called party located anywhere within the continental United States. The satellite antenna includes a matrix of feed horns that not only direct the beams in a controlled matrix onto the area of the continental United States, but also permit detection of the region from which the caller's signal is transmitted and the region from which the called party's answer is received, to enable the interconnection of signals received from these two regions. The system is particularly useful for rural areas.

DIGITAL-PHASE METHOD OF FORMING SINGLE SIDE-BAND SIGNALS
Wojciech Stepniewski and Hubert Trzaska. Oct. 1979. 23 p. refs. Transl. into ENGLISH from Prace Inst. Lacznosci (Poland), 1977. p 29-41
(BLL-RTS-11857) Avail: British Library Lending Div., Boston Spa, Engl.

The deficiencies of previous methods of forming single sideband signals are defined and the advantages of using a system which can be tuned over a wide range of frequencies are discussed. Hitherto, it was impossible to construct such a system due to the lack of phase shifters which produce a stable phase shift of + or - pi/2 over a wide range of frequencies. It is proposed to use phase shifters based on flip-flop multivibrators for this purpose. The possibility is also presented of using the harmonics of a balanced mixer supplied with high frequency current of rectangular form. J.M.S.

SUBSTORM-RELATED VLF CHORUS EVENTS: LOCAL-TIME DEPENDENCE AND RELATIONSHIP TO NEWLY-INJECTED CLOUDS OF DRIFTING ENERGETIC ELECTRONS Ph.D. Thesis
Trevor William Thomas. 1979. 253 p.
Avail: Univ. Microfilms Order No. 7921597

VLF chorus, a naturally occurring, electromagnetic wave phenomenon generated in the Earth's magnetosphere during interactions between VLF waves and energetic electrons was studied. The macrostructure of a 9 day period of VLF ground station data, recorded at two antarctic stations was studied using compressed time scale spectrograms. A magnetically quiet period was chosen for analysis, within which isolated substorms occurred. It was found that chorus frequently occurs in events, the most characteristic feature of which is an initial rise in the upper cut off frequency of the chorus band. Two interpretations of the chorus events were investigated based on the time dependence theory. The first model suggests that the observed rise in frequency is due to an inward convection of a bunch of electrons under a substorm enhanced westward electric field. The second model suggests that the dispersion is responsible for the time evolution of the events. Dissert. Abstr.

THEORETICAL AND EXPERIMENTAL STUDY OF THE PROXIMITY EFFECTS OF THIN-WIRE ANTENNA IN PRESSURE OF BIOLOGICAL BODIES Ph.D. Thesis
Khalid Karimullah. 1979. 159 p.
Avail: Univ. Microfilms Order No. 8006140

The electromagnetic coupling caused by placing a biological body in the vicinity of a radiating antenna was studied. A numerical solution to the above mentioned problem is presented and the current distribution on the antenna and the induced electric fields inside the biological body are quantified. Experiments were conducted using a plexiglass container of suitable dimensions filled with saline solution to represent the biological body. Perturbation of input impedance from its free space value is plotted as a function of distance of separation between antenna and the body. Dissert. Abstr.

N80-20452 Michigan State Univ., East Lansing.
INDUCED ELECTROMAGNETIC FIELDS IN CONDUCTING BODIES IRRADIATED BY MAGNETIC FIELDS AND MICROWAVES Ph.D. Thesis
Jen-Hwang Lee. 1979. 248 p.
Avail: Univ. Microfilms Order No. 8006149

A theoretical method for determining the eddy current induced by a uniform RF magnetic field or a beam of RF magnetic field in a biological body is developed. The body of rotational symmetry is subdivided into a number of circular rings with various radii and cross sectional areas. The eddy current induced by the impressed magnetic field is considered, physically, as induced

by a circulatory impressed electric field associated with the uniform impressed magnetic field. The eddy current is the product of the complex conductivity and the induced electric field. Using these relations and the point matching method, a set of simultaneous equations for the induced electric fields is obtained. A numerical method for quantifying the induced EM field on the surface of an irradiated biological body based on two coupled, surface integral equations is also developed. Dissert. Abstr.

MEMORY-BASED FRAME SYNCHRONIZER Patent Application
James K. Niswander and Raymond J. Stattel, inventors (to NASA) Filed 12 Mar. 1980 23 p
(NASA-Case-GSC-12430-1; US-Patent-Appl-SN-129779) Avail: NTIS HC A02/MF A01 CSCL 17B

The memory frame synchronizer is comprised of a serial to parallel converter to convert a serial input data stream to a constantly changing parallel data output. This provides a data format which can be easily and dynamically changed. The process is accomplished using programmable memory arrays to perform the functions of the sync word recognizer and of the counter decoding logic. The parallel data output is supplied to programmable sync word recognizers each consisting of multiplexer and random access memory (RAM). The multiplexer is connected to both the parallel data output and an address bus. The RAM is used as an associative memory or decoder and is programmed with the pattern of binary 1's and 0's necessary to identify a specific sync word. NASA

A STANDARDIZATION EVALUATION POTENTIAL STUDY OF THE COMMON MULTI-MODE RADAR PROGRAM Final Report, Jan. - Sep. 1979
J. Gregory Jolda and Janine L. Thomas Nov. 1979 193 p refs
(AF Proj. 2003)
(AD-A079678; AFAL-TR-79-1195) Avail: NTIS HC A09/MF A01 CSCL 17/9

The cost impact of standardization as applied to Air Force avionic systems is discussed in this report. Several life-cycle cost estimates were made on the ASD Common Multi-Mode Radar program using the Standardization Evaluation Program (STEP) model. Costs for development, operation, and support of a common (standard) radar system are compared with like costs estimated for using individually developed radar systems across applicable aircraft. The STEP model is described, the Common Multi-Mode Radar program is discussed, and the STEP model application to this radar program is documented. STEP estimates project life-cycle costs of unique radar systems to be twice those of a common radar system. Results are discussed in terms of STEP runs and ASD costing estimates, and STEP model use is described. GRA

NEAR-MILLIMETER WAVE TECHNOLOGY BASE STUDY. VOLUME 1: PROPAGATION AND TARGET/BACKGROUND CHARACTERISTICS
Stanley M. Kulpa Nov. 1979 157 p refs
(DA Proj 1L1-61102-AH-44)
(AD-A079620; HDL-SR-79-8-Vol-1) Avail: NTIS
HC A08/MF A01 CSCL 17/9

This study is a comprehensive summary of the Near-Millimeter Wave (100 to 1000 GHz) technology base and its potential applications. The state of the art is reviewed, and technology gaps are identified. Volume 1 contains the results of that portion of the Study devoted to the analysis of various factors influencing atmospheric propagation and target/background signatures. Comparison is made between theoretical predictions and limited experimental data in several key areas. Topics discussed include clear air absorption, the effects of atmospheric particulates (rain, fog, clouds, etc.) turbulence, measurement techniques, and the signature characteristics of a variety of targets and backgrounds at near-millimeter (NMM) wavelengths. A summary is given of research thrusts which would be useful in establishing a more reliable data base for evaluating near-millimeter wave systems applications. Also included is a list of facilities and organizations actively involved in this technology, plus a comprehensive reference list of current and historical literature pertinent to the material in this volume. A VARIATIONAL APPROXIMATION FOR SCATTERING OF SCALAR WAVES BY STOCHASTIC SURFACES
E. P. Gray, R. W. Hart, and R. A. Farrell Jul. 1979 119 p
(Contract N00024-78-C-5384)
(AD-A077066; APL/JHU-TG-1322) Avail: NTIS
HC A06/MF A01 CSCL 20/14

A variational method is developed for the scattering of scalar waves by statistically rough surfaces. It provides a procedure for recasting other approximations so that errors cancel to first order, and also yields a quantity that is indicative of the quality of the approximation. The method is tested by application to a corrugated surface for which some exact solutions are known. Scattering from stocbastically rough surfaces continues to be of importance in many areas, but analytical difficulties generally preclude obtaining an exact solution to significant problems. Accordingly, various approximation methods are used. Since no quantitative index of approximation quality is generally available, there is often doubt not only as to which method is best but even whether any available one is adequate. GRA

ON CORRELATION PARAMETERS FOR SOME BINARY SEQUENCES OF LENGTHS 31 AND 63 FOR SPREAD-SPECTRUM MULTIPLE-ACCESS COMMUNICATIONS M.S. Thesis
David William Haguma Gahutu May 1979 141 p refs
(Contracts DAAB07-72-C-0259; DAAG29-78-C-0016; Grants DAAG29-78-G-0114; NSF ENG-78-06630)
(AD-A077152; UILU-ENG-78-2238; R-845) Avail: NTIS
HC A07/MF A01 CSCL 17/2

The correlation parameters of some binary sequences of lengths 31 and 63 for spread-spectrum multiple-access (SSMA) communication are evaluated. The peak correlation parameters are the key parameters needed to determine the worst interference at any of the correlation receivers in a SSMA communications system due to the presence of other users and the multipath signals. These peak correlation parameters are readily obtained from the correlation data presented in this thesis. The performances of some new and old candidate sieves for optimal binary sequence phases are compared. When the number of binary sequences required exceeds the number in one set of a given family, one option is to use two or more sets of sequences from the family. This motivated the evaluation of the peak cross-correlation between two different sets of Gold sequences of length 31. Finally, the mean-square partial correlation parameters of some binary periodic sequences are computed. GRA

NOISE SUPPRESSION METHODS FOR ROBUST SPEECH PROCESSING Semiannual Technical Report, 1 Apr. - 30 Sep. 1979
Steven F. Boll, Dennis Pulsipher, and H. Ravindra Oct. 1979 70 p refs Sponsored in part by DARPA
(Contract N00173-73-C-0045; ARPA Order 3301)
(AD-A079321; UTEC-CSC-79-163) Avail: NTIS
HC A04/MF A01 CSCL 17/2

Robust speech processing in practical operating environments requires effective environmental and processor noise suppression. This report describes the technical findings and accomplishments during this reporting period for the research program funded to develop real-time, compressed speech analysis-synthesis algorithms whose performance is invariant under signal contamination. Fulfillment of this requirement is necessary to insure reliable secure compressed speech transmission within realistic military command and control environments. Overall contributions resulting from this research program include the understanding of how environmental noise degrades narrow band, coded speech, development of appropriate real time noise suppression algorithms, and development of speech parameter identification methods that consider signal contamination as a fundamental element in the estimation process. This report describes the current research and results in the areas of noise suppression using the dual input adaptive noise cancellation using the LMS and gradient lattice algorithms, to spectral analysis and synthesis using the constant-Q transform, articulation rate change techniques, analytic continuation of band limited signals or signal extrapolation, and two-dimensional automatic gain control. AN ANALYSIS OF PLASTIC SHOCK WAVES IN SNOW
Robert L. Brown Nov. 1979 21 p refs
(Contract DAAG29-78-G-0089; DA Proj. 4A1-61102-AT-24)
(AD-A080051; CRREL-79-29) Avail: NTIS HC A02/MF A01
CSCL 08/12

An analytical study of the propagation of shock waves in snow was carried out to evaluate the response of medium density snow to high rates of loading. One solution was developed for steady shock waves; this resulted in calculation of pressure jump, density jump and stress wave speed. Correlation with available

experimental data was found to be good. Nonsteady shock waves were also considered in order to evaluate wave attenuation rates in snow. Very few data were available to compare with the analytical results, so no definite conclusions on the part of the study could be made. The results show, however, that shock waves that produce plastic deformation attenuate at extremely high rates and that differences in pressure between two waves are quickly eliminated within a short distance. Calculations were also made to evaluate the effect of wave frequency on attenuation rates. The results show that for plastic waves, frequency is not a predominant factor for determining attenuation rates. GRA

HC A11/MF A01 CSCL 17/3

A directional antenna is a filter whose response varies with direction. A modulated signal transmitted from such an antenna produces different farfield waveforms in all directions (except for possible symmetry). The response of a receiver to the transmission will vary with position in the antenna pattern of the emitter. This effect is ordinarily negligible but it could limit the ultimate performance of any system that accepts off-axis signals and relies upon the details of waveform. In a leading-edge TOA system used to determine the location of a pulsed emitter, the several receivers necessarily lie at different angular positions from the emitter. This analysis indicates that in a simple, idealized TOA system that would otherwise be entirely free from error, the waveform effect arising from a directional emitter can lead to errors of several dozen meters in the computed location. HC A04/MF A01 CSCL 17/2

The feasibility of modifying an AN/ZRC-1 multiple single frequency repeater was investigated. The present design used an analog sampling scheme to allow the simultaneous repeating of up to four separate analog voice radio links, using only one frequency per link. It was found that this scheme did not lend itself to wideband digital signals such as those found with the TSEC/KY-58 voice encryption equipment. Instead, a new approach is described which would provide a sampling single frequency repeater for wideband digital signals. GRA

A NOTE ON ALMOST NOISELESS CHANNELS
Barney Reiffen 4 Oct. 1979 20 p Presented at the 1979 IEEE Intern. Symp. on Inform. Theory, Grignano, Italy, 25-29 Jun. 1979
(Contract F19628-80-C-0002; AF Proj. 649L)
(AD-A077588; TN-1979-66) Avail: NTIS HC A02/MF A01 CSCL 17/2

An 'almost noiseless' channel is defined. The definition corresponds to many physical channels operating at high signal-to-noise ratio. Attention is focused on the decrement in capacity and computation cutoff rate as the noise increases from zero. It is shown that the decrement in R(comp) is dominated by a term proportional to the square root of the noisiest transition probability, alpha, to a nominally noiseless output. In contrast, the decrement in C in many cases of interest is dominated by a term proportional to -(alpha)ln(alpha). Accordingly the decrement in R(comp) can significantly exceed the decrement in C. This paper was presented at the 1979 IEEE International Symposium on Information Theory held in Grignano, Italy on 25-29 June 1979. GRA

HC A05/MF A01 CSCL 17/9

A comprehensive analyses of all radio-star calibration measurements made since May 1975 with the Millstone Hill Tracking Antenna is described. No evidence is found to indicate that mechanical offsets in the antenna structure have changed during this period. Previous suspicions that such changes might be continually occurring are shown to have arisen from acute mathematical correlation ambiguities encountered in fitting models to the monthly results. In addition, it is found that the high

stability of the LED-type encoders installed in November 1977 has virtually eliminated this last source long-term variation in pointing offset. Only known mechanical modifications, causing discrete changes in pointing error model, have caused the pointing-error model to change since this date. Calibration of the octagonal rail/cam-follower system used by the Tracking Antennas as an off-axis azimuth encoder system is also investigated. Evidence is presented that the primary pointing errors that arise from inaccuracies in this system are due to an offset between the azimuth axis and the geometric center of the rail octagon, an ellipticity of the tower perimeter upon which the rails are mounted, and a slight bowing of the rails, the center offset being an estimated 0.3 mm, the rail geometry being 0.05 mm out of round, and the rails being bowed a maximum of 0.02 mm from straightness. These deficiencies cause pointing errors on the order of 10 mdeg. GRA

HC A03/MF A01 CSCL 17B

The current state-of-the-art in techniques for reducing the bandwidth needed to represent the human voice waveform is reviewed. If techniques exist for significantly reducing the 3 KHz bandwidth while maintaining sufficient quality, the radio frequency bandwidth could be proportionately reduced. The status of speech baseband compression is still in the laboratory stage or just emerging. None of it has been applied in any large commercial operation. Technology is available for reducing the 3 KHz voice bandwidth by a factor of 10, but at this stage this technology is not useful because a desirable level of performance and cost have not been achieved. The basic conclusion is that techniques currently available for significantly reducing speech bandwidth produce a concomitant degradation in speech quality. GRA

LUMP PARTITIONING OF INTEGRATED-CIRCUIT BIPOLAR TRANSISTOR MODELS FOR HIGH-FREQUENCY APPLICATIONS Ph.D. Thesis
Nelson Nai-Hin Chan. 1979. 214 p.
Avail: Univ. Microfilms. Order No. 8006299

A two lump high frequency model was derived using the lump partitioning technique for an integrated bipolar transistor over a frequency range up to f sub T and a full current range. Excellent agreement between model and measured S parameters was obtained for the Stanford Bipolar Transistors with an f sub T of 500 MHz. A physical basis was provided for the two lump model. There are two major physical mechanisms responsible for the high frequency behavior of the integrated bipolar transistors. For low currents it is the AC crowding effect which causes more current flow in the periphery of the emitter area than in the center. For high currents it is the sidewall transistor action which induces a significant amount of minority charge that controls the high frequency response of the device. The combination of these two effects provide a guide to partition the one lump model into two sections, one section with most of the ac response and the other section with only dc response. Dissert. Abstr.

METAL-INSULATOR-SEMICONDUCTOR ASPECTS OF MONOLITHIC ZINC OXIDE SURFACE ACOUSTIC WAVE STRUCTURES Ph.D. Thesis
Michael Edwin Cornell 1979 270 p
Avail: Univ. Microfilms Order No. 8005849

The nonideal electrical behavior of the metal ZnO SiO2 Si(MZOS) configuration constitutes an important factor in the performance of monolithic ZnO SAW devices. The observations described herein emphasize the use of MIS measurements to study the electrical properties of the MZOS system. The major areas of investigation involved process induced damage to the Si-SiO2 subsystem and electronic charge injection/trapping within the ZnO films. A procedure whereby the charge distribution is established as a quasi time independent distribution is described. Comparison studies of the C-V characteristics of the MZOS-C and Si-SiO2 system, a ZnO etch back experiment, and capacitance time observation of the change injection phenomena are examined. A model is advanced based upon the physical nature of the piezoelectric ZnO films to explain charge injection and the dipole formation within the ZnO film. Dissert. Abstr.

THEORY AND APPLICATIONS OF NEGATIVE DIFFERENTIAL RESISTANCE IN THE CURRENT-VOLTAGE CHARACTERISTICS OF METAL-INSULATOR-METAL DIODES Ph.D. Thesis
David M. Drury 1978 171 p
Avail: Univ. Microfilms Order No. 8006526

The negative differential resistance phenomenon that has been observed in the current-voltage characteristics of some MIM diodes was investigated theoretically. Deficiencies of the present theory purporting to explain this phenomenon were pointed out. A theory was developed to explain the observed negative differential resistance. According to this theory, if the diode bias voltage is sufficiently large, an electron can tunnel inelastically through the insulating layer of the diode by emitting a surface plasmon that propagates in the insulating layer. The mathematical analysis of the proposed stimulated inelastic tunneling theory was performed using an idealized two dimensional model of an MIM diode. The electric and magnetic field distributions of the surface plasma wave in the diode's insulating layer were derived and used to obtain the interaction Hamiltonian of the tunneling electrons. Second order time-dependent perturbation theory was used to obtain the stimulated inelastic tunneling rate. An equation relating the inelastic tunneling current to the bias voltage was obtained. Dissert. Abstr.

AN ACQUISITION AID FOR A PHASE LOCKED LOOP Ph.D. Thesis
Donald Richard Ucci 1979 286 p
Avail: Univ. Microfilms Order No. 8006478

A method for acquisition of a phase lock loop receiver is presented. A structure designed for this purpose is described. The method uses an iterative technique to estimate the frequency of an unknown Doppler shifted unmodulated carrier signal imbedded in noise. The acquisition process can be achieved even if the system is below threshold. The acquisition times for a given probability of error are presented for two modes of operation - one which provides a reduced acquisition time but requires more hardware complexity, and another which produces slightly less reduced acquisition times but a simpler hardware design. Results for a hardware implementation are presented. Dissert. Abstr.

PLACEMENT AND ROUTING ALGORITHMS FOR HIERARCHICAL INTEGRATED CIRCUIT LAYOUT Ph.D. Thesis
Bryan Thomas Preas 1979 210 p
Avail: Univ. Microfilms Order No. 8006344

Algorithms for the automatic layout of custom integrated circuits were developed. These algorithms are suitable for the design of very large scale integrated circuits. Hierarchical decomposition is used to reduce the circuit complexity to the level that it can be comprehended by the designer. At each level of the hierarchy, the layout problem consists of the placement and interconnection of rectangular blocks of arbitrary size and shape. The layout is modelled using graph theoretical methods. The problem is broken down into two major sub-problems, placement and routing. Placement consists of a constructive initial placement followed by iterative improvement. The interconnection or routing process first finds a general layout topology for the interconnection nets and then a detailed routing using constructive and iterative improvement methods. The algorithm minimizes layout area and assures 100% routing completion. Dissert. Abstr.

An electricity producing cell of the reduction-oxidation (REDOX) type is described. The cell is divided into two compartments by a membrane, each compartment containing a solid inert electrode. A ferrous/ferric couple in a chloride solution serves as a cathode fluid which is circulated through one of the compartments to produce a positive electric potential disposed therein. A chromic/chromous couple in a chloride solution serves as an anode fluid which is circulated through the second compartment to produce a negative potential on an electrode disposed therein. The electrode is an electrically conductive, inert material plated with copper, silver or gold. A thin layer of lead plates onto the copper, silver or gold layer when the cell is being charged, the lead ions being available from lead chloride which was added to the anode fluid. If the REDOX cell is then discharged, the current flows between the electrodes causing the lead to deplate from the negative electrode and the metal coating on the electrode will act as a catalyst to cause increased current density. (AD-A078008; RADC-TR-79-255) Avail: NTIS HC A04/MF A01 CSCL 09/3

A stripline technique for the measurement of longitudinal and transverse conductivity of graphite (carbon)/epoxy composite materials over the VHF/UHF (75 MHz to 2.0 GHz) range is described. The method is unusual in that it is essentially free of the uncertain effects of contact resistance between the sample and the measurement apparatus. The underlying theory of the method rests on the relationship between the conductivity of the sample and the lossy standing wave patterns established on the strip transmission line. The method accommodates a range

of sample conductivities from 100 mhos/m. (e.g. transverse carbon/epoxy) to aluminum (approx. 10 to the 7th power mhos/m). Actual measurements were made from 75 MHz to 2 GHz. The method itself should be usable from 50 MHz to 4 GHz. GRA

THERMISTOR ARRAY IMPEDANCE CONSIDERATIONS
Clifford R. Holland Jun. 1978 17 p refs
(AD-A079886; NORDA-TN-26) Avail: NTIS
HC A02/MF A01 CSCL 09/1

This study examines the effects of cable resistance changes on temperature measurement accuracy when using a typical thermistor array for ocean temperature measurements. The analysis demonstrates that while some of the effects can be calculated or calibrated out, the major effects of insulation leakage can not be so corrected. Depending on choice of thermistor, measurement errors as large as a few deg Celsius are possible, with errors of a few tenths of a deg Celsius likely. Even with great care, errors of a few hundredths of a degree Celsius are probable. To avoid sensitivity to cable impedance changes, it is strongly recommended that appropriate signal conditioning electronics be utilized at the thermistor sensor. The use of signal conversion and line driving electronics will insure that the accuracy of measured parameters will be maximally preserved during transmission to the output end of the array. GRA

Planar single crystal layers of GaN that are almost defect free and completely transparent can now be grown routinely by CVD on basal plane sapphire substrates. The native shallow donor density still remains high (ten to the 18th power - ten to the 19th power/cc) unaltered by growth under varying Ga:N ratios, but decreasing somewhat with increased growth rate. The results of growth under N2 at high pressures are inconclusive at present. Doping with Ge or C during growth does not compensate the donor. Low temperature photoluminescence studies of proton implanted samples and of samples grown in the absence of H2 provide additional evidence that the shallow donor is not associated with H. Work is in progress to interpret much fine structure observed in the luminescence spectra, to complete the identification and characterization of donors and acceptors introduced by ion implantation and to observe any effects on the native donor density caused by the implantation of Ga and of N. The object of this work was to study ion implantation in perovskite ferroelectrics and to investigate the conductive behavior of implanted layers. Implantation experiments were carried out on strontium titanate, barium titanate (single crystal and ceramic), titanium dioxide (rutile), lithium niobate, and lithium tantalate. Ion beams attempted were H(+), B(+), Cl(+), Ni(+), Fe(+), Ar(+), As(+), Ta(+), and Nb(+). In general the most effective ion in producing conductivity was boron, B(+). Significant conductivity was measured in the substrates above, except for single crystals of barium titanate and lithium tantalate. Boron implanted in strontium titanate and subsequently annealed resulted in highly conductive layers, whose sheet resistance could be between 100 and 100,000 ohm per square. The charge carrier mobility in this system was 5 sq. cm/volt sec at room temperature, increasing to 100 sq. cm/volt sec at 77 K. Implantation doses were 10 to the 16th power to 10 to the 17th power ions/sq. cm. The implantation depth, as revealed by chemical stripping experiments, was about 500 nm. A conductive anomaly was measured in some samples at 105 K, the cubic-tetragonal transition temperature. GRA

The overall objective of the GaAs RF-LSI Development Program is the development of a family of monolithic GaAs analog integrated circuits operating at frequencies through X-band, and the implementation of a monolithic X-band receiver which combines a number of these building block circuits. The aim of the first phase effort was to amass the analysis, design, and process technology tools with which to implement the building block circuits and later the receiver. The general objective of Phase 1, Device, Process and Circuit Techniques Investigation, was to undertake the device and process technology development necessary to support the Phase 2, MSI Building Block Development. Closely coupled with the actual process development were theoretical studies addressing optimization of devices and circuit techniques for monolithic implementation. The following is a brief task by task summary of the work accomplished. The sections which follow this introduction are expanded discussions of each of the tasks. GRA

ON THE PHYSICAL REALIZABILITY OF BROAD-BAND EQUIVALENT CIRCUITS FOR WIRE LOOP AND DIPOLE ANTENNAS Interim Report, 1 Sep. 1977 - 31 May 1979
Gary W. Streable and L. Wilson Pearson May 1979 163 p refs
(Grant AF-AFOSR-3452-77; AF Proj. 2301)
(AD-A079961; RR-79-1; AFOSR-80-0003TR) Avail: NTIS HC A08/MF A01 CSCL 20/14

Results of a study of the feasibility of using Singularity Expansion Method (SEM) data to synthesize broad-band equivalent circuits for loop and wire structures are reported. The positive realness of admittances derived are studied, on the basis of both pole-pair groupings and eigenmode groups within the SEM formalism. Synthesized circuits are given for a center-driven and a quarter-driven straight wire antenna, and for a circular loop. Results are compared with those derived by means of numerical solution of the time-dependent integral equations for each structure. The sensitivities of the response to changes in the values of poles and to circuit element values are considered. GRA

ON THE PHYSICAL REALIZABILITY OF BROADBAND LUMPED-PARAMETER EQUIVALENT CIRCUITS FOR ENERGY-COLLECTING STRUCTURES Final Report
L. Wilson Pearson (Mississippi Univ., University) and Donald R. Wilton Jul. 1979 44 p refs
(Grant AF-AFOSR-3452-77)
(AD-A079962; RR-79-2; AFOSR-80-0004TR) Avail: NTIS HC A03/MF A01 CSCL 20/14

The practical implementation of equivalent circuits which represent the energy delivered to an arbitrary load impedance by an antenna or a port on a scatterer is discussed. Particular attention is paid to the positive-real function issues associated with the equivalent admittance of the structure when evolved from the point of view of the Singularity Expansion Method. A proof is given which establishes that the admittances associated with current eigenmode contributions to the total current are individually positive-real functions. An ad hoc approach to approximating these admittances with simpler pole-pair positive-real admittances is given for high-Q structures. A brief survey of the applicable circuit synthesis algorithms and their features is provided. Some fundamental considerations in the implementation of the sources representing the energy coupled from the incident wave are presented. GRA

FABRICATION, CHARACTERIZATION AND OPTIMIZATION OF POSFET (PVF2-SILICON) PIEZOELECTRIC TRANSDUCERS FOR LOW FREQUENCY 100 Hz TO 500 KHz UNDERWATER ACOUSTIC APPLICATIONS Final Report, 1 Jul. 1978 - 31 Aug. 1979
James D. Plummer Oct. 1979 90 p refs
(Contract N00014-78-C-0614)
(AD-A079113; TR-FR-DPG582) Avail: NTIS HC A05/MF A01 CSCL 17/1

PVF2 is a new organic polymer piezoelectric material. Its unique features include an acoustic impedance closely matched to liquid environments, linearity to a broad range of input signals, wide bandwidth and mechanical strength and flexibility. In comparison with commonly used ceramic piezoelectric materials, PVF2 has a lower electromechanical coupling coefficient, a lower dielectric constant and higher dielectric losses at frequencies greater than or equal to 500 KHz. Because of these different material properties, system applications of PVF2 require different trade-offs than the ceramic materials. This report describes an investigation, both theoretical and experimental, of the potential applications of PVF2 in low frequency (100 Hz-500 KHz) underwater sound applications. Both reception and transmission of sound are considered and the experimental performance of several types of PVF2 and integrated silicon/PVF2 transducers are described. GRA

INFLUENCE OF MAGNETIC ORDERING ON THE SUPERCONDUCTING PROPERTIES OF AMORPHOUS (Zr/SUB 1-X/Er/SUB X/)3Rh ALLOYS
W. L. Johnson Aug. 1979 21 p refs
(Contract EY-76-C-03-0822)
(CALT-822-110; DOE-TR-97) Avail: NTIS HC A02/MF A01

The effect of Er impurities on the superconducting properties of an amorphous Zr3Rh alloy was studied. The Er impurities were foundt o exhibit mangnetic behavior characteristic of a free Er(3+) ion in a weak crystal field. Magnetic ordering of the Er moments was observed to occur at a temperature T/sub M/ which is proportional to the Er concentration. This ordering strongly influenced superconductivity as evidenced by anomalous behavior in the concentration dependence of T/sub c/. For concentrations near the critical Abrikosov-Gorkov value superconductivity appeared to be induced by magnetic ordering. The superconducting critical field H/sub c2/(T) was strongly effected by magnetic ordering and could be used to deduce information concerning the nature of the ordering. The results are analyzed in terms of theoretical models. DOE

PRODUCTION OF THIN FILM NETWORKS WHICH UTILIZE CHROME-GOLD CONDUCTORS
D. A. Rathbun Jul. 1979 8 p Presented at the ISHM Conf., Los Angeles, 13 Nov. 1979
(Contract EY-76-C-04-0613)
(BDX-613-2257; CONF-791113-3) Avail: NTIS HC A02/MF A01

Many thin film networks (TFNs), designed and manufactured for DOE programs utilize gold films 3 to 9 microns thick evaporated over a chromium film. The chromium film is evaporated over sputtered tantalum nitride film, and the substrate material is 0.027 in. (0.686 mm) thick alumina. The TFNs must have high film adhesion characteristics, meet high bondability requirements, and allow stable electrical parameters. Various production techniques ensure these high reliability TFNs. DETERMINING THE MODE OF HIGH VOLTAGE BREAKDOWNS IN VACUUM DEVICES
H. C. Miller, E. J. Furno, and J. P. Sturtz 1979 22 p refs
(Contract EY-76-C-04-0656)
(GEPP-OP-469) Avail: NTIS HC A02/MF A01

Photography, recording of the voltage waveform, and monitoring of the X-ray output were used to investigate breakdown in vacuum. Results indicate that breakdowns may be divided into two types: vacuum (interelectrode) breakdown - characterized by a diffuse moderately bright discharge, a relatively slow and smooth voltage collapse and a large burst of X-rays; and surface (insulator) flashover - characterized by a bright discharge with a very bright filamentary core, a relatively fast and noisy voltage collapse, and no X-ray burst. Thus, the results indicate that useful information concerning the type of breakdown in a vacuum device can be obtained by monitoring the voltage (current) waveforms and the X-ray output. DOE

MULTIPLE PROPERTY VARIATIONS IN COAXIAL CYLINDRICAL CONDUCTORS DETERMINED WITH MULTIPLE-FREQUENCY EDDY CURRENTS
W. E. Deeds and C. V. Dodds Nov. 1979 63 p refs
(Contract W-7405-eng-26)
(NUREG-CR-0967; ORNL/NUREG/TM-335) Avail: NTIS HC A04/MF A01

To expedite and automate the taking of readings, computer programs were written that take simultaneous measurements of the magnitude and phase of the output voltage from an eddy current pickup at several different frequencies on standards with known properties. Empirical formulas are then constructed from powers of various possible functions of the magnitude and phase readings, and the formulas are fitted to the desired properties of the material by a least-squares process. Finally, the empirical formulas are used with readings on unknown samples to determine their properties. The computer programs, written in FORTRAN, are especially designed to be used with coils coaxial with multiple layers of cylindrical conductors, possibly containing defects. However, the instrument calibrating, data taking, and formula fitting parts of the programs are actually applicable to any configuration of coils and conductors. DOE

MEASUREMENT TECHNIQUES FOR HIGH POWER SEMICONDUCTOR MATERIALS AND DEVICES Annual Report, 1 Oct. 1977 - 30 Sep. 1978
Oct. 1979 144 p refs
(DOE/RA-0041; NBSIR-79-1756) Avail: NTIS HC A07/MF A01

Results of research directed toward the development of measurement methods for semiconductor materials and devices which will lead to more effective use of high-power semiconductor devices in applications for energy generation, transmission, conversion, and conservation are reported. Emphasis is on the development of measurement methods for materials for thyristors and rectifier diodes. The use of thermally stimulated current and capacitance measurements and other deep level measurement techniques developed as a means for characterizing lifetime-controlling or leakage source defects in power grade silicon material and devices are described. Procedures to enable spreading resistance measurements of thyristor starting material and layer profiles to be made on a reliable basis are included. DOE

SUPERCONDUCTING FAULT CURRENT LIMITER Quarterly Technical Progress Report, 8 Aug. - 7 Nov. 1978
1979 104 p refs
(Contract ET-78-C-01-3015)
(CONS/3015-T1; QTPR-1) Avail: NTIS HC A06/MF A01

The suitability of using a superconducting fault current limiter (SCFCL) in conjunction with other superconducting apparatus or transmission lines was investigated. Literature search, consultation, analysis, and experimentation were carried out to derive a set of operational parameters for a SCFCL and to answer key questions as to the feasibility of a superconducting element to meet these performance objectives. Substantial progress was made on several of these program tasks. A comprehensive search of the literature on SCFCL devices and applications was initiated; the references which were obtained to date are evaluated within a framework into which additional references can be added as they are received. Device analyses were also started in order to determine to what extent the various proposed SCFCL devices meet the requirements of the power system. DOE

MICROSTRUCTURAL STUDIES OF THICK FILM RESISTORS USING TRANSMISSION ELECTRON MICROSCOPY
T. V. Nordstrom and C. R. Hills 1979 14 p refs Presented at the ISHM Conf., Los Angeles, 13 Nov. 1979
(Contract EY-76-C-04-0789)
(SAND-79-0387C; CONF-791113-4) Avail: NTIS HC A02/MF A01

The microstructure of thick film resistors of the DuPont 1400 series fired on 96% Al2O3 at 850 C was characterized using transmission electron microscopy. Samples were prepared by a combination of precision grinding and ion milling. Each sample was examined for crystallinity, phase morphology, particle size, elemental composition and phase identification. X-ray energy dispersive spectroscopy was used for elemental composition determination and electron diffraction for phase identification. Microstructure of the 1421 (100 omega/square) material is composed of lead ruthenate crystals in a lead silicate glass along with quartz crystals. For both resistors most crystallites are surrounded by the glassy phase. DOE

N80-20509# National Bureau of Standards, Washington, D.C. National Engineering Lab.
A 20 BIT PLUS SIGN, RELAY SWITCHED D/A CONVERTER
T. Michael Souders and Donald R. Flach Oct. 1979 25 p refs
(PB80-105331; NBS-TN-1105) Avail: NTIS HC A02/MF A01 CSCL 09E

A multirange, 20-bit + sign, voltage output d/a converter is described. The converter exhibits less than 1 ppm (of full scale range) linearly error, and temperature coefficients of gain, offset and linearly of less than 0.5 ppm/C. The design is based on the R-2R ladder network in the current steering mode, using miniature latching relays with mercury wetted contacts for switching. There are ten buffered temperature controlled unsaturated standard cells which comprise the voltage reference. Techniques with design details are presented for minimizing errors due to relay thermal emf's, for implementing a self calibration of linearity errors, and for obtaining optional coding formats. Calibration techniques are discussed and representative calibration data are presented. GRA

DYNAMICS OF FLEXIBLE ROTORS PARTIALLY FILLED WITH A VISCOUS INCOMPRESSIBLE FLUID Ph.D. Thesis
Scott Lynn Hendricks 1979 125 p
Avail: Univ. Microfilms Order No. 8004603

A linear theory is developed to study the motion of a hollow circular cylinder rotating with constant angular velocity and partially filled with a viscous incompressible fluid. A two-dimensional theory which ignores axial motion in the fluid is discussed. This theory exhibits all of the essential features of liquid-rotor coupling and is used to analyze a simple rotor configuration, and explore the ramifications of the analysis. The full three dimensional theory is then developed and used to analyze more complicated rotors. The results of the analysis predict that over a range of operating speeds, the rotor-fluid system is unstable. The extent of this unstable region is determined by the system parameters. The interplay between the viscosity of the fluid and damping on the rotor is especially important in determining stability boundaries. Dissert. Abstr.

SOLUTION OF THE EQUATIONS OF CONVECTIVE HEAT, MASS, AND MOMENTUM TRANSFER BY THE FINITE-ELEMENT METHOD USING QUADRILATERAL ELEMENTS Ph.D. Thesis
Satish Ramadhyani 1979 196 p
Avail: Univ. Microfilms Order No. 8006668

A finite element procedure was developed that overcomes the Reynolds number limitation. The procedure involved the use of the weighted residual technique with a special shape function that accounted or the influence of the convective terms in the governing conservation equations. The procedure was developed in detail for two dimensional flow situations, but the ease of extension to three dimensional flow situations was a significant consideration in its development. This has dictated the use of quadrilateral elements rather than the otherwise simpler triangular elements, since the three dimensional counterpart of a quadrilateral was hexahedron. Hexahedral blocks were employed to fill an arbitrary three dimensional domain more easily than did tetrahedra. Dissert. Abstr.

FLUID FLOW THROUGH A PARTIALLY FILLED CYLINDER Ph.D. Thesis
Raymond Nicholas Greenwell 1979 90 p
Avail: Univ. Microfilms Order No. 8006121

The laminar flow of viscous incompressible fluid through a partially filled circular cylinder is studied. For this problem the Navier-Stokes equations can be transformed into Laplace's equation, and the region of solution is the interior of two intersecting circles. The region is mapped to the unit circle by a conformal transformation, so that the problem may be solved by the Poisson integral formula. It is found that the flow rate can be increased by as much as 27.3% by not filling the cylinder all the way. For the case where the region of solution is the interior of two circles intersecting at right angles, the computations simplify and the integration can be performed analytically. For the case of the nearly-half filled cylinder, a perturbation method is used on the solution of the half filled circular cylinder. The results obtained from these special cases agree with the previously obtained results. Dissert. Abstr.

N80-20517 Minnesota Univ., Minneapolis.
NONGEOSTROPHIC BAROCLINIC INSTABILITY OF TWO FLUIDS Ph.D. Thesis
James Theodore Bradford 1979 197 p
Avail: Univ. Microfilms Order No. 8006588

The interfacial stability of two fluids under differential rotation in a tall, right circular cylinder was investigated. The differential speeds are such that the Rossby number of the flow is small. Geostrophic conditions prevail in the interior, undisturbed flow and the results of interfacial shape calculations using the geostrophic velocity profiles in each fluid are compared with experimentally measured interface shapes. A linearized stability analysis, including interfacial tension and viscous effects at the interface and end caps was performed on the nongeostrophic equations of motion. Experiments were conducted in which instability regions corresponding to the wave numbers $n = 1$ and $n = 2$ are determined. Qualitative observations are made concerning the presence of amplitude and frequency vacillations characteristic of finite amplitude baroclinic waves under supercritical conditions. Dissert. Abstr.

N80-20518 Purdue Univ., Lafayette, Ind.
LABORATORY STUDY OF THERMAL AND FLOW STRUCTURES IN HEATED AND/OR COOLED LAYERS OF WATER Ph.D. Thesis
Massoud Behnia 1979 235 p
Avail: Univ. Microfilms Order No. 8005833

The basic internal transport processes in natural waters and the interactions at the air-water interface was investigated. To this end, thermal and flow structure in a stratified layer of water heated by a radiation source and/or cooled by forced air flow over the surface was studied in the laboratory. Accurate temperature measurements were obtained using a Mach-Zehnder interferometer which did not disturb or distort the temperature, radiation and flow fields. The flow structure was studied qualitatively by visualizing the patterns with dye injection, particle tracing (fish scales) and shadowgraph techniques. Temperature fluctuations and thermal plume activities were detected by a thermistor. Dissert. Abstr.

CAVITATION INDUCED INSTABILITIES ASSOCIATED WITH TURBOMACHINES Ph.D. Thesis
David Miner Braisted 1980 196 p
Avail: Univ. Microfilms Order No. 8006277

A linear stability analysis was developed which was based upon the understanding that auto-oscillation is a function of the entire hydraulic system including the cavitating inducer. Using the experimentally obtained transfer functions of two impellers, the analysis successfully predicted both the onset and frequency of auto-oscillation. The stability of the dynamic pump test facility is significantly reduced by the increased dynamically active character of the inducers at the lower cavitation number. In addition, the stability of the dynamic pump test facility was found to be particularly sensitive to the mass flow gain factor and pump impedance. Dissert. Abstr.

N80-20520 Virginia Polytechnic Inst. and State Univ., Blacksburg.
THE DYNAMICS OF AN ULTRASONIC CAVITATION BUBBLE Ph.D. Thesis
Chinenyenwa Okereke 1979 175 p
Avail: Univ. Microfilms Order No. 8005225

The dynamics of the bubble are represented by a problem in partial differential equations, the governing equations of which are the continuity equation and the Navier-Stokes equation for a compressible liquid. A finite difference scheme was developed for generating the exact solution of the problem. It was not possible to obtain a solution that would satisfy both the governing equations and all the boundary conditions. The problem has more boundary conditions in pressure than can be satisfied. Consequently, it is not a valid mathematical statement and is not a legitimate representation of the dynamic behavior of the cavitation bubble. Dissert. Abstr.

N80-20521 Minnesota Univ., Minneapolis.
DEVELOPMENT AND APPLICATIONS OF A LAMELLAR MODEL FOR ANALYSIS OF LIQUID-LIQUID MIXING Ph.D. Thesis
Julio Mario Ottino 1979 230 p
Avail: Univ. Microfilms Order No. 8006659

Mixing, a process that involves fluid mechanics, diffusion, and chemical reactions is analyzed. In general, these three mechanisms govern reaction in any reacting mixture. These mechanisms are integrated in a common frame of description. Analysis is divided in two parts: a continuum description of the mechanical mixing of fluids (with neither diffusion nor reaction) and a lamellar mixing model for mixing of diffusing and reacting fluids. Mechanical mixing of fluids is interpreted as deformation of contact interfaces or material surfaces and is described by continuum mechanical arguments. Mixing of diffusion and reacting fluids is interpreted in terms of a lamellar model. This is a continuum, deterministic description based on a Lagrangian point of view for computation of interactions between local fluid motion, diffusion, and chemical reaction. The attributes of each model are delineated. Dissert. Abstr.

N80-20522 Purdue Univ., Lafayette, Ind.
A CONTRIBUTION TO THE STABILITY OF ELECTRICALLY CONDUCTING BOUSSINESQ FLUIDS BY THE ENERGY METHOD Ph.D. Thesis
Alan Morris Greenburg 1979 100 p
Avail: Univ. Microfilms Order No. 8005885

The energy method of Reynolds and Orr, for flows subject to finite disturbances, is extended to include approximate base flows and flows in which inertial and/or Lorentz forces of the base flow are of comparable or greater magnitude than the impressed body force field. The extension given is consistent with the well-known Boussinesq approximation. Two new stability criteria were established which demonstrate the effect of allowing approximate base flows. The universal stability boundary considers only the extremal characteristics of the base flow. The optimal stability boundary criteria applies variational techniques and utilizes more details of the base flow to obtain the largest possible stability region consistent with the theory. The theory is applied to the problem of heated Couette flow, both with and without internal viscous heating. Dissert. Abstr.

N80-20523 Stanford Univ., Calif.
EVOLUTION OF TURBULENCE BY THREE-DIMENSIONAL NUMERICAL PARTICLE-VORTEX TRACING Ph.D. Thesis
Benoit Couet 1979 145 p
Avail: Univ. Microfilms Order No. 8006306

A method for the numerical simulation of three dimensional incompressible flows is described which traces the motion of the vortex filaments in the velocity field which these filaments create. Three computational experiments were pursued in three dimensional space. The velocity of translation of a single vortex ring was measured and compared with the Biot-Savart law. The agreement was excellent. Next, the evolution in time of an infinite periodic array of closed vortex filaments was studied. The results were compared with those obtained previously by the spectral method. The Fourier mode spectra were in very good agreement. The third simulation followed a mixing layer from an initial state of uniform vorticity with two and three dimensional small perturbations. Streamwise perturbations lead to the usual roll-up of vortex patterns with spanwise uniformity. Substantial streamwise vortex deformation and stretching is generated by the spanwise perturbations. Dissert. Abstr.

N80-20524 Stanford Univ., Calif.
KINEMATICS AND DYNAMICS OF VORTEX RINGS IN A TUBE Ph.D. Thesis
James Gordon Brasseur 1979 228 p
Avail: Univ. Microfilms Order No. 8006294

Kinematic theory and flow visualization experiments are combined to examine the dynamic processes which control the evolution of vortex rings from very low to very high Reynolds numbers, and assess the effects of the wall as a vortex ring travels up a tube. The vortex ring are modeled as a circular vortex filament axisymmetrically placed in an infinitely long tube. Using the Biot-Savart law, a kinematic expression which linearly relates a given distribution of vorticity to its velocity field, the closed form solutions to the nonsteady potential and streamline fields are obtained. Reynolds number relationships are established and quantitative differences among the three Reynolds number groups are discussed. Dissert. Abstr.

N80-20525 Oregon State Univ., Corvallis.
GAS FLOW IN FLUIDIZED BEDS OF LARGE PARTICLES: EXPERIMENT AND THEORY Ph.D. Thesis
Goran N. Jovanovic 1979 166 p
Avail: Univ. Microfilms Order No. 8007123

Gas mixing was studied in a fluidized bed which is 0.483 m by 0.127 m (19 in. by 5 in) in cross section and has transparent plexiglass panels on the front and back. Experiments were conducted in a bed with and without tube array. Sand and dolomite particles with mean particle diameter of 1.3 mm (0.051 in.) to 4.0 mm (0.157 in.) were used. Gas velocities varied from minimum fluidization velocity to an excess velocity of 2.5 m/s. Two large particle fluidization regimes are described and experimental evidence is presented in support of the existence of slow bubble and exploding bubble regimes. A semi-theoretical equation establishing the boundary between these two modes of fluidization is derived. A new model, called the meandering flow model, is proposed for gas flow through fluidized beds of large particles. The concept of meandering flow is developed on the basis of actual physical movements of gas. Dissert. Abstr.

N80-20526 Virginia Polytechnic Inst. and State Univ., Blacksburg.
PULSATILE LAMINAR FLOW SEPARATION IN AN EXPONENTIALLY DIVERGING TUBE Ph.D. Thesis
Frederick James Walburn 1979 142 p
Avail: Univ. Microfilms Order No. 8005230

A laser Doppler anemometer technique was developed and used to study steady and unsteady flow through rigid circular tubes. An experimental arrangement was presented which includes a design which significantly reduced beam refraction effects as the laser beams pass through the circular glass tube. A Tektronix 4051 data acquisition system was used to acquire the data, process it and display non-dimensional axial velocity profiles on a digital plotter. It was found in steady flow through a diverging circular channel that a threshold Reynolds number existed for which the flow separated initially at the furthest downstream end of the channel divergence. With increasing Reynolds number above threshold, the point of flow separation defined by Prandtl's criterion moved upstream, such that for any given axial location x sub i, there corresponded a characteristic Reynolds number at which the flow was completely separated downstream of x sub i. Upstream, the flow remained laminar and attached. Dissert. Abstr.

PROGRESS IN TURBULENCE MODELING FOR COMPLEX FLOW FIELDS INCLUDING EFFECTS OF COMPRESSIBILITY
David C. Wilcox (DCW Industries, Inc., Studio City, Calif.) and Morris W. Rubesin Washington Apr. 1980 73 p refs
(NASA-TP-1517; A-7916) Avail: NTIS HC A04/MF A01 CSCL 20D

Two second-order-closure turbulence models were devised that are suitable for predicting properties of complex turbulent flow fields in both incompressible and compressible fluids. One model is of the 'two-equation' variety in which closure is accomplished by introducing an eddy viscosity which depends on both a turbulent mixing energy and a dissipation rate per unit energy, that is, a specific dissipation rate. The other model is a 'Reynolds stress equation' (RSE) formulation in which all components of the Reynolds stress tensor and turbulent heat-flux vector are computed directly and are scaled by the specific dissipation rate. Computations based on these models are compared with measurements for the following flow fields: (a) low speed, high Reynolds number channel flows with plane strain or uniform shear; (b) equilibrium turbulent boundary layers with and without pressure gradients or effects of compressibility; and (c) flow over a convex surface with and without a pressure gradient. A.R.H.

COMPLETE SUPERSONIC FLOWFIELDS OVER BLUNT BODIES IN A GENERALIZED ORTHOGONAL COORDINATE SYSTEM Final Report
Peter A. Gnoffo 17 Sep. 1979 45 p refs Backup document for AIAA Synoptic scheduled for publication in AIAA Journal, May 1980
(NASA-TM-81784; Log-J11338) Avail: NTIS HC A03/MF A01 CSCL 20D

A general orthogonal coordinate system is used to describe various axisymmetric and two-dimensional shapes. Close approximations to planetary probe configurations are possible. The full Navier-Stokes equations are discretized in this coordinate system in a manner based on Allen and Cheng's numerical procedure. The blow shock is treated as a discontinuity which floats between grid points. Completely coupled flows over the forebody, base, and near wake were calculated over a cylinder, sphere, and an approximation to the Viking Aeroshell. Some problem areas in determining the base flow for increasing Reynolds number are discussed. In particular, it is found that the mean free path of the fluid near the wall immediately below the corner of the Viking Aeroshell, which experiences a severe expansion, can becume greater than the local mesh size required to resolve the boundary layer in the forebody. DETERMINATION OF FORCES ON ARBITRARY CONCAVE BODIES IN HIGH SPEED RAREFIED GASES
C. R. Wimberly 4 Dec. 1979 32 p refs Backup document for AIAA Synoptic scheduled for publication in AIAA Journal, Sep. - Oct. 1980
(Log-J11513) Avail: NTIS HC A03/MF A01

A method is presented for representing the forces imparted to general concave surfaces in high speed rarefied gases with variable accomodation at the surface and for a wide range of molecular speed ratios. A procedure previously developed for variations in momentum transfer is also presented that allows for predictions of coefficients from the free molecule flow through the transition regime to continuum flow. In the analysis, the molecules are assumed to obey Maxwell's velocity distribution law before and after collisions, reflecting directionally in a cosine distribution. The colliding molecules are assumed to have variable accomodation at the surface, where the surface temperature is uniform. The resulting general equations are then presented and applied to some simple concave bodies. Author

CALCULATION OF OBLIQUE-SHOCK-WAVE LAMINAR-BOUNDARY-LAYER INTERACTION ON A FLAT PLATE Final Report
Uriel Goldberg and Eli Reshotko Mar. 1980 87 p refs Prepared in cooperation with Case Western Reserve Univ., Cleveland
(Grant NGR-36-027-064)
(NASA-CR-159829) Avail: NTIS HC A05/MF A01 CSCL 20D

A finite difference solution to the problem of the interaction between an impinging oblique shock wave and the laminar boundary layer on a flat plate is presented. The boundary layer equations coupled with the Prandtl-Meyer relation for the external flow are used to calculate the flow field. A method for the calculation of the separated flow region is presented and discussed. Comparisons between this theory and the experimental results of other investigators show fairly good agreement. Results are presented for the case of a cooled wall with an oncoming flow at Mach number 2.0 without and with suction. The results show that a small amount of suction greatly reduces the extent of the separated region in the vicinity of the shock impingement location. M.G.

FACTORS AFFECTING CLEANUP OF EXHAUST GASES FROM A PRESSURIZED, FLUIDIZED-BED COAL COMBUSTOR
R. James Rollbuhler and John A. Kobak Mar. 1980 37 p refs
(NASA-TM-81439; E-382) Avail: NTIS HC A03/MF A01 CSCL 20D

The cleanup of effluent gases from the fluidized-bed combustion of coal is examined. Testing conditions include the type and feed rate of the coal and the sulfur sorbent, the coal-sorbent ratio, the coal-combustion air ratio, the depth of the reactor fluidizing bed, and the technique used to physically remove fly ash from the reactor effluent gases. Tests reveal that the particulate loading matter in the effluent gases is a function not only of the reactor-bed surface gas velocity, but also of the type of coal being burnt and the time the bed is operating. At least 95 percent of the fly ash particules in the effluent gas are removed by using a gas-solids separator under controlled operating conditions. Gaseous pollutants in the effluent (nitrogen and sulfur oxides) are held within the proposed Federal limits by controlling the reactor operating conditions and the type and quantity of sorbent material. HOT WIRE ANEMOMETER INVESTIGATION OF TURBULENCE LEVELS AND DEVELOPMENT OF LIQUID CRYSTAL FLOW VISUALIZATION TECHNIQUES FOR THE RECTILINEAR CASCADE TEST FACILITY M.S. Thesis
William R. Miller Sep. 1979 63 p refs
(AD-A078284) Avail: NTIS HC A04/MF A01 CSCL 20/4

Using hot wire anemometry, a base line turbulence intensity level was determined for the Rectilinear Cascade at the U.S. Naval Postgraduate School Turbopropulsion Laboratory. The turbulence with straight inlet guide vanes was compared to the turbulence without guide vanes. Results indicated a uniform though slightly greater turbulence level when using guide vanes. The

use of liquid crystal thermography was investigated as a technique for visualizing flow across cascade test blades. Methods of applying crystals to and resistance heating of the blade surface were investigated in bench tests. Recommendations are made which should lead to the successful application of the technique in the cascade wind tunnel. GRA

OSCILLATING FLOW ABOUT TUBE BUNDLES M.S. Thesis
Mehmet Ali Cinar Sep. 1979 122 p
(AD-A078269) Avail: NTIS HC A06/MF A01

The lift, drag, and inertia coefficients have been determined experimentally for various tube bundles and for two cylinders at various relative positions subjected to harmonically oscillating flow. The force coefficients for the inline force have been analyzed through the use of the Morison's equation and the Fourier analysis. The transverse force or the lift force has been expressed in terms of its maximum value. The results have shown that the interference between the cylinders can give rise to complex flow patterns and to unexpectedly large force transfer coefficients. The results with two cylinder experiments have shed considerable light on the wake interference in harmonic flows. GRA

DETERMINATION OF STREAMLINE GEOMETRY AND EQUIVALENT RADIUS OVER ARBITRARY BODIES WITH APPLICATION TO THREE-DIMENSIONAL DRAG PROBLEM Interim Report, 1978 - 1979
Tsze C. Tai Dec. 1979 63 p refs
(WR0230201; WR0230200)
(AD-A077878; AERO-1261; DTNSRDC-79/080) Avail: NTIS HC A04/MF A01 CSCL 20/4

An exact method has been developed for determining the streamline geometry and equivalent radius over general three dimensional bodies. This method requires knowledge of either a theoretical or experimental surface inviscid pressure distribution. The full inviscid momentum equations, written in nonorthogonal curvilinear coordinates, are reduced to a set of three first-order ordinary differential equations for determining the streamline geometry. Based on analytical relationships among coordinate variables and the streamline direction, two additional first-order equations are derived for calculating the equivalent radius. Numerical examples, which include an elliptic paraboloid and a wing-fuselage-nacelle configuration, have been considered. Calculated streamline pattern exhibits correct trend, although no comparison has been made because of lack of available data. Application of the method to three dimensional drag problems has been demonstrated. In addition to providing the correct streamline geometry for obtaining the skin friction via the axisymmetric analogue, numerical results show that the method is capable of determining the three dimensional flow separation associated with the free-vortex layer for evaluating the interference drag. This report summarized research during the period July 1, 1976 to October 1, 1979 directed to understanding turbulence in superfluid helium heat transport. This study showed, for the first time, how to create a reasonably homogeneous turbulent flow in a test section of a heat flow channel. The first systematic study of the power spectrum of turbulent fluctuations was completed. Several theoretical studies of helium 2 were also published, treating elementary excitations, temperature dependent energy levels, equations of motion and restricted geometries. GRA

A NUMERICAL STUDY OF NORMAL-SHOCK/TURBULENT BOUNDARY LAYER INTERACTIONS M.S. Thesis
Lowell C. Keel Dec. 1979 77 p refs
(AF Proj. 2307)
(AD-A079858; AFIT/GAE/AA/79D-8) Avail: NTIS HC A05/MF A01 CSCL 20/4

The hybrid finite difference code developed by MacCormack was applied to the investigation of transonic normal-shock turbulent boundary layer interactions. The computations were performed for the half plane of a symetric two dimensional duct by establishing a symmetry boundary condition at the upper boundary. Both first and second order center line boundary conditions were imposed with no measurable difference observed. A two point linear extrapolation of the primative variable was unsuccessfully attempted at the subsonic outflow boundary, but a simple zero gradient condition gave satisfactory results at four different outflow boundary positions relative to the shock wave. Numerical results (M = 1.51, 1.40 and 1.3 Re = 3,000,000 per ft) were compared with the experimental data reported by Abbiss and East. Even though the data exhibit three dimensional effects, the two dimensional computations show agreement within approximately 10%. The differences observed in the numerical-experimental comparisons were all consistent with expected three dimensional trends. Although not conclusive, the potential of adding simple three dimensional corrections to the two dimensional code shows promise for improving the experimental-numerical agreement. GRA

A CALIBRATION OF THE PRESTON TUBE IN LIQUID FLOW SYSTEMS M.S. Thesis
Brian A. Maher Dec. 1979 78 p refs
(AD-A079876; AFIT/GAE/AA/79D-10) Avail: NTIS HC A05/MF A01 CSCL 20/4

The justification of Preston tube usage is based on a universal similarity law that relates the velocity profile in fully developed pipe flow to that of a boundary layer associated with external flow. The Preston tube measures these velocities at the wall and when calibrated for flow in a pipe, provides a means of determining the local wall shear stress. This study is intended to extend the validity of this method to other working fluids such as liquids. Four separate size Preston tubes are used in three different experiments. The oil pipe provided a unique fluid in a narrow bore pipe and encompassed Reynolds numbers from just turbulent flow to 11600. Results indicated a calibration for oil that closely matched established air data. In the water tunnel experiment some difficulty was encountered for low speed flow but results above Re = 12800 precisely matched that for air. Each tube tested provided similar data and effectively proved the validity of Preston's method for water. GRA

STABILITY OF SELF-SIMILAR FLOW: UNIFORM IMPLOSION OF AN ABLATIVELY DRIVEN SHELL Interim Report
D. L. Book and Ira B. Bernstein (Yale Univ.) Dec. 1979 32 p refs
(AD-A079890; AD-E000350; NRL-MR-4132) Avail: NTIS HC A03/MF A01 CSCL 20/4

The linear stability of a uniformly imploding shell, modeled

as an ideal polytropic fluid, is investigated. Two types of unstable modes are found: incompressible irrotational perturbations localized at the outer surface, ascribable to Rayleigh-Taylor instability, and compressible modes, associated with convective instability. KIDDER'S (1976) result for the Rayleigh-Taylor modes is shown to hold independently of the form of the shell density profile. By means of a variational principle it is shown that the criterion for convective instability is the existence of a region within which the differential of p times rho to the negative gamma power in respect to r=0. Analytic solutions for both spatial and temporal dependence of the perturbations are presented, and the results applied to pellets imploded by the action of a laser or charged-particle beam. GRA

HC A07/MF A01 CSCL 20/4

The question of the stability of steady state solutions in geophysical fluid flows is addressed through qualitative analysis and quantitative examples. The inviscid linear stability theory of stratified shear flows and the solution of the stability problem using normal modes and Fourier-Laplace transforms are discussed. Two numerical examples are used to illustrate the relationship of various physical parameters to the stability of the system and to trace the development of the instability for short, intermediate and long times. The examples are (1) two layer fluid of infinite extent with application to the air-sea interface and (2) a two-layer fluid having a free surface and finite depth with application to a salt wedge estuary. The initial-value problem is solved using a power series expansion for short times, superposition of modes for intermediate times and asymptotic analysis for long times. The asymptotic expansion applicable in non-conservative systems is compared with the approximate solution using ray techniques, which are valid in conservative systems, and analytic continuation of the eigenvalues into the complex wavenumber plane. (AD-A080093; MSSU-EIRS-ASE-79-1; AFOSR-80-0083TR)
Avail: NTIS HC A04/MF A01 CSCL 20/4

Numerical solutions of the two dimensional averaged Navier-Stokes equations for the prediction of laminar, transitional, and turbulent flow fields around finite bodies of arbitrary shapes have been considered. Numerically generated body-fitted curvilinear coordinates and the relevant metric terms are used to provide the finite-difference solutions of the Navier-Stokes and the equations of turbulent quantities. Complete flow fields, including the boundary layer parameters, are obtained by using the zero, one and two-equations models for Schubauer's elliptical section, NACA663-018 airfoil, and a circular cylinder at free stream Reynolds numbers of 159,000, 1.2 and 1.4 million per foot respectively. In addition, a two-equation model with an algebraic-stress closure has also been developed. GRA

NONLINEAR WAVE PROCESS HIERARCHIES AND THE CYCLIC DEVELOPMENT OF QUASI-ORDERED STRUCTURES IN TURBULENT SHEAR FLOWS Final Report, 1 Jul. 1977 - 30 Jun. 1979
Robert Vagilio-Laurin Nov. 1979 35 p refs
(Contract F49620-77-C-0119; AF Proj. 2307)
(AD-A079619; NYU/DAS-79-18; AFOSR-79-1322TR) Avail: NTIS HC A03/MF A01 CSCL 20/4

The nonlinear wave interpretation and description of the large scale coherent structures commonly observed in free as well as bounded turbulent shear flows has been discussed. The experimentally observed cyclic development of nonlinear two dimensional vorticity concentrations in homogeneous, incompressible, free mixing layers has been linked to the growth/equilibration of finite amplitude, spatially amplifying instabilities and their cyclic regeneration under the action of intrinsic secondary instabilities evoked by flow nonlinearity. The mathematical modeling of such nonlinear behavior in terms of matched asymptotic expansion solutions of the Navier-Stokes equations, being reported under separate cover, has been reviewed. The relevance of the physical viewpoint and the mathematical model to more general turbulent flows has been examined and supported by an analysis of selected, conditionally sampled, measurements in transitional and turbulent boundary layers. On that basis, a dominant role of specific nonlinear wave processes has been indicated, and the approach to their systematic mathematical modeling from first principles has been outlined. GRA

HC A06/MF A01 CSCL 20/4

This paper considers the existence problem for solutions of the free boundary value problem which arises from the question of the existence of solitary gravity waves, moving without changes of form, and with constant velocity, on the surface of ideal fluid in a horizontal canal of finite depth. The analysis imposes no restriction on either the slope or the amplitude of the wave, and we prove that there exists a connected set of solitary waves containing waves of all slope between 0 and PI/6. It is then proved that each of these solitary waves has finite mass, and, as a consequence, that F = 1, where F is the Froude number. This, in turn, tells us that the solitary wave decays faster than exp(-alpha abs.val.(x/h), where alpha is an element of (0, alpha-bar) and (tan alpha-bar) = F squared. Finally, it is shown that, in a certain limit, these solitary waves converge to a

solitary Stokes wave of greatest height, and the validity of Stokes' conjecture for solitary waves is considered, but not resolved. GRA

TRANSITION TO TURBULENCE IN FREE SHEAR-LAYERS Final Report, Oct. 1974 - Oct. 1979
A. Demetriades Oct. 1979 80 p refs
(Contract F44620-75-C-0016; AF Proj. 2307)
(AD-A080066; U-6573; AFOSR-80-0056TR) Avail: NTIS HC A05/MF A01 CSCL 20/4

Part 1 of this report presents an investigation of the transition to turbulence in free shear layers. A theoretical analysis is performed to drive a formula for predicting transition, based on the novel approach used earlier by the same investigators to predict transition in wakes and boundary layers. The formula so derived shows that the transition Reynolds number increases as the non-dimensional velocity ratio decreases, and also as the fast side Mach number and slow side total temperature are increased. An experiment to test the theory was performed; together with earlier transition data, the new data provide good support for the theory. However, a strong dependence of the transition Reynolds number on unit Reynolds number characterizes the available data, whereas the theory does not predict such dependence. In Part 2 of this report a brief account is given on the measurement of temperature fluctuations in a cooled compressible turbulent wake. The results endorse the novel detection technique utilized, and support theoretical predictions made earlier under this contract. GRA

FLUID AND THERMODYNAMIC CHARACTERISTICS OF COMPRESSIBLE RECOIL Final Report, Jun. 1978 - Aug. 1979
Ching Jen Chen and Enzo O. Macagno Aug. 1979 81 p refs
(Grant DAAG29-78-G-0120)
(AD-A078587; ARO-16016.1-A-3E) Avail: NTIS HC A05/MF A01 CSCL 19/6

Fluid dynamic aspect of recoil mechanisms is studied with simple one dimensional analysis as well as two dimensional numerical analysis. Method and procedure for experimental simulation is given. Full scale and reduced scale simulation is analyzed for its advantages and disadvantages. A new numerical scheme called 'finite differential' method is developed to solve the two dimensional unsteady Navier-Stokes equation. The new method utilizes the local analytical solution of the total problem. The solution of the problem is obtained by assembling the local analytic solution. The method is shown to be capable of solving flows with high Reynolds numbers. GRA

TECHNIQUE FOR MEASURING THE APPARENT THERMAL CONDUCTIVITY OF FLAT INSULATION
J. P. Moore, D. L. McElroy, and S. H. Jury Oct. 1979 51 p refs
(Contract W-7405-eng-26)
(ORNL/TM-6494) Avail: NTIS HC A04/MF A01

A technique for measuring the apparent thermal conductivity, gamma, of flat insulations - either batt or loose - is described. This technique consists of a flat Nichrome-screen wire sandwiched between two samples and heated electrically. Results from a limited experimental test are described and compared with results from a pipe insulation tester. Thermal modeling of this system shows that accurate measurement with gamma down to 0.01 W/mK and insulation thicknesses below 0.089 m (3 1/2 in.) should be straightforward. Measurement of gamma for material as thick as 0.305 m (12 in.) should also be possible with a lateral guard scheme to reduce heat flow along the screen wire heater. DOE

The basic internal transport processes in natural waters and the interactions at the air water interface were studied. Thermal and flow structure in a stratified layer of water heated by radiation source and/or cooled by forced air flow over the surface was studied in the laboratory. The transport processes occurring in impounded waters were simulated in a test cell. Heating from below of a nonuniformly stratified layer of water was studied to obtain understanding of turbulent mixing processes in an inherently unstable situation. A model based on conservation principles and turbulence was developed which agreed reasonably well with the experimental data. GRA

MODELING AND ERROR ANALYSIS OF A SUPERCONDUCTING GRAVITY GRADIOMETER Ph.D. Thesis

Kai Yuen Wang 1979 257 p

Avail: Univ. Microfilms Order No. 8006366

The feasibility of a cryogenic gravity gradiometer is demonstrated. A pair of superconducting accelerometers were constructed and tested in a push pull arrangement. The resolution of the experimental unit is estimated to be about 50 E. A study to model the responses of the gravity gradiometer to the various external inputs is conducted. The mathematical equations derived are used in the design of the loaded diaphragm proof mass. The error sources of the gravity gradiometer are identified. The theory of electronic damping for the cryogenic device is developed. An experimental circuit for the noiseless damping of a single accelerometer is described. Dissert. Abstr.

DIGITAL WAVEFORM RECORDING AND COMPUTER ANALYSIS OF ACOUSTIC EMISSION AND ULTRASONIC TRANSIENTS DETECTED BY OPTICAL AND PIEZOELECTRIC PROBES Ph.D. Thesis

Borislav Roro Djordjevic 1980 150 p

Avail: Univ. Microfilms Order No. 8006909

Innovative optical probes and conventional piezoelectric transducers were used to detect acoustic emission and ultrasonic transients in solid materials. Digital signal recording and computer analysis methods were developed for critical evaluation of the these transients. The fast digitizing acquisition system permitted coincident and simulataneous two channel recording thus allowing direct comparison of the same event as sensed by two different detectors. Optical detection of carefully controlled acoustic emission events confirmed the suspected inadequacy of piezoelectric transducers for recording the actual waveforms characteristic of the source. In addition, optical detection showed that piezoelectric transducers have limited capability for direct reproduction of ultrasonic waveforms even for the case of normally incident plane wavefronts. Dissert. Abstr.

CDS SOLID STATE PHASE INSENSITIVE ULTRASONIC TRANSDUCER Patent

Joseph S. Heyman, inventor (to NASA) Issued 25 Mar. 1980 8 p Filed 26 Jul. 1978 Supersedes N78-29871 (16 - 20, p 2725)

(NASA-Case-LAR-12304-1; US-Patent-4,195,244; US-Patent-Appl-SN-928130; US-Patent-Class-310-311; US-Patent-Class-29-25.35; US-Patent-Class-310-327; US-Patent-Class-310-334; US-Patent-Class-310-360) Avail: US Patent and Trademark Office CSCL 14B

A phase insensitive ultrasonic transducer which includes a CdS crystal that is annealed for a selected period of time and at a selected temperature to provide substantially maximum acoustic attenuation at the operating frequency of the transducer is described. Two electrodes are attached to the crystal with amplifier means and a signal processing system connected to one of the electrodes to provide an ultrasonic receiver.

ATTACHING OF STRAIN GAGES TO SUBSTRATES Patent

Meyer M. Lemcoe (Battelle Columbus Labs., Ohio) and Harry E. Pattee, inventors (to NASA) (Battelle Columbus Labs., Ohio) Issued 25 Mar. 1980 4 p Filed 16 Feb. 1978 Supersedes N78-18393 (16 - 09, p 1160) Sponsored by NASA

(NASA-Case-FRC-10093-1; US-Patent-4,195,279; US-Patent-Appl-SN-878539; US-Patent-Class-338-2; US-Patent-Class-219-85R; US-Patent-Class-219-85CA; US-Patent-Class-219-85CM) Avail: US Patent and Trademark Office CSCL 14B

A method and apparatus for attaching strain gages to substrates is described. A strain gage having a backing plate is attached to a substrate by using a foil of brazing material between the backing plate and substrate. A pair of electrodes that are connected to a current source, are applied to opposite sides of the backing plate, so that heating of the structure occurs primarily along the relatively highly conductive foil of brazing material. Field installations are facilitated by utilizing a backing plate with wings extending at an upward incline from either side of the backing plate, by attaching the electrodes to the wings to perform the brazing operation, and by breaking off the wings after the brazing is completed.

TRANSIENT RESPONSE OPTIMIZATION OF PIEZOELECTRIC DISC TRANSDUCERS BY TIME DOMAIN TECHNIQUES Ph.D. Thesis

Henry Alan Wolf 1979 250 p

Avail: Univ. Microfilms Order No. 8006072

Design procedures for reducing the mechanical ringing of piezoelectric disc transducers under impulsive electrical excitation are examined. The transducer was treated as a three port device: the two mechanical ports and one electrical port. Improvements to the transient response were sought through the determination of appropriate matching networks at the ports. The optimization of specified time domain characteristics was accomplished by performing a gradient search over a parameter space defining the port matching configurations. The transducer and mechanical matching sections were modeled using the Mason equivalent circuit and the distributed parameter wave guide model. Transformation to the time domain was achieved using a numerical approximation to the Laplace transform. Dissert. Abstr.

SOME ASPECTS OF BLOCK QUANTIZATION WITH APPLICATIONS TO SOURCE CODING AND DIGITAL HOLOGRAPHY Ph.D. Thesis
James Atlee Bucklew 1979 109 p
Avail: Univ. Microfilms Order No. 8005837

It is shown that the mean square error for optimal uniform and nonuniform one dimensional quantizers is given by the quantizer input variance minus the output variance. In the two-dimensional case when the random variable has a circularly symmetric probability density, an expression that indicates whether a polar or Cartesian format produces a smaller mean square error is derived. The independent two dimensional Gaussian case is considered in detail and tabulations are made of the expected mean square error for a number of quantizer output levels. An error expression is also derived for spectral phase coding, a polar format coding scheme. The scheme is shown to be insensitive to changes in signal statistics. Finally, several computer generated holograms with information represented in polar and rectangular format are compared and error expressions are derived.
Dissert. Abstr.

AN INITIAL ASSESSMENT OF THE PERFORMANCE ACHIEVED BY THE SEASAT-1 RADAR ALTIMETER
William F. Townsend Feb. 1980 41 p refs
(NASA-TM-73279) Avail: NTIS HC A03/MF A01 CSCL 14B

The results of an initial on-orbit engineering assessment of the performance achieved by the radar altimeter system flown on SEASAT-1 are presented. Additionally, the general design characteristics of this system are discussed and illustrations of altimeter data product are provided. The instrument consists of a 13.5 GHz monostatic radar system that tracks in range only using a one meter parabolic antenna pointed at the satellite nadir. Two of its unique features are a linear FM transmitter with 320 MHz bandwidth which yields a 3.125 nanosecond time delay resolution, and microprocessor implemented closed loop range tracking, automatic gain control (AGC), and real time estimation of significant wave height (SWH). Results presented show that the altimeter generally performed in accordance with its orginal performance requirments of measuring altitude to a precision of less the 10 cm RMS, significant wave height to an accuracy of + or - 0.5 m or 10%, whichever is greater, and ocean backscatter coefficient to an accuracy of + or - 1 db, all over an SWH range of 1 to 20 meters. HOLOGRAPHIC INTERFEROMETRIC SURVEY OF BOUNDARY LAYER TRANSITION IN AN AXISYMMETRIC FREE CONVECTION THERMAL BOUNDARY LAYER M.S. Thesis
Gregory S. Meserve Dec. 1979 73 p
(AD-A079880; AFIT/GAE/AA-79D-12) Avail: NTIS HC A04/MF A01 CSCL 14/2

Unique optical data from the laminar and transition regions of an axisymmetric free convection thermal boundary layer are presented. The boundary layer encompasses a vertically oriented right circular cylinder kept at a constant wall temperature and suspended in a quiescent air environment. Pulse laser holographic interferometry was used to obtain a measurement of the temperature distribution through the boundary layer. Schlieren methods are used to photograph the boundary layer to provide a qualitative description of the transition region. An approach is outlined to find an approximate numerical solution for the temperature distribution through the boundary layer. Integral equations are developed for a differential control volume within the boundary layer after which assumed velocity and temperature distributions are used to reduce the integral equations to first order non-linear differential equations. The differential equations are non-dimensionalized and numerical techniques are used in an attempt to obtain a solution. Quantitative data from the laminar region resulted in a discrepancy between theoretical and experimental evaluation of a local Nusselt number. Qualitative observation of the transition region reveals a fringe reversal phenomena that could possibly be associated with the fundamental mechanisms of transition. GRA

FRAME C: A COMPACT PROCEDURE FOR QUANTITATIVE ENERGY-DISPERSIVE ELECTRON PROBE X-RAY ANALYSIS Final Report
R. L. Myklebust, C. E. Fiori, and K. F. J. Heinrich Sep. 1979 115 p refs
(PB80-110307; NBS-TN-1106) Avail: NTIS HC A06/MF A01 CSCL 14B

A data evaluation procedure (FRAME C) for carrying out quantitative electron probe microanalysis with a lithium-drifted silicon detector was developed for use with a small computer. The procedure consists of a background correction calculated from two selected background regions of interest, a simple method of resolving overlapping peaks, and the matrix corrections for characteristic radiation. To save computation time, small groups of adjacent channels (regions of interest) in the multichannel analyzer rather than individual channels are used for the calculations. The method for computing the overlap factors is described. Examples of several types of analyses are presented. GRA

DOWNSTREAM MIXING GASDYNAMIC LASERS: A NUMERICAL SOLUTION Ph.D. Thesis
Karungulam Natesan Parthasarathy 1979 164 p
Avail: Univ. Microfilms Order No. 8007108

A numerical solution for downstream mixing gasdynamic laser flows is considered. In particular, the supersonic mixing flows of vibrationally excited N2 with cold CO2 and H2O downstream of the nozzle exits is studied. The unsteady, two dimensional Navier-Stokes equations, fully coupled with the appropriate finite rate vibrational kinetic equations are solved by means of a time dependent finite difference numerical technique. The main thrust of the work is the investigation of the fluid dynamic and kinetic aspects of mixing. The detailed, but complex vibrational kinetic processes that occur in the CO2-N2 system are simplified by the use of either a two mode model, or a three mode model. The effect of the boundary layers issuing from the nozzles on the mixing phenomenon is studied. Dissert. Abstr.

GENERATION OF 16 MICRON RADIATION USING STIMULATED ROTATIONAL RAMAN SCATTERING IN HYDROGEN Ph.D. Thesis
William Richard Trutna, Jr. 1979 134 p
Avail: Univ. Microfilms Order No. 8006360

Stimulated rotational Raman scattering was used to frequency shift a CO2 TEA laser from 10.6 micrometers to 16.95 micrometers. Two techniques were used to lower the CO2 laser power requirements: a 25 transit Raman cell was constructed, which maintains a high pump intensity over a long distance, to maximize Raman gain; and, four wave mixing was utilized to generate 16.95 micrometer signal at the kilowatt level to inject into the Raman amplifier. Since the CO2 laser tends to oscillate at many axial mode frequencies, a study to determine the dependence of Raman gain and Stokes bandwidth upon the pump laser bandwidth was undertaken. The results were experimentally verified using a variable bandwidth Nd:YAG laser at 1.06 micrometers. The results of experiments with an antiresonant ring resonator operated with a low pressure pulsed CO2 laser are described. Dissert. Abstr.

METHOD AND APPARATUS FOR CONVECTION CONTROL OF METALLIC HALIDE VAPOR DENSITY IN A METALLIC HALIDE LASER Patent Application
Thomas J. Pivirotto, inventor (to NASA) (JPL) Filed 14 Mar 1980 14 p
(Contract NAS7-100)
(NASA-Case-NPO-15021-1; US-Patent-Appl-SN-130496) Avail: NTIS HC A02/MF A01 CSCL 20E

A method and apparatus for convection control of metallic halide vapor density in a metallic halide laser are described. A reservoir containing copper chloride is heated so that the copper chloride is maintained in a liquid form. The apparatus includes a means for flowing a buffer gas (neon) over the liquid copper chloride to provide a mixture of copper chloride vapor and neon above the liquid copper chloride. A conduit for providing fluid communication between the reservoir containing the copper chloride vapor/neon mixture and the laser is also included. The copper chloride vapor density in the laser is related to the liquid copper chloride temperature and the neon flow rate through the reservoir. Neon is also provided directly to the laser in order to provide a further means of controlling the copper chloride vapor density in the laser. NASA

ERROR ANALYSIS FOR A SPACEBORNE LASER RANGING SYSTEM
Erricos C. Pavlis Dec. 1979 89 p refs
(Grant NsG-5265; OSURF Proj. 711055)
(NASA-CR-162887; Rept-290) Avail: NTIS HC A05/MF A01 CSCL 20E

The dependence (or independence) of baseline accuracies, obtained from a typical mission of a spaceborne ranging system, on several factors is investigated. The emphasis is placed on a priori station information, but factors such as the elevation cut-off angle, the geometry of the network, the mean orbital height, and to a limited extent geopotential modeling are also examined. The results are obtained through simulations, but some theoretical justification is also given. Guidelines for freeing the results from these dependencies are suggested for most of the factors. M.G.

SEPARATION CONTROL IN ALL APT LIGHT PIPE M.S. Thesis
W. H. Bailey, Jr. Dec. 1979 92 p refs
(AD-A079904; AFIT/GAE/AE/79D-1) Avail: NTIS
HC A05/MF A01 CSCL 20/5

An experiment was performed to determine separation regions inside a high energy laser (HEL) beam relay light pipe. The pipe is part of the beam relay system used in conjunction with the CO2 Gas Dynamic Laser (GDL) system under development by the Air Force Weapons Laboratory. It was found that the air flowing through the pipe separated at the elbows. This separation can cause uneven radial heating attributed to molecular absorption. The self-induced thermal distortion of the beam can cause phase distortions degrading the beam. A study of separation control systems within the pipe was made. A full-scale axisymmetric model was studied on the water table. Areas of separation were found by flow visualization using dye injection. A brief evaluation of suction and blowing to control separation showed both of these methods acceptable. Separated regions discovered at each elbow on the water table were the focus of study for a full-scale air flow plexiglass model. The turbulent flow in the pipe was studied using smoke injection to reveal air motion in the pipe. Mass flow rates of air through the pipe were 1 lb/min and 8 lbs/min. Suction and blowing were assessed as flow separation control methods. GRA

(Contract F04611-77-C-0039; AF Proj. 2308)
(AD-A080037; UTRC/R79-922895; AFRPL-TR-79-51) Avail: NTIS HC A07/MF A01 CSCL 21/8

This report describes the analytical and experimental results of a study to determine the feasibility of using molecular seeds to couple CO2 laser radiation and CO laser radiation to the working fluid, H2, of a high performance rocket thruster. The gas mixtures studied experimentally were H2/H2O, H2/D2O, and H2/NH3 at CO2 laser wavelengths. The promise of CO as an absorber of CO laser radiation was established analytically. To attain the high temperatures, 1000-6000K, desired, these mixtures were placed in a cell positioned in a diagnostic apparatus which determined the spatial variation of the mixture absorption coefficient and temperature about the axis of a hot, dense plasma sustained by focused high power CW CO2 laser radiation. The measurements on these mixtures indicated their performance as couplers to exceed expectations created by the analytical study. In addition, it was found that in the absence of plasma, the temperature of the mixtures could be raised to temperatures as high as 2000-4000K simply by absorption by the mixture of laser energy at the high power beam focal spot to create the observed laser sustained flame. Further work is needed to determine the conditions under which this flame can be sustained in the laser energized rocket thruster. GRA

STUDIES OF THE STATISTICAL BIAS AND SIGNAL CHARACTERISTICS OF LASER VELOCIMETERS Final Report, Jul. 1976 - Sep. 1977
D. O. Barnett and T. V. Giel, Jr. AEDC Jan. 1980 147 p refs
(AD-A079634; AEDC-TR-78-65) Avail: NTIS
HC A07/MF A01 CSCL 14/2

Analyses are presented of (1) the statistical bias individual realization laser velocimeters (LV's) and (2) the theoretical signal amplitudes obtained from dual-scatter (fringe) LV's. The analyses are compared to experimental data obtained from a subsonic, confined, seeded jet. The statistical bias study reviews the various formulations relating LV sampling characteristics to the velocity field and shows that, theoretically, bias is reduced by random sampling, introduction of fixed-time delays between samples, and nonuniformities in seeding. These concepts are tested by a bias simulation program which simulates LV response to a turbulent flow by applying various sampling laws to hot-wire anemometer data. The finite-difference algorithms suggested by various investigators to eliminate bias from LV data fail if the sampling rate is less than the local integral time scale of the turbulent flow. Velocity data for the near field of a uniformly seeded subsonic jet exhausting into a plenum were obtained by pitot probes, hot-wire anemometers, and a Bragg-diffracted laser velocimeter. No consistent bias of the data was observed, indicating that routinely correcting LV data for statistical bias may lead to significant errors. GRA

EFFICIENT HIGH ENERGY INFRARED THIRD HARMONIC GENERATION IN GASES AND LIQUIDS FOR LASER FUSION APPLICATIONS Final Report, 1 Mar. 1977 - 28 Feb. 1979
H. Kildal and S. R. J. Brueck May 1979 21 p
(COO-4251-7) Avail: NTIS HC A02/MF A01

A 4% third harmonic generation (THG) energy conversion efficiency was achieved and for 8-nsec-duration input pulses in a liquid CO-O2 medium (10 cm path length). The THG input-output characteristics in the saturation and pump-depletion regime were measured. A 2% THG power conversion efficiency was obtained for 120-nsec duration input pulses in liquid CO-O2-SF6 mixtures. A theoretical model was developed for two-photon resonant THG processes in different focusing geometries. Liquid CO two-photon resonance parameters were measured in various diluents. The calculated resonant third-order susceptibility for different CO concentrations were verified. The nonresonant third-order susceptibility in liquid CO-O2 and the wave-vector mismatch in liquid CO-O2 mixture was measured. Phase-matching techniques for THG were developed. Alternate systems for tripling of CO2 and HF laser radiation were analyzed, and a 1- to 10-nsec pulse duration CO2 laser facility and cryogenic liquid Dewars with 10 cm to 1 m optical path lengths were constructed. CONCEPTUAL DESIGN STUDY OF THE HYLIFE LITHIUM WATERFALL LASER FUSION CHAMBER Annual Report, Fiscal Year 1978

29 Sep. 1978 109 p refs

(Contract W-7405-eng-48)

(UCRL-13944) Avail: NTIS HC A06/MF A01

Conceptual design studies of the target chamber defined the general configuration and dimensions of the chamber and the inlet plenum, orifice plate, and nozzle concepts required to generate the desired lithium jet fall. Preliminary studies were performed of the target chamber interfaces with the liquid lithium supply system, the laser system, the pellet injection system, and the target chamber mounting and support system. Target chamber environmental effects resulting from typical thermonuclear burns were evaluated. The outlet region of the target chamber was outlined conceptually, and preliminary design considerations were given to the annual graphite reflector regions of the target chamber and the associated liquid lithium coolant passages. ROTOR MODEL PARAMETERS ESTIMATION AND ROTOR BALANCING STUDIES WITH QUADRATIC PROGRAMMING Ph.D. Thesis

Emerson Keith Woomer 1979 133 p

Avail: Univ. Microfilms Order No. 8004602

The parameter estimation problem is formulated as an optimization process in which unknown constants in the system model are adjusted to give the best agreement between the measured response of the rotor to an applied unbalance and the predicted response from the model. A computer code based on Lemke's algorithm for quadratic programming is used to demonstrate the reliable, efficient computation of rotor balance weights when upper bounds are placed on the weight magnitudes. Heuristic criteria for estimating best choices of balance weight locations are evaluated by comparing the predictions based on the criteria to optimal locations determined by exhaustive search or estimated by random sampling. The influence of the distribution of intrinsic shaft unbalance on optimal balance weight locations and on the magnitudes of normalized curves of shaft deflections and phases is also studied. Dissert. Abstr.

SURFACE TEMPERATURES AND GLASSY STATE INVESTIGATIONS IN TRIBOLOGY, PART 3 Final Report
Scott S. Bair and Ward O. Winer Washington NASA Apr. 1980 85 p refs
(NASA-CR-3272) Avail: NTIS HC A05/MF A01 CSCL 20L

Research related to the development of the limiting shear stress rheological model is reported. Techniques were developed for subjecting lubricants to isothermal compression in order to obtain relevant determinations of the limiting shear stress and elastic shear modulus. The isothermal compression limiting shear stress was found to predict very well the maximum traction for a given lubricant. Small amounts of side slip and twist incorporated in the model were shown to have great influence on the rising portion of the traction curve at low slide-roll ratio. The shear rheological model was also applied to a Grubin-like elastohydrodynamic inlet analysis for predicting film thicknesses when employing the limiting shear stress model material behavior. K.L.

THE PARTICLE DYNAMICS OF TARGET PENETRATION Final Report
James Dahn Sep. 1979 109 p
(DA Proj. 1L1-61102-AH-43)
(AD-A077114; AD-E430331; ARBRL-TR-02188) Avail: NTIS HC A06/MF A01 CSCL 19/4

New approaches are proposed for describing some of the principal features of target penetration by a projectile in the ordnance velocity range. These features include the following observed facts: (1) curved trajectories including the possibilities of perforation, embedment or ricochet, (2) loss of mass by erosion, and (3) breakup of the projectile into sizable pieces. Each of the approaches proposed is illustrated by examples. In addition, a considerable amount of literature on the subject is reviewed in order to place these new approaches in context. After providing historical background on his topic, the author develops and illustrates his basic ideas concerning a constant mass penetrator. He then extends the theory to the case of a variable mass penetrator, and considers a model of projectile breakup. GRA

DESIGN OF HELICAL COMPRESSION SPRINGS Final Report
Henry P. Swieskowski Aug. 1979 64 p refs
(AD-A077113; AD-E400353; ARSCD-TR-79002) Avail: NTIS HC A04/MF A01 CSCL 13/9

In this mathematical study on helical spring design, three basic types of load requirements are distinguished and treated individually: (1) the load at assembled height; (2) the load at minimum compressed height; and (3) the energy content of the spring. Conventional load and stress deflection formulas are modified by the replacement of dependent variables with independent values. The ratio of the final spring deflection over the working stroke is formulated to show the variation of the final stress with various required load-space conditions. Optimum design parameters are established to minimize the final operating stress value. Direct and simplified analytical design procedures are developed for round wire and rectangular wire compression springs. Also presented are nomographs for use as design aids and detailed numerical design examples. This study combines design characteristics and stress advantages of nested spring systems versus a single spring for equivalent load conditions. GRA

HYDRAULIC DIAGNOSTIC MONITORING SYSTEM
31 May 1979 267 p
(Contract N62269-78-C-0041)
(AD-A077552; NADC-TR-76389-30) Avail: NTIS HC A11/MF A01 CSCL 13/7

The purpose of the Hydraulic Diagnostic Monitoring System (HYCOS) is to warn of impending failure of hydraulic system components by onboard sensors continuously monitoring failure-indicating parameters. The monitoring system consists of three basic types of sensors: analog, discrete, and fiber-optic. These sensors feed information to a self-contained, centrally located display panel through interface circuits that are easily accessible to ground maintenance personnel. The panel has circuit and system test capability which detects malfunctions of the display indicators, electronic equipment, and sensor circuits. Task 1 encompassed the design, development and procurement of hardware, sensors and microprocessors for two diagnostic monitoring systems. Task 2 installed one system on the F-14 a Hydraulic Simulator for system component reliability demonstrations. The task also covered simulated component failures and diagnostic system reaction. GRA

INERTIA AND FRICTION WELDING OF ALUMINUM ALLOY 1100 TO TYPE 316 STAINLESS STEEL
M. A. Perkins Oct. 1979 25 p refs Revised
(Contract W-7405-eng-26)
(Y-2165-Rev) Avail: NTIS HC A02/MF A01

The inertia and friction-welding processes were evaluated for joining aluminum alloy 1100-H14 and Type 316 vacuum-induction melted, vacuum-arc remelted stainless steel. While both processes consistently produced joints in which the strength exceeded the strength of the aluminum base metal, 100 percent bonding was not reliably achieved with inertial welding. The deficiency points out the need for development of nondestructive testing techniques for this type of joint. Additionally, solid-state volume diffusion did not appear to be a satisfactory explanation for the inertial and friction-welding bonding mechanism. DOE

PULSE-WIDTH-MODULATED AMPLIFIER DRIVES FOR MACHINE TOOLS
W. E. Barkman Nov. 1979 10 p
(Contract W-7405-eng-26)
(Y/DX-02) Avail: NTIS HC A02/MF A01

The use of a dc servo controller to convert command and feedback information into an error signal that is used to drive a dc motor is discussed. The controller utilizes a summing technique that compares an input command voltage with a feedback voltage from an external transducer. The resultant error signal is applied to a linear or a switching servo amplifier. While the output of the linear amplifier may have the ideal representation of the desired drive signal, it does result in substantial power dissipation within the amplifier and requires forced air cooling for power ratings above 100 to 200 W. The switching amplifier avoids this problem by rapidly changing the state of its output stage from a conducting to a nonconducting condition, thereby minimizing the operation of the output stage in the high power dissipation region. The design and operation of the amplifier drive are described. DOE

DECONTAMINATION OF METALS CONTAINING PLUTONIUM AND AMERICIUM
M. G. Seitz, T. J. Gerding, and M. J. Steindler Jun. 1979 57 p refs
(Contract W-31-109-eng-38)
(ANL-79-13) Avail: NTIS HC A04/MF A01

A conceptual design of a melt refining process to decontaminate plutonium- and americium-contaminated metals is described. The process includes single-stage refining of contaminated metals to produce a metal product which would have less than 10 nCi/g of TRU-element contamination. Two plant sizes were considered. The smaller conceptual plant processes 77 kg of metal per 8 hour period and may be portable. The larger one processes 140 kg of metal per 8 hour period, is stationary, and may be near the maximum size that is practical for a metal decontamination process. DOE

INTERNAL QUALITY OF ALUMINUM DIE CASTINGS Ph.D. Thesis
Lester Wayne Garber 1979 255 p
Avail: Univ. Microfilms Order No. 8006003

The effects of experimental manipulations and random variations of several process variables on the internal quality of aluminum die castings are investigated. Particular consideration is also given to determine whether entrapped air or internal solidification shrinkage is the principal cause of the greatest volume of porosity within aluminum die castings. The independent variables in the experimental design are intensification pressure, fast shot plunger velocity, die temperature gradient, metal temperature in the holding furnace, and die open time. High levels of intensification pressure and low levels of fast shot plunger velocity are found to produce castings of better internal quality. Of the random variations tested, biscuit lengths and pressure-related variables are found to affect internal quality. Internal solidification shrinkage, and not entrapped air, is found to be the principal cause of the greatest volume of porosity within aluminum die castings. Dissert. Abstr.

BOUNDING THE RELIABILITY OF MULTISTATE SYSTEMS
David A. Butler Aug. 1979 38 p refs
(Contract N00014-75-C-0561)
(AD-A075579; TR-193) Avail: NTIS HC A03/MF A01 CSCL 12/1

This report develops a number of upper and lower bounds for the reliability of multistate systems, that is, systems for which each component may exist in one of a finite number of states. These bounds are based on notions of multistate minimal paths and minimal cuts. The bounds are far more easily computed than the exact system reliability. In order to further reduce the computations required and obtain sharper bounds, a modular-decomposition-based bound is developed for multistate systems. GRA

REPORT ON THE ACOUSTIC EMISSION EXAMINATION OF GLASS-FIBER-REINFORCED PLASTIC PIPES
W. Brockmann and K. Wolitz Oct. 1979 18 p
(UCRL-Trans-11520) Avail: NTIS HC A02/MF A01

From the results reported, it can be concluded that acoustic emission analysis is suitable as a technique for quality control of high-pressure pipes, because it permits critical processes (fiber breaks) to be distinguished from noncritical processes (delamination, breaks between fibers) at pressure loads up to the rated load. If further tests with a larger number of test specimens can establish a statistically significant correlation between the proportion of fiber breaks below the rated pressure and the bursting pressure which actually occurs, it will be possible, by using acoustic emission analysis and test loads up to the rated pressure, to dispense with an individual test at double rated load, which in its own right can damage, beyond the critical point, a system designed for a load. The use of acoustic emission analysis thus leads to increased safety of the pipes. DOE

ACOUSTIC EMISSION: WHO NEEDS IT AND WHY?
J. C. Spanner May 1979 27 p refs Presented at the Intern. Conf. on Acoustic Emission, Anaheim, Calif., 10 Sep. 1979
(Contract EY-76-C-14-2170)
(HEDL-SA-1808-FP; CONF-790966-2) Avail: NTIS HC A03/MF A01

The growing industrial interest in acoustic emission is examined. Some of the inherent limitations of conventional nondestructive test methods are discussed, and several surveys of defects found during the manufacture and operation of pressure boundary components are reviewed. Acoustic emission offers potential for providing increased assurance of both initial and continued structural integrity. Furthermore, if acoustic emission is properly applied in conjunction with fitness-for-purpose criteria, it may be possible to reduce present manufacturing costs without compromising actual structural adequacy. NDT (NON-DESTRUCTIVE TEST)/ROAD CORRELATION Final Report
Henry C. Hodges and Henry C. Hodges, Jr. 18 Apr. 1979 19 p
(Contract DOT-HS-7-01589)
(PB80-106636; DOT-HS-805-034) Avail: NTIS HC A02/MF A01 CSCL 13F

Several nondestructive test (NDT) methods were compared and water coupled ultrasonics produced the most accurate and repeatable data for three dimensionally positioning tire anomalies. For the continuation of the evaluation of water coupled ultrasonics 75 recapped test tires were obtained, including bias, bias-belted and radial, and scheduled for 10,000 miles of highway durability. The tires, in general, only obtained one-third that mileage due to catastrophic failures and treadwear anomalies. These tires were NDT-inspected prior to test and after test to analyze the ability of water coupled ultrasonics to differentiate between those tire anomalies which lead to degraded road performance and those which do not. GRA

ON THE THEORY OF CYCLIC VISCOPLASTICITY Ph.D. Thesis
Chian-Eong Yen 1979 260 p
Avail: Univ. Microfilms Order No. 8005513

A theory of cyclic viscoplasticity is developed to describe the observed rate- and history-dependent behavior of structural materials under complex loading conditions. It quantitatively accounts for the viscid effect, the anisotropic yield surface distortion, and the material behavior observed under cyclic loading conditions including cyclic hardening, cyclic softening, and the material memory of prior loading history. The theory includes a hardening rule, a rate-dependent flow rule, and an expression for the inelastic modulus of the quasi-static effective stress-effective inelastic strain curve. Computations are carried out for uniaxial random cyclic loading for type 304 stainless steel at elevated temperature and for simulations of experiments for pure aluminum under complex combined tension-compression and torsion loadings. Dissert. Abstr.

N80-20609 Michigan State Univ., East Lansing.
MEASUREMENT OF TRANSIENT RESPONSE OF A CENTRAL CRACK TO A TENSILE PULSE Ph.D. Thesis
Abdurahman Ahmed Sukere 1979 120 p
Avail: Univ. Microfilms Order No. 8006193

The behavior of a crack in a stress wave environment was investigated. The crack was approximated by electromachined slots in the center of thin aluminum specimens. A tensile impact apparatus was developed for generating a plane tensile pulse with a ramp function profile. Dynamic displacements along the crack surface were measured using a laser interferometric displacement gage. The data were analyzed within the bounds of linear elastic mechanics to estimate the dynamic stress intensity factor. The experimental results for the dynamic crack displacements were found to oscillate, a phenomena attributed to the cancellation and reinforcement of the incident waves by the various scattered waves. Dissert. Abstr.

N80-20610 Purdue Univ., Lafayette, Ind.
FINITE-ELEMENT ANALYSIS OF PROBLEMS INVOLVING STRESS SINGULARITIES Ph.D. Thesis
Wen-Sheng Chan 1979 206 p
Avail: Univ. Microfilms Order No. 8005839

Singular finite elements that contain a square root type of stress singularity were developed for the analysis of crack problems. Several static crack problems, i.e., center, single edge, and double edge cracks, were solved and compared with an available analytical solution. In the dynamic case, the Newmark method was used to integrate the time variable. Both stationary cracks subjected to dynamic loadings and cracks moving with a constant velocity were considered. For the moving crack problems, the dynamic stress intensity factor was computed for an elastic strip subjected to prescribed boundary displacements as well as a simple tension. An 8 node quadrilateral finite element was developed for the lap joint analysis. Effects of the overlap length, and ratio of adherend thickness to adhesive thickness, and clamping forces applied at the edges of overlapping were investigated. Dissert. Abstr.

N80-20611 Tennessee Univ., Knoxville.
FRACTURE MECHANICS OF BI-MATERIAL INTERFACE CRACKS Ph.D. Thesis
Setunath Anna Swamy 1979 132 p
Avail: Univ. Microfilms Order No. 8005428

The behavior of bimetallic interface cracks was investigated. A plate composed of two dissimilar materials bonded together along a straight line containing a center crack was studied. The problem represented an idealization of an adhesive joint or a composite structure with an interfacial flaw or crack. Solutions

obtained using three different approaches were compared in order to develop a recommended procedure for analyzing interface crack problems. The first method was based on the hybrid crack tip element method. Standard eight node isoparametric elements, with modifications to account for singularity, were also used to analyze the problem. Two distinct techniques using this general approach were studied - one based on the mapping technique and the other based on the displacement technique. The mapping technique involved the use of two dimensional isoparametric elements with the midside nodes shifted to the quarter point location. The displacement technique involved the use of two dimensional isoparametric elements with numerically integrated shape functions. Dissert. Abstr.

N80-20612 Wisconsin Univ. - Madison.
A DIAGONALLY DOMINANT SOLUTION FOR THE CYLINDER END PROBLEM AND A NON-AXISYMMETRIC ELASTICITY SOLUTION FOR A TRUNCATED SPHERICAL DOME Ph.D. Thesis
Terry Dale Gerhardt 1979 181 p
Avail: Univ. Microfilms Order No. 8001609

A method for the elasticity solution of the cylinder problem with axisymmetric torsionless end loading is presented. Consideration is given to the specification of arbitrary stresses or displacements on the end of a semi-infinite cylinder with a stress free lateral surface. Utilizing the Papkovich-Neuber potentials, a solution to this problem is obtained in the form of a nonorthogonal eigenfunction expansion. The expansion coefficients must be determined from an infinite system of linear algebraic equations. A Galerkin formulation is presented which makes this system of equations diagonally dominant, allowing the precise calculation of the eigenfunction coefficients regardless of how many equations are kept before truncation. This solution is shown to yield an accurate calculation of cylinder stresses and displacements. A nonaxisymmetric solution for Navier's equations in spherical coordinates is obtained through a direct method, rather than the usual Papkovich-Neuber approach. The solution is specialized to solve the problem of a truncated spherical dome with a closed top. Dissert. Abstr.

N80-20613 Pennsylvania State Univ., University Park.
VIBRATION OF PLATES OF VARIOUS GEOMETRIES Ph.D. Thesis
Earl George Williams 1979 157 p
Avail: Univ. Microfilms Order No. 8006070

Point-driven, flat, thin aluminum plates of various geometries with free boundaries were studied. A theory which allows the mean of the driving point admittance to be predicted over a wide frequency range at any point on these plates was used. The prediction was compared to the experimentally determined admittance. The expected minimum and maximum variations about this mean were predicted and compared to the experimental data over a broad frequency range. Measured loss factors for these free plates were used in the theoretical models. The actual admittance versus frequency for a center driven rectangular plate was predicted using a mode sum technique and compared to measured data. A simple algebraic formula was used to predict the resonance frequencies of the rectangular and square plates with free boundaries. Dissert. Abstr.

N80-20614 Wisconsin Univ. - Madison.
A DIFFERENTIAL POPULATION SYNTHESIS APPROACH TO MASS SEGREGATION IN M92 Ph.D. Thesis
William John Tobin 1979 148 p
Avail: Univ. Microfilms Order No. 8004747

Spectra obtained with a intensified Reticon scanner are presented of 26 low metal stars and of the center and one quarter intensity positions of M92. Spectral coverage is from 390 to 870 nm with resolution better than 1 nm in the blue and 2 nm in the red. Individual pixel signal to noise is about 100. Dwarf features are notably absent from the M92 spectra. Numerical estimates of 36 absorption features are extracted from every spectrum, as are two continuum indices. Mathematical models are constructed describing each feature's dependence on stellar color, luminosity, and metal content and then used to estimate the metal content of 6 of the stars for which the metal content is not known. For 10 features reliably measured in M92's center and edge a mass segregation sensitivity parameter is derived from each feature's deducted luminosity dependence. Dissert. Abstr.

N80-20615 Tufts Univ., Medford, Mass.
CLOSED CELL STRUCTURES USING TRIANGULAR PLATES Ph.D. Thesis
Henry Robert Poydar 1979 131 p
Avail: Univ. Microfilms Order No. 8006712

A method is described by which closed cell structures of single curvature may be constructed using triangular folded plate elements of equal size. When viewed in the transverse plane, these structures are seen to be portions of a regular polygon. Methods for obtaining matrices for nodal coordinates and element connectivity are described. Schlegel diagrams are introduced as a way to help visualize connectivity. This information is used to construct a 350 pound, portable, plywood and aluminum prototype structure which is 9.46 feet high, 8.00 feet wide, and 8.43 feet long. A load was applied along the centerline of the crown of the structure and the nodal displacements measured. The measured displacements were compared to computed values. It is shown that small structures may be constructed using the prescribed method and that their structural response to imposed loads may be predicted by the analysis of a representative plane frame and the application of an appropriate amplification factor. Dissert. Abstr.

TIME-DEPENDENT INELASTIC ANALYSIS BY THE BOUNDARY ELEMENT METHOD AND THE FINITE ELEMENT METHOD Ph.D. Thesis
Maheshchandra Amritial Morjaria 1979 91 p
Avail: Univ. Microfilms Order No. 8003956

Numerical schemes for solution of problems of time-dependent inelastic deformation in metallic bodies using the boundary element method and the finite element method are presented. The formulations utilize combined creep-plasticity constitutive theory with state variables to model material behavior. The boundary element method is applied to general plane stress/strain and plate bending problems. The finite element method is applied to plane stress/strain as well as axisymmetric problems. Numerical solutions for some problems are obtained to illustrate the procedures and their versatility. It is concluded that both the formulations are very general and can be easily applied to problems with complicated geometrics and loading histories. However, with regards to solution time and solution accuracy, the boundary element method is somewhat more efficient than the finite element method for this class of problems. Dissert. Abstr.

AN INVESTIGATION OF RIB STIFFENED HYPERBOLIC COOLING TOWER UNDER STATICAL LOADS USING DISCRETE FIELD AND GALERKIN FINITE ELEMENT METHODS Ph.D. Thesis
Debasish Kumar Roy 1979 171 p
Avail: Univ. Microfilms Order No. 8005566

A rational analysis for rib stiffened hyperbolic shells of revolution is developed. The discrete field macro approach is applied and intended to take advantage of the discretely symmetric structural configuration in the circumferential direction for any axisymmetric shell of revolution. The resulting mathematical model covering the variation in the meridional direction is developed using the finite element numerical technique. The rib-shell interaction is enforced through a set of field displacement compatibility equations by matching rib and shell displacements at rib-lines. The Galerkin finite element method is used to find the rib and shell displacements. A computer program is written for the purpose of investigating either a hyperbolic curved rib, shell of revolution or rib stiffened cooling tower when subjected to statical loads. Several heuristic rib stiffened cooling towers are studied for various load cases. Dissert. Abstr.

SINGULAR FINITE ELEMENT SHAPE FUNCTIONS IN ESTIMATING STRESS INTENSITY FACTORS Ph.D. Thesis
George Hans Staab 1979 129 p
Avail: Univ. Microfilms Order No. 8005945

The general procedure for extracting the stress intensity factor from the finite element solution is discussed. This procedure

is shown to be applicable to mixed mode analysis, such as the oblique edge crack problem. The various methods available for estimating the stress intensity factor are examined and shown to produce acceptable results, which depend on the manner in which the stress intensity factor is estimated. Two shape functions, representing both a simple and a complex displacement field, are used to analyze several problems of practical importance. Each function is shown to accurately estimate the stress intensity for these problems, thus providing further verification that the number of terms used to define the singular element displacement field is of minimal importance. The problems analyzed are the oblique edge crack, beam bending, a split beam, and two bi-material problems. The problem of an interfacial crack along the bond line of two dissimilar media is found to be a case of limited applicabilty for the shape functions considered.

ON THE NONLINEAR DEFORMATION GEOMETRY OF EULER-BERNOULLI BEAMS

Dewey H. Hodges, Robert A. Ormiston, and David A. Peters. Apr. 1980 57 p refs

(NASA-TP-1566; A-7985; AVRADCOM-TR-80-A-1) Avail: NTIS HC A04/MF A01 CSCL 20K

Nonlinear expressions are developed to relate the orientation of the deformed beam cross section, torsion, local components of bending curvature, angular velocity, and virtual rotation to deformation variables. The deformed beam kinematic quantities are proven to be equivalent to those derived from various rotation sequences by identifying appropriate changes of variable based on fundamental uniqueness properties of the deformed beam geometry. The torsion variable used is shown to be mathematically analogous to an axial deflection variable commonly used in the literature. Rigorous applicability of Hamilton's principle to systems described by a class of quasi-coordinates that includes these variables is formally established.

NONLINEAR STATIC TPS ANALYSIS

Jerrold M. Housner and Ramon Garcia. Mar. 1980 20 p refs

(NASA-TM-81785) Avail: NTIS HC A02/MF A01 CSCL 20L

A nonlinear analysis which includes the effect of mismatch and filler bar was developed to predict the strain isolator pad reuseable surface insulation through-the-thickness interface stresses. Parametric studies were conducted for simulated shock loading on square tiles. Expected loads on an actual tile were also studied. The results indicate that when no mismatch is present, linear solutions tend to give nonconservative maximum stresses relative to the nonlinear solutions. When mismatch is present, the linear maximum stresses are only conservative at low load levels and highly nonconservative at high load levels. Although the presence of filler bar reduces maximum tensile stresses in some cases, it does not appear that the nominal dimension filler bar can reduce the nonlinear stress to a level at which the linear solution becomes conservative relative to the nonlinear solution. Moreover, on an outboard trailing edge elevon tile at descent with +20 deg flap, the linear analysis is 49% nonconservative relative to the nonlinear analysis with filler bar.

USE OF TWO-DIMENSIONAL TRANSMISSION PHOTOELASTIC MODELS TO STUDY STRESSES IN DOUBLE-LAP BOLTED JOINTS: LOAD TRANSFER AND STRESSES IN THE INNER LAP Progress Report

Michael W. Hyer. Mar. 1980 65 p refs

(Grant NsG-1621)

(VPI-E-80-9) Avail: NTIS HC A04/MF A01 CSCL 20K

The determination of the stress distribution in the inner lap of double-lap, double-bolt joints using photoelastic models of the joint is discussed. The principal idea is to fabricate the inner lap of a photoelastic material and to use a photoelastically sensitive material for the two outer laps. With this setup, polarized light transmitted through the stressed model responds principally to the stressed inner lap. The model geometry, the procedures for making and testing the model, and test results are described.

THERMO-ELASTIC-PLASTIC STRESSES IN HOLLOW CYLINDERS DUE TO QUENCHING

J. D. Vasilakis and P. C. T. Chen. Oct. 1979 23 p refs

Presented at the 25th Conf. of Army Mathematicians, Baltimore, 6-8 Jun. 1979

(DA Proj. 1L1-61101-A-91A)

(AD-A077109; ARLCB-TR-79025) Avail: NTIS HC A02/MF A01 CSCL 20/11

A hollow cylindrical tube rapidly quenched for the purpose of developing a high strength material structure is analyzed. The quenching creates severe thermal stresses early in the quenching cycle while later the material transformation by virtue of a volume change in the transformed material causes large transformation stresses. The transient temperature distributions and the elastic treatment of the stresses has been treated previously. The present work is an attempt to consider the thermo-elastic-plastic aspects of the problem. The von Mises' yield criterion and the Prandtl-Reuss stress strain relations are used. Results are calculated based on a new finite difference approach.

AN EVALUATION OF FOUR CURRENT MODELS TO PREDICT THE CREEP-FATIGUE INTERACTION IN RENE 95 Technical Report, Jan. 1977 - Aug. 1978

Henry L. Bernstein. Jun. 1979 111 p refs

(Contract F33615-76-C-5191; AF Proj. 7351)

(AD-A077168; SRL-6909-TR; AFML-TR-79-4075) Avail: NTIS HC A06/MF A01 CSCL 11/6

Four current models for the creep-fatigue interaction were evaluated for their ability to predict fatigue behavior at 1200 F (650 C) of thermochemically processed Rene 95--an advanced nickel-base superalloy used for turbine disks. These models are the Strawrange-Partitioning Model, the Frequency-Separation Model, the Ostergren Model, and the Damage-Rate Model. A series of strain controlled fatigue tests was conducted to evaluate these models. These tests consisted of continuously cycling tests at two different frequencies, various types of strain-hold tests, and dual-rate continuously cycling tests. These fatigue tests were divided into two groups--baseline tests and verification tests. The baseline tests were used to determine the constants in the models and the correlation ability of the models. The verification tests were used to determine the predictive ability of the models. The best correlation of the baseline tests was to within a scatter band of plus or minus 3.6 and was achieved by the Frequency-Separation Model and the Ostergren Model. The other two models had scatter bands greater than plus or minus 5. The best prediction of the verification tests was to within a factor of plus 5.2 and was achieved by the Ostergren Model. The other models predicted the verification tests from factors of plus or minus 6.1 to plus or minus 18. Each of the models consistently overpredicted or underpredicted the lives of certain types of tests that form the data base. Based upon the results of this study, it was concluded that these models in their present form could not adequately predict the fatigue life of Rene 95 at 1200 F (650 C).

ON THE LOAD DISPLACEMENT RELATION FOR A CRACKED RECTANGULAR SPECIMEN WITH CONSTRAINED ENDS Final Report

Oscar L. Bowie and Francis I. Baratta. Jul. 1979 17 p refs

Submitted for publication

(DA Proj. 1L1-62105-AH-84)

(AD-A075527; AMMRC-TR-79-46) Avail: NTIS HC A02/MF A01 CSCL 20/11

Relations are presented between the net force, the end displacement, and the stress intensity factor for cracked rectangular panels subjected to uniform displacement. Two configurations are considered: an edge-cracked panel and a

center-cracked panel. If the stress intensity factor is already known in terms of the normal displacement, then the resulting formulation allows the determination of that stress intensity in terms of the applied load and vice versa. GRA

THE PREDICTION OF MASS LOADED NATURAL FREQUENCIES AND FORCED RESPONSE OF COMPLEX, RIB-STIFFENED STRUCTURES M.S. Thesis
L. B. Glensek. Dec. 1979. 149 p. refs.
(AD-A079856; AFIT/GAE/AA/79D-5) Avail: NTIS
HC A07/MF A01 CSCL 20/4

An experimental investigation was conducted to determine the validity of an algorithm developed by Whaley (Ref. 14) to approximate the natural frequencies of a complex structure under arbitrary mass loading conditions, when only the unloaded natural frequency and mode shape data is known. The chosen test specimen was a curved, rib-stiffened panel from a C-141 Starlifter, aircraft. The panel was suspended from the ceiling by bungy cords and tested in an unloaded configuration and nine separate mass loaded configurations. Then using only unloaded data the generalized mass and generalized stiffness for each mass loaded configuration were computed, and the natural frequencies for each configuration were computationally predicted using the aforementioned algorithm. The theoretical and experimental results were then compared to detemine the amount of error incurred in the approximation technique. The theory of how to ultimately determine the overall forced response of the specimen was discussed and an error model was developed to enable an examination of the reliability of the algorithm in predicting forced response. Recommendations concerning future test procedures, areas requiring further study, and the use of the algorithm were made. GRA

ENERGY RELEASE RATE CALCULATIONS FOR INTERFACE EDGE CRACKS BASED ON A CONSERVATION INTEGRAL Summary Report
A. Nachman (Old Dominion Univ.) and J. R. Walton (Texas A and M Univ., College Station). Nov. 1979. 14 p. refs.
(Contracts DAAG29-75-C-0024; F49620-79-C-0076; Grant AF-AFOSR-3290-77)
(AD-A079723; MRC-TSR-2017) Avail: NTIS
HC A02/MF A01 CSCL 12/1

A certain conservation integral, the so called M-integral, recently exploited by L. B. Freund in the calculation of stress intensity factors for cracks in homogeneous elastic media, is applied to the calculation of energy release rates for interface edge cracks. Specifically, for an edge crack along the interface between two elastic wedges of different opening angles and dissimilar elastic properties, and that is subjected to point loads at the apex, a relation is derived among the length of the crack, the energy release rate of the crack, the applied loads, the wedge angles and the material parameters. EFFECT OF IMPERFECTIONS ON THE COLLAPSE OF RECTANGULAR PLATES USING VARIATIONAL CALCULUS M.S. Thesis
Lyle G. Peck. Dec. 1979. 73 p. refs.
(AD-A079905; AFIT/GAE/AA/79D-14) Avail: NTIS
HC A04/MF A01 CSCL 11/4

An analysis is made of the effect of initial imperfections in geometry on the collapse of simply-supported rectangular plates. A Reissner-type variational principle is employed to evaluate the load versus lateral displacement of elastic, elastic-plastic and orthotropic plates subject to compressive loading along two edges. Imperfection size and shape, plate thickness and aspect ratio, and for orthotropic material, the ply orientation is examined. The results indicate that the load-displacement curve is sensitive to the initial imperfection, particularly for elastic-plastic materials. The effect of plate size and aspect ratio are similar for all the plates considered with the collapse stresses higher for elastic plates than for elastic-plastic plates. The effect of plasticity becomes insignificant for thin plates when compared with plates with elastic properties. In general, it can be stated that the imperfection function determines the plate's collapse load. For orthotropic plates the effect of ply orientation is significant at aspect ratios less than 1 but relatively insignificant at higher values when comparing the minimum collapse stresses. The difference is dependent upon the magnitude of the ratio of Young's moduli in the major material axes. GRA

ANALYTICAL/EXPERIMENTAL INVESTIGATION OF THE INSTABILITY OF COMPOSITE CYLINDRICAL PANELS M.S. Thesis
Marvin L. Becker. Dec. 1979. 89 p.
(AD-A079850; AFIT/GAE/AA/79D-3) Avail: NTIS
HC A05/MF A01 CSCL 11/4

An analytical and experimental program was conducted to study the instability of 8-ply laminated cylindrical panels (graphite-epoxy) subjected to an axial compressive loading. The analysis included three different ply orientations, five different boundary conditions on the vertical edges, and three different panel sizes. The analytical buckling loads were obtained by using the linear bifurcation branch of the STAGS-C computer code, and several nonlinear collapse analyses were also made on selected configurations. The experimental tests were conducted by the Air Force Flight Dynamics Laboratory using a specially designed test fixture. Relatively good agreement was obtained between the analytical and experimental buckling loads, particularly when the nonlinear collapse load was used. The linear bifurcation results were 11 - 28% higher than the nonlinear results, indicating that the nonlinear effects in circular composite panels are important. The boundary conditions (especially w and v) had the greatest influence on the buckling load, followed by the aspect ratio and finally the ply orientation. The (+ or - 45)2s panels exhibited an unusually large increase in the buckling load when the aspect ratio was small and the in-plane displacements were restrained at the edges. GRA

COLUMN BUCKLING OF ISOTROPIC AND COMPOSITE BEAMS USING A TRUNCATED FOURIER SERIES M.S. Thesis
J. Louis Insprucker, III. Dec. 1979. 139 p. refs.
(AD-A079862; AFIT/GA/AA/80M-2) Avail: NTIS
HC A07/MF A01 CSCL 13/13

A trigonometric approach to finite difference calculus was applied to solve for beam buckling loads using a virtual work method. The trigonometric equation, a truncated Fourier series, permitted varying the buckling load by adjusting a wavelength parameter. Values for the buckling load of a variety of beams - uniform, homogeneous, variable and discontinuous inertias, composite - were found under a wide range of boundary conditions. An optimization scheme was used which determines the critical load by locating the intersection of two buckling load curves. The method is accurate as long as points of interest - maximum inertia, discontinuities - are modeled by the nodal arrangement. The trigonometric approach provided improved accuracy over the conventional approach for a wide range of wavelengths. For an infinite value of the wavelength, the trigonometric approach converges to the conventional one. A variable mesh designed to concentrate nodes about points of interest was found to be relatively ineffective when compared to a uniform mesh. Composite materials were modeled using an equivalent flexural rigidity. GRA

RIGID-PLASTIC FINITE-ELEMENT ANALYSIS OF PLASTIC DEFORMATION IN METAL-FORMING PROCESSES Progress Report, May 1978 - May 1979
C. C. Chen and Shiro Kobayashi. Aug. 1979. 141 p. refs.
(Contract F33615-77-C-5111; AF Proj. 2418)
(AD-A078987; AFML-TR-79-4105) Avail: NTIS
HC A07/MF A01 CSCL 13B

Metal-forming processes of extrusion, drawing, ring compression, and closed-die forging were analysed by the rigid-plastic finite-element method. According to the individual problem

characteristics, the method was modified in order to deal with the steady-state configurations of the extrusion and drawing problems, the neutral flow point (or region) problems of ring compression, and the complexity in geometric changes of the closed-die forging problems. The present investigation is a complete study of the axisymmetric steady-state extrusion and drawing processes, including multipass extrusion and drawing. Detailed deformation mechanics were revealed, showing the influence of the previous deformation history on the flow pattern in the current pass. To solve the neutral flow problems in ring compression, a variational formulation was developed for the case where the frictional stress is dependent on the relative velocity at the die-workpiece interface. The finite-element solutions of ring compression were then obtained under various friction conditions for several materials. Some of the results were compared with the approximate theoretical solutions and experimental results. It was concluded that this modified finite-element scheme does provide a useful tool for the analysis of neutral flow problems and for industrial applications. The closed-die forging problems are characterized by very complex geometries, large rigid portions, and rapid changes in velocity fields. GRA

Water migration across the thin epoxy resin layer in model adhesive joints causes strongly inhomogeneous swelling. The swelling is the principal cause of stress systems which are being examined by analysis of the pattern of Newton's rings formed between a glass cover slip and an optical flat. Enhancement of water migration by normal stresses fracture mechanics test piece, designed to investigate water uptake by adhesives, is reported. Photoelastic imaging of ultrasonic waves can be utilized to investigate defects in opaque solids. Instead of using a piezoelectric detector, the reflected sound from a defect is actually observed in a visualizing block of quartz, after propagating from the specimen to the block across an acoustic coupling. Experiments and a computer model are described. GRA

DISTRIBUTION OF STEADY STATE TEMPERATURES AND THERMOELASTIC STRESSES IN CYLINDRICAL SHELL WITH INTERNAL HEAT GENERATION AND COOLED ON BOTH SIDES OR ONLY ON ONE SIDE
Gilbert B. MeleseDHospital Oct. 1979 80 p
(Contract DE-AT03-76ET-35300)
(GA-A-15509) Avail: NTIS HC A05/MF A01

General expression for steady state temperatures and elastic thermal stress distribution are derived for a hollow fuel element cooled on both sides. The main simplifying assumptions consist of one dimensional heat transfer and a single medium. Dimensionless numerical results are plotted in the case of uniform internal heat generation and for constant thermal conductivity. Solid rods and flat plates are treated as special cases. As could be expected, cooling on both sides rather than on only one side, leads to significant reduction in maximum fuel temperature and thermal stresses for a given power density, or to a significant increase in power density for either given maximum temperature drop in the fuel or for maximum tensile thermal stress. DOE

MATERIALS AND MECHANICS OF RATE EFFECTS IN BRITTLE FRACTURE Progress Report, Oct. 1978 - Oct. 1979
S. J. Burns Oct. 1979 19 p
(Contract EY-76-S-02-2422)
(COO-2422-22) Avail: NTIS HC A02/MF A01

A thermodynamic formulation for a crack driving force was experimentally used in linear elastic fracture mechanics, elastic plastic fracture mechanics and creep fracture. In linear elastic and elastic plastic fracture mechanics, mechanical stability criteria are established from the load versus the load point displacement in two test specimens that differ only in crack area. These tests were also used to measure the fracture toughness in several heat treated steels. Creep cracking of PMMA shows that there is a sharp transition to unstable fracture in a plot of the log of the steady state crack velocity versus the crack driving force at several selected temperatures. In addition, it is shown that the athermal crack driving force is independent of rate and temperature. A method for electronically recording the crack driving force versus the crack area was used on double cantilevered beam specimens. Temperature and crack rate dependences were measured near the ductile to brittle transition temperature in a low carbon steel. DOE

CONTRIBUTIONS TO THE UTILIZATION OF ALTIMETER DATA [ARBEITEN ZUR NUTZUNG VON ALTIMETERDATEN] c46

Dieter Lelgemann *In its* Rept. on Cartography and Geodesy. Ser. 1: Original Rept. No. 73 1977 p 81-85 refs In GERMAN (For primary document see N80-20638 11-42)

Avail: NTIS HC A11/MF A01

The geodetic use of high precision altimeters is examined. Radars placed in artificial satellites contribute to the determination of a global coordinate system and the knowledge of the characteristics of the graviational field. The Hudson Bay project with five observation stations and the short-arc method used for equalization are described briefly. Author (ESA)

N80-20645# Institut fuer Angewandte Geodaesie, Frankfurt am Main (West Germany).

ELABORATION OF THE TIME SYSTEM OF THE SATELLITE OBSERVATION STATION WETTZELL FROM 1972-1977 [DER AUFBAU DES ZEITSYSTEMS DER SATELLITENBEOBACHUNGSSTATION WETZELL IN DGN JAHREN 1972-1977)] c35

Klemens Nottarp and Ingo Zeitel *In its* Rept. on Cartography and Geodesy. Ser. 1: Original Rept. No. 73 1977 p 87-91 .efs In GERMAN (For primary document see N80-20638 11-42)

Avail: NTIS HC A11/MF A01

The different techniques for time measurement used by the IFAG are described. Narrower time intervals used to be determined as the techniques of distance measurement developed. The progressive definition of the standard frequency and the improvements of timing devices are elaborated. Results obtained from collaborating stations are compared and discussed. A synchronization precision should reach five nanoseconds. Author (ESA)

N80-20646# Institut fuer Angewandte Geodaesie, Frankfurt am Main (West Germany).

PARTICIPATION OF SATELLITE OBSERVATION STATION WETZELL IN INTERNATIONAL OBSERVATION PROGRAMS, 1976-1977 [ZUR BETEILIGUNG DER SATELLITENBEOBACHTUNGSSTATION WETZELL AN INTERNATIONALGEN

BEOBACHTUNGSPROGRAMMEN (1975-1977)] **c14**
Hermann Seeger and Peter Wilson *In its* Rept. on Cartography and Geodesy. Ser. 1: Original Rept. No. 73 1977 p 93-103 refs In GERMAN (For primary document see N80-20638 11-42)
Avail: NTIS HC A11/MF A01

The participation of the Wetzell satellite observation station in international observation programs from 1975 to 1977 is reported. Observations of the GEOS satellites from Wettzell and other stations, C-band radar measurements, the European Doppler measurment campaign EDOC 1 and 2, and the European laser distance measurement campaign are briefly reviewed.

ELABORATING AN ASTRONOMICAL LONGITUDE SYSTEM [ARBEITEN AM ASTRONOMISCHEN LAENGENNETZ]
Gerhard Soltau *In its* Rept. on Cartography and Geodesy. Ser. 1: Original Rept. No. 73 1977 p 105-109 refs In GERMAN (For primary document see N80-20638 11-42)
Avail: NTIS HC A11/MF A01

The problem of astronomical longitude determination is examined. Systematic local variations in the astronomical longitude system are due to the consistency of the initial point. Relative longitude systems combination of these relative systems, comparing traditional geodetic and satellite methods eliminates errors and leads to a longitude systems homogeneous over Western Europe.
Author (ESA)

N80-20648# Institut fuer Angewandte Geodaesie, Frankfurt am Main (West Germany).
DETERMINATION OF AZIMUTH AND ASTRONOMICAL COORDINATES **c43**
Gerhard Soltau *In its* Rept. on Cartography and Geodesy. Ser. 1: Original Rept. No. 73 1977 p 111-115 refs In GERMAN (For primary document see N80-20638 11-42)
Avail: NTIS HC A11/MF A01

The determination of astronomical coordinates and azimuth from Laplace stations is examined. Observations from stations examining the vertical variation are discussed. A precision of 5 min. of arc can be reached for each component. A greater density of points will contribute more to precision than will improvements in the measurement possibilities.
Author (ESA)

N80-20649# Institut fuer Angewandte Geodaesie, Frankfurt am Main (West Germany).
DETERMINATION OF VARIATIONS OF TIME DEPENDENT COORDINATES THROUGH ASTRONOMICAL AND DOPPLER OBSERVATIONS [ZEITABHAENGIGE KOORDINATENAENDERUNGEN, BESTIMMT DURCH ASTRONOMISCHE BEOBACHTUNGEN UND DURCH DOPPLERBEOBACHTUNGEN] **c46**
Wolfgang Schlueter *In its* Rept. on Cartography and Geodesy. Ser. 1: Original Rept. No. 73 1977 p 117-120 refs In GERMAN (For primary document see N80-20638 11-42)
Avail: NTIS HC A11/MF A01

Variations in time dependent astronomical positioning determined by circumzenithal and by Doppler measurements are described. These variations are either determined physically from polar movement and earth crust deformations, or related to systematic experimental errors on the star coordinates or derived from experimental error. An error analysis compared circumzenithal observations and Doppler observations. Among others, an advantage of Doppler observations lies in its higher precision, its independence from weather, and automatic measuring capability.

ORTHOPHOTO TECHNIQUES AND PHOTOMAPS [ORTHOPHOTOTECHNIK UND LUFTBILDKARTE] c43
Rudolf Olach *In its* Rept. on Cartography and Geodesy. Ser. 1: Original Rept. No. 73 1977 p 199-201 refs In GERMAN (For primary document see N80-20638 11-42)
Avail: NTIS HC A11/MF A01

The orthophototechnique and the development of orthophotoplans and aerial photographic maps is examined. Precision in orthophotographic techniques, the applications of orthophotoplans and their structure are described. Author (ESA)

N80-20667# Institut fuer Angewandte Geodaesie, Frankfurt am Main (West Germany).
AERIAL AND SPACE-BORNE PHOTOGRAPHIC MAPS [LUFTBILD UND WELTRAUMBILDKARTEN] c43
Heinz Schmidt-Falkenberg *In its* Rept. on Cartography and Geodesy. Ser. 1: Original Rept. No. 73 1977 p 203-210 refs In GERMAN Original contains color illustrations (For primary document see N80-20638 11-42)
Avail: NTIS HC A11/MF A01

The production of topographic aerial photography and spaceborne photomaps is described. Aerial photomaps are produced from orthophotographs with additional cartographic information. Rapid execution of photomaps, and difficulties of scale reduction by classical or automatic means are mentioned as justification for aerial and spaceborne photographic mapping. Author (ESA)

N80-20668# Institut fuer Angewandte Geodaesie, Frankfurt am Main (West Germany).
OBTAINING SURFACE INFORMATION FOR TOPOGRAPHY AND TOWN AND COUNTRY PLANNING FROM REMOTE SENSING [DAS GEWINNEN VON FLAECHENNUTZUNGS INFORMATIONEN MITTELS FERNERKUNDUNGSVERFAHREN FUER AUFGABEN DGR TOPOGRAPHIE UND DER LANDESPLANUNG] c43
Klaus Niemz *In its* Rept. on Cartography and Geodesy. Ser. 1: Original Rept. No. 73 1977 p 211-217 In GERMAN Original contains color illstrations (For primary document see N80-20638 11-42)
Avail: NTIS HC A11/MF A01

Methods developed for future Earth reconnaissance flights are described and discussed. Four test regions with different characteristics were selected: test region 1 (North Germany) for oceanic and coastal studies; test region 2 (Lower Main/Taunus/Wetterau) for town and country planning applications; test region 3 (Upper Rhine/Black Forest) for vegetation and forestry applications; test region 4 (Baltic region) for geological applications. Results obtained with a Bendix-11-channel scanner are presented and compared with LANDSAT 2 data. Different crops and land uses are characterized by color separation utilizing the DIBIAS system and the maximum likelihood method. Author (ESA)

N80-20669# Institut fuer Angewandte Geodaesie, Frankfurt am Main (West Germany).
DIGITAL HEIGHT MODEL WITH ITEK CORRELATOR [DIGITALES HOEHENMODELL MIT DEM ITEK KORRELATOR] c43
Gerhard Lindig *In its* Rept. on Cartography and Geodesy. Ser. 1: Original Rept. No. 73 1977 p 219-223 refs In GERMAN (For primary document see N80-20638 11-42)
Avail: NTIS HC A11/MF A01

Emphasis is given to the utilization of this model in the restitution of orthophotos. The most important factors taken into consideration include: determination of heights as accurately as possible; obtaining the least possible drop in correlation; rapid extraction of correlation; avoidance or domination of Floats; avoidance or recognition of Swings; elimination of systematic adaptation of parameters to different local conditions; filling in correlation loss gaps. It is concluded that the ITEK correlator EC5 can greatly contribute to the obtaining of height information for the orthophoto and also for height line maps. Author (ESA)

N80-20670# Institut fuer Angewandte Geodaesie, Frankfurt am Main (West Germany).
THE FUTURE OF ANALYTICAL EVALUATION EQUIPMENT [ERWARTUNGEN AN ANALYTISCHE AUSWERTEGERAETE] c43
Karl Schuerer *In its* Rept. on Cartography and Geodesy. Ser. 1: Original Rept. No. 73 1977 p 225-227 refs In GERMAN (For primary document see N80-20638 11-42)
Avail: NTIS HC A11/MF A01

Developments in image measurement techniques are covered with emphasis on comparators and analog evaluation techniques. Advantages and disadvantages found in both techniques are considered. The feasibility of an apparatus incorporating the advantages of both systems and computer technology is addressed. Applications in practical photogrammetry and in the field of research are included. Author (ESA)

N80-20671# Institut fuer Angewandte Geodaesie, Frankfurt am Main (West Germany).
DIGITAL MAP BASES FROM PHOTOGRAMMETRIC MEASUREMENTS [DIGITALE KARTENGRUNDLAGEN AUS PHOTOGRAMMETRISCHEN MESSUNGEN] c43
Hermann G. Neubauer *In its* Rept. on Cartography and Geodesy. Ser. 1: Original Rept. No. 73 1977 p 229-231 In GERMAN (For primary document see N80-20638 11-42)
Avail: NTIS HC A11/MF A01

Progress in electronic data processing has led to the development of accurate automated equipment for the production of all types of maps, systems, in which out-of-date information is eliminated and new objects, of particular interest, are introduced. Various calculation procedures associated with the transfer of measured data to digital maps are indicated: adaptation to the map's coordinate system; division of stereogram areas into areas of similar usage; association of measurements from adjacent stereograms; incorporation of modifications from field comparisons; preparation of data for storage in data banks. The automatic generation of height lines from discrete points is discussed. The corresponding coloration of different cultures can also be handled in this way. Author (ESA)

N80-20672# Institut fuer Angewandte Geodaesie, Frankfurt am Main (West Germany).
TASKS AND POSSIBILITIES OF DIGITAL IMAGE DATA PROCESSING IN PHOTOGRAMMETRY [AUFGABEN UND MOEGLICHKEITEN DGR DIGITALEN BILDVERARBEITUNG IN DGR PHOTOGRAMMETRIE] c43
Bernd-Siegfried Schulz *In its* Rept. on Cartography and Geodesy. Ser. 1: Original Rept. No. 73 1977 p 233-235 In GERMAN (For primary document see N80-20638 11-42)
Avail: NTIS HC A11/MF A01

A technique to accelerate fabrication and improve the quality of topographic maps made from primary data is described. Applications include remote sensing from aircraft and satellites. The treatment of data from LANDSAT 1, 2, and 3 is discussed. Optical and geometrical effects are corrected and contrast enhanced. High sensitivity is achieved enabling various surface coverages to be identified and studied in detail (different types of region, forests, geographical, and geological features). Correlations between different parts of a single image and between different images are studied and exploited. Author (ESA)

N80-20673# Institut fuer Angewandte Geodaesie, Frankfurt am Main (West Germany).
AIRPORT OBSTACLE MAPS [FLUGPLATZ HINDERNISKARTEN] c43
Heinz Bannach *In its* Rept. on Cartography and Geodesy. Ser. 1: Original Rept. No. 73 1974 p 237-240 In GERMAN (For primary document see N80-20638 11-42)
Avail: NTIS HC A11/MF A01

The application of photogrammetry to the study of the effects of obstacles on a aircraft takeoff and landing is considered with emphasis on safety. Observation clearance limits required by the International Civil Aviation Organization are discussed along with regulations in force in Germany. A technique utilizing a high precision stereocomparator to determine the heights of various

man-made and natural objects is described. The way in which the measurements are made and interpreted is presented as a function of the real conditions prevailing. A practical example is given. Author (ESA)

N80-20674# Institut fuer Angewandte Geodaesie, Frankfurt am Main (West Germany).
REPORTS ON CARTOGRAPHY AND TOPOGRAPHICAL MEASUREMENTS. SERIES 1: ORIGINAL REPORT NO. 74 [NACHRICHTEN AUS DEM KARTEN- UND VERMESSUNGSWESEN. REIHE 1: ORIGINALBEITRAEGE HEFT NR. 74]
1978 78 p refs In GERMAN; ENGLISH summary
(Rept-74) Avail: NTIS HC A05/MF A01

Subjects dealt with in four separate papers are: (1) a computerized treatment of displacements on topographical maps of the Federal Republic of Germany (FRG) which frees the cartographer from certain routine tasks; (2) aerial photography of the FRG and West Berlin (flight details are given together with documentation on existing photographs); (3) the equipping of a special symbol disk with interchangeable symbols and its accuracy in cartographic work; and (4) data reduction as well as line generalization problems in cartography as optimization tasks. Five books treating communication problems, field and laboratory geomorphological studies, and other cartography problems are reviewed. For individual titles, see N80-20675 through N80-20678.

N80-20675# Institut fuer Angewandte Geodaesie, Frankfurt am Main (West Germany).
ON THE DISPLACEMENT PROBLEM AS PART OF A PROCESS IN GENERALIZING TOPOGRAHICAL MAPS. PROPOSITION FOR HIERARCHICAL ORDER AND THE SEARCH FOR EDP ASSISTED SOLUTIONS [ZUM PROBLEM DER VERDRAENGUNG ALS TEILVORGANG DER GENERALISIERUNG TOPOGRAPHYISCHER KARTEN. HIERARCHIEVORSCHLAG UND VERSUCH EINER EDV-GESTUETZTEN LOESUNG] **c43**
Roland Schittenhelm *In its* Rept. on Cartography and Topographical Meas. Ser. 1: Original Rept. No. 74 1978 p 5-19 refs In GERMAN; ENGLISH summary (For primary document see N80-20674 11-42)
Avail: NTIS HC A05/MF A01

Based on the results obtained from the investigation of practical cases of displacement on official maps of Germany, an order is proposed for map elements which could be observed during displacement. Solutions are given for three line element displacement cases (displacement by a compulsory point, displacement by a further element which is broadened or displaces itself, disentanglement of double hairpin bends of curved and broadened line elements). These have the advantage of freeing the cartographer from many routine tasks. Author (ESA)

N80-20676# Institut fuer Angewandte Geodaesie, Frankfurt am Main (West Germany).
TWENTY-FIVE YEARS OF AERIAL PHOTOGRAPHY BY THE INSTITUTE OF APPLIED GEODESY [JAHRE LUFTBILDNACHWEIS DES INSTITUTS FUER ANGEWANDTE GEODAESIE] **c43**
Heinz Schmidt-Falkenberg *In its* Rept. on Cartography and Topographical Meas. Ser. 1: Original Rept. No. 74 1978 p 21-38 refs In GERMAN; ENGLISH summary (For primary document see N80-20674 11-42)
Avail: NTIS HC A05/MF A01

After a short survey of aerial photography developments in Germany after the Second World War, some details are given about the aerial photography documentation which the institute possesses. Information is also given about the number and frequency of photo flights over a period of ten years. A detailed list of aerial photographs of the German estates is presented together with a list of aerial photography archives existing in Germany. Author (ESA)

N80-20677# Institut fuer Angewandte Geodaesie, Frankfurt am Main (West Germany).
A SYMBOL DISK WITH INTERCHANGEABLE SYMBOLS AND ITS APPLICATIONS TO CARTOGRAPHY [EINE SYMBOLSCHEIBE MIT AUSWECHSELBAREN SYMBOLEN UND IHRE EINSATZMOEGLICHKEIT IN DER KARTOGRAPHIE] **c43**
Helmut Uhrig *In its* Rept. on Cartography and Topographical Meas. Ser. 1: Original Rept. No. 74 1978 p 39-53 refs In GERMAN; ENGLISH summary (For primary document see N80-20674 11-42)
Avail: NTIS HC A05/MF A01

A simple disk system that is both accurate and easily modifiable was sought. The system developed possesses 72 symbols which can be positioned by the user employing the cut and peel process or a technical method of reproduction. Specially positioned studs and holes assure that the disk is correctly centered, that the masks are in the right position, and that the unwanted part of the disk is correctly covered. A water distribution map is taken as an example. The maximum positioning error on the map itself resulting from the use of this technique is 32 microns. Author (ESA)

LINE GENERALIZATION AND DATA REDUCTION FROM A MATHEMATICAL OPTIMIZATION POINT OF VIEW [LINIENGENERALISIERUNG UND DATENREDUKTION UNTER DEM GESICHTSWINKEL DER MATHEMATISCHEN OPTIMIERUNG] **c61**
Wigand Weber *In its* Rept. on Cartography and Topographical Meas. Ser. 1: Original Rept. No. 74 1978 p 55-66 refs In GERMAN; ENGLISH summary (For primary document see N80-20674 11-42)
Avail: NTIS HC A05/MF A01

Two solutions are described. In the first, a polygonal substitute for the original curve is sought, the control points of which lie within a tolerable lateral distance range from the original curve; the maximum value of this range is constant for data reduction and self adapting with respect to local information density behavior for generalization. In the second, a rigorous formula using the lateral distances between successive points on the original curve and a reference line is used. Author (ESA)

REPORTS ON CARTOGRAPHY AND TOPOGRAPHICAL MEASUREMENTS. SERIES 2: TRANSLATIONS
1978 127 p refs
(Rept-35) Avail: NTIS HC A07/MF A01

Eleven texts are presented concerning automated displacement of point and line features in cartographic generalization, a digital terrain model for large surfaces and direct storage access, photomapping tidal flat areas, testing the accuracy of cartographic equipment, color separation, locational characteristics and computer assisted cartographic generalization, computer assisted thematic mapping, digitizing geometric data for thematic mapping, and some programs for the transformation of the contents of available maps according to different map projections. For individual titles, see N80-20680 through N80-20690.

N80-20680# Institut fuer Angewandte Geodaesie, Frankfurt am Main (West Germany).
A PROGRAM FOR THE FULLY AUTOMATED DISPLACEMENT OF POINT AND LINE FEATURES IN CARTOGRAPHIC GENERALIZATION **c43**
Fred Christ *In its* Rept. on Cartography and Topographical Meas. Ser. 2: Transl. 1978 p 5-30 refs (For primary document see N80-20679 11-42)
Avail: NTIS HC A07/MF A01

A program for the fully automated displacement of point and line features in cartographic generalization is described. The basic algorithm is a correlation of the displacement effects of the features when deriving a small scale map from a large scale map. Raster based processing is used. K.L.

N80-20681# Institut fuer Angewandte Geodaesie, Frankfurt am Main (West Germany).
A DIGITAL TERRAIN MODEL FOR LARGE SURFACES AND DIRECT STORAGE ACCESS **c43**
Rainer Detering *In its* Rept. on Cartography and Topographical Meas. Ser. 2: Transl. 1978 p 31-34 refs (For primary document see N80-20679 11-42)

Avail: NTIS HC A07/MF A01

A digital terrain model based on an equidistant grid structure which uses nonlinear interpolation while storing numerical values of elevations and slopes is proposed. The model, characterized by its high storage capacity and universality, is based on bicubic spline functions. The mathematically exact solution of a common adjustment in the total domain of definition is limited in favor of a pointed interactive change of input data. Author (ESA)

N80-20682# Institut fuer Angewandte Geodaesie, Frankfurt am Main (West Germany).

THE PRODUCTION OF PHOTOMAPS FROM TIDAL FLAT AREAS **c43**

Guenter Hake *In its* Rept. on Cartography and Topographical Meas. Ser. 2: Transl. 1978 p 35-41 refs (For primary document see N80-20679 11-42)

Avail: NTIS HC A07/MF A01

Clearly visible water lines from a series of infrared aerial photographs taken at the time of rising tides in tidal flat areas are digitized and transformed into contours by the allocation of individual elevation values. The cartographic combination of the contour representation and rectified aerial photographs from the time of the lowest water level leads to a photomap with a very high information content. Changes in elevation and volume can be calculated from subsequent photographs. Author (ESA)

N80-20683# Institut fuer Angewandte Geodaesie, Frankfurt am Main (West Germany).

TESTING THE ACCURACY OF CARTOGRAPHIC EQUIPMENT: FIRST RESULTS **c43**

Theodor Johannsen *In its* Rept. on Cartography and Topographical Meas. Ser 2: Transl. 1978 p 43054 refs (For primary document see N80-20679 11-42)

Avail: NTIS HC A07/MF A01

Different methods of testing digitizers and plotters were developed and verified. Apart from simple tests (without the use of any additional equipment), profiles were measured with high precision using a laser interferometer. In addition, a technique was developed to establish the errors introduced by an operator when manually guiding the cursor for digitizing. It is concluded that absolute scale measurements and accurate local tests require equipment with resolution and accuracy exceeding those of the instrument to be measured by at least an order of magnitude. Author (ESA)

N80-20684# Institut fuer Angewandte Geodaesie, Frankfurt am Main (West Germany).

ADP-SUPPORTED COLOR SEPARATION **c74**

Hans Kern *In its* Rept. on Cartography and Topographical Meas. Ser. 2: Transl. 1978 p 55-64 (For primary document see N80-20679 11-42)

Avail: NTIS HC A07/MF A01

Automated color separation is treated as a special topic of thematic computer cartography. Its aim is to develop a procedure satisfying the highest demands for quality and precision while flexibly treating the question of whether a map should be drafted in color or in black and white. A scheme for integrating computer cartography into spatial analysis processes is discussed. Algorithms are presented which provide an ample variety of hatching for any type of area and prevent the overlapping of thematic symbols. Hatching identifications and color indices are introduced. Author (ESA)

N80-20685# Institut fuer Angewandte Geodaesie, Frankfurt am Main (West Germany).

LOCATIONAL CHARACTERISTICS AND THE SEQUENCE OF COMPUTER ASSISTED PROCESSES OF CARTOGRAPHIC GENERALIZATION **c43**

Werner Lichtner *In its* Rept. on Cartography and Topographical Meas. Ser. 2: Transl. 1978 p 65-75 refs (For primary document see N80-20679 11-42)

Avail: NTIS HC A07/MF A01

A sequence of generalization processes for computer assisted operation is proposed which is intented to avoid both repetition of processes and frequent correction during batch compilation with the aid of interactive optical display systems. Particular attention is given to effects producing a lack or an excess of space and to locational changes in features and phenomena. Specific examples involving buildings and roads are discussed, as are displacement processes and the smoothing of contours and other linear phenomena. Good results are obtained with this method which has the advantage of homogeneity over manual methods. Author (ESA)

N80-20686# Institut fuer Angewandte Geodaesie, Frankfurt am Main (West Germany).

COMPUTER-ASSISTED THEMATIC MAPPING FOR FEDERAL PLANNING **c43**

Wolf-Dieter Rase *In its* Rept. on Cartography and Topographical Meas. Ser. 2: Transl. 1978 p 77-83 refs (For primary document see N80-20679 11-42)

Avail: NTIS HC A07/MF A01

To satisfy the needs for thematic maps on different levels of quality and quantity, computer assisted techniques were implemented in the map production process. Choropleth, graduated symbol, and other map types are plotted on an in-house minicomputer system with graphic peripherals. Remarks on the economic efficiency of computer assisted thematic cartography supplement the technical information. Author (ESA)

N80-20687# Institut fuer Angewandte Geodaesie, Frankfurt am Main (West Germany).

DIGITIZING OF GEOMETRIC DATA FOR THEMATIC MAPPING: STATE-OF-THE-ART AND FUTURE DEVELOPMENTS **c43**

Klaus Tuerke *In its* Rept. on Cartography and Topographical Meas. Ser. 2: Transl. 1978 p 85-91 refs (For primary document see N80-20679 11-42)

Avail: NTIS HC A07/MF A01

The cartographic data structures suitable for thematic computer mapping are surveyed and the data formats and digitizing procedure used in a production oriented environment are described in detail. Presently, interactive digitizing by experienced cartographic personnel is the most economic way of generating a geometric data base; improved techniques of automatic data acquisition, however, will shift the cartographer's function from mass data encoding to interactive correction, generalization, and administration of scanned data. Author (ESA)

N80-20688# Institut fuer Angewandte Geodaesie, Frankfurt am Main (West Germany).

EXPERIENCES GATHERED WITH A SYMBOL DISK WITH INTERCHANGEABLE SYMBOLS **c61**

Helmut Uhrig *In its* Rept. on Cartography and Topographical Meas. Ser. 2: Transl. 1978 p 93-106 refs (For primary document see N80-20679 11-42)

Avail: NTIS HC A07/MF A01

A simple disk system that is both accurate and easily modifiable was sought. The system developed possesses 72 symbols which can be positioned by the user employing the cut and peel process or a technical method of repoduction. Specially positioned studs and holes assure that the disk is correctly centered, that the masks are in the right position, and that the unwanted part of the disk is correctly covered. A water distribution map is taken as an example. The maximum positioning error on the map itself resulting from the use of this technique is 32 microns. Author (ESA)

N80-20689# Institut fuer Angewandte Geodaesie, Frankfurt am Main (West Germany).

DATA CAPTURE FOR CARTOGRAPHIC DATA BASES **c60**

Helmut Uhrig *In its* Rept. on Cartography and Topographical Meas. Ser. 2: Transl. 1978 p 102-113 (For primary document see N80-20679 11-42)

Avail: NTIS HC A07/MF A01

The establishing of cartographic data bases from a 1:1 million map of the German Federal Republic showing administrative boundaries and from a world map of the same scale is described. It is concluded that only two digitizing procedures are valid; these are digitizing according to an original map of large scale or to an enlarged manuscript and digitizing 1:1. Author (ESA)

N80-20690# Institut fuer Angewandte Geodaesie, Frankfurt am Main (West Germany).

MAP PROJECTION CHANGE: SOME PROGRAMS FOR THE TRANSFORMATION OF THE CONTENTS OF AVAILABLE MAPS ACCORDING TO DIFFERENT MAP PROJECTIONS c43
Ingo Wilski *In its* Rept. on Cartography and Topographical Meas. Ser. 2: Transl. 1978 p 115-127 refs (For primary document see N80-20679 11-42)
Avail: NTIS HC A07/MF A01

Some FORTRAN programs are presented for the transformation of digitized map contents into geographical coordinates (Mercator and Lambert projections) and for the mass transformation of spherical geographical coordinates into rectangular map coordinates. Thirteen different map projections are considered, the graphical output being presented as a visual display and/or by a machine drawing. Author (ESA)

Avail: NTIS HC A09/MF A01

Parallel astronomical and satellite observations of the Navy satellite system were made to clarify systematic differences between Doppler and astronomical methods of evaluating movement of the pole and the behavior of long term Doppler measurements. Data for 18 months of observations are presented. Author (ESA)

N80-20699# Bayerische Akademie der Wissenschaften, Munich (West Germany).
COMPARISON OF ALGORITHMS FOR THE SUMMATION OF SPHERICAL PLANE FUNCTIONS [VERGLEICH VON ALGORITHMEN ZUR SUMMATION VON KUGELFLAECHENFUNKTION] c64

Michael Gerstl *In its* Res. Program 78, Satellite Geodesy Program 1978 p 81-88 refs In GERMAN; ENGLISH summary (For primary document see N80-20691 11-42)
Avail: NTIS HC A09/MF A01

Parameters related to the Earth's gravity field as expressed by sums of spherical harmonics are discussed. Algorithms to evaluate the sums are investigated. The algorithms observe the stability minimal storage requirements and the number of operations. The results obtained for the speed of the algorithms are discussed. Author (ESA)

N80-20700# Bayerische Akademie der Wissenschaften, Munich (West Germany).
PROBLEMS OF APPROXIMATION BY MEANS OF SAMPLING FUNCTIONS [ZUR PROBLEMATIK DER APPROXIMATION MITTELS SAMPLING-FUNKTIONEN] c64
Heinz Fritz Schmidt *In its* Res. Program 78, Satellite Geodesy Program 1978 p 89-101 refs In GERMAN (For primary document see N80-20691 11-42)
Avail: NTIS HC A09/MF A01

An introduction to the theory of representation of the functions by means of a system of basic functions is presented. The possibility of approximation through sampling functions and point parameters is explained. Examples of practical interpolation in a one dimensional field are provided. A verification of an approximation with sampling functions is treated, showing the problem of sampling point distribution and sampling functions as a basis for the definition of the spherical functions. Author (ESA)

N80-20701# Bayerische Akademie der Wissenschaften, Munich (West Germany).
ON THE USE OF LINES OF KERNEL FUNCTIONS FOR ORBITAL DETERMINATION [DIE NUTZUNG VON KERNFUNKTIONSREIHEN ZUR BAHNBESTIMMUNG] c13
Hermann Hauck *In its* Res. Program 78, Satellite Geodesy Program 1978 p 102-108 refs In GERMAN (For primary document see N80-20691 11-42)
Avail: NTIS HC A09/MF A01

The determination of orbits is dependent upon the solution of the Lagrangian equations for perturbation. Development of the proximity criterion of Legelmann allows a valid interpolation with the aid of kernel functions. A network of equidistant points is then set on the Earth's surface, each having a potential, the result of which is the resolution of the set problem. Author (ESA)

N80-20702# Bayerische Akademie der Wissenschaften, Munich (West Germany).
THE RGST CHAIN PROGRAM FOR THE DETERMINATION OF POTENTIAL COEFFICIENTS AND STATION COORDINATES [DIE REST-PROGRAMMKETTE FUER DIE BESTIMMUNG VON POTENTIALKOEFFIZIENTEN UND STATIONSKOORDINATEN] c43
Christoph Reigber *In its* Res. Program 78, Satellite Geodesy Program 1978 p 111-119 refs In GERMAN (For primary document see N80-20691 11-42)
Avail: NTIS HC A09/MF A01

The dynamic method of satellite geodesy uses the numerical integration of the equations of motion to determine the temporal motion in relation to its reference orbit. A computer program REST is described which permits corrections to be performed for uncertainties introduced into the equations by the relief of the Earth and the elastic parameters of the Earth, Sun, and Moon. Author (ESA)

N80-20703# Bayerische Akademie der Wissenschaften, Munich (West Germany).
MOTION OF ARTIFICIAL EARTH SATELLITES IN RELATED ORBITS [ZUR BEWEGUNG KUENSTLICHER ERDSATELLITEN IN BENACHBARTEN UMLAUFBAHNEN] c13

CONTRIBUTIONS TO THE CREATION OF A CONCLUSIVE SYSTEM OF CONCEPTS OF PHOTOGRAMMETRY AND AERIAL PHOTOGRAPH CARTOGRAPHY [BEITRAG ZUM AUFBAU EINES GESCLOSSENEN BEGRIFSSYTEMS DER PHOTOGRAMMETRIES UND DER LUFTBILDKARTOGRAPHIES] c43
Heinz Schmidt-Falkenberg *In its* Rept. on Cartography and Topographical Meas. Ser. 1: Original Rept. 1978 p 7-35 refs In GERMAN; ENGLISH summary (For primary document see N80-20705 11-42)
Avail: NTIS HC A09/MF A01

In connection with the revision of the German standard DIN 18 716 (photogrammetry and remote sensing) a review is presented of the conceptual connections within the fields of image recording, image processing and image evaluation as well as aerial photograph cartography, which is to serve as a contribution to the creation of a theoretical basis for photogrammetry and aerial photograph cartography. Author (ESA)

N80-20707# Institut fuer Angewandte Geodaesie, Frankfurt am Main (West Germany).
THE PROBLEM OF OBTAINING DATA FOR THE DIGITAL HEIGHT MODEL [PROBLEME DER DATENGEWINNUNG FUER DAS DIGITALE HOEHENMODELL] c43
Gerhard Lindig *In its* Rept. on Cartography and Topographical meas. Ser. 1: Original Rept. 1978 p 37-48 refs In GERMAN; ENGLISH summary Presented at Intern. Symp. der IGP, Komm 3, Moscow, 1978 (For primary document see N80-20705 11-42)
Avail: NTIS HC A09/MF A01

The point coordinates for the Digital Height Model were measured with the necessary accuracy by photogrammetric methods. Problems were encountered in obtaining correct ground heights for wooded and built-up areas, for breaks of slope or for large fields with poor contrast by manual as well as by

automatic scanning. These problems were solved only by improving the original data using computer techniques. Author (ESA)

N80-20708# Institut fuer Angewandte Geodaesie, Frankfurt am Main (West Germany).
A METHOD FOR EXAMINING RELATIONSHIPS BETWEEN MULTISPECTRAL DATA [EINE METHODE ZUE PRUEFUNG CON ABHAENGIGKEITEN ZWISCHEN MULTISPEKTRALEN DATEN] **c43**
Bernd-Siefgried Schulz *In its* Rept. on Cartography and Topographical Meas. Ser. 1: Original Rept. 1978 p 49-69 refs In GERMAN; ENGLISH summary (For primary document see N80-20705 11-42)
Avail: NTIS HC A09/MF A01

A method to examine multispectral vectors of characteristics with regard to significant difference applied for instance, to problems of spectral object speeration, is presented. This method differs from former procedures by using (least squares) adjustment and visual evaluation of the corrections obtained as a result. The method saves computing time and can also be applied to large quantities of data. The method is tested through the use of several examples. Author (ESA)

N80-20709# Institut fuer Angewandte Geodaesie, Frankfurt am Main (West Germany).
SETTING DATA FROM MULTISTAGE ANALYTICAL ORIENTATION [EINSTELLDATEN AUS MEHRSTUFIGEN ANALYTISCHEN ORIENTIERUNGSVORGAENGEN] **c43**
Karl Schuerer *In its* Rept. on Cartography and Topographical Meas. Ser. 1: Original Rept. 1978 p 71-84 refs In GERMAN; ENGLISH summary (For primary document see N80-20705 11-42)
Avail: NTIS HC A09/MF A01

From the angles of rotation and the base components determined during the multistage analytical orientation, setting data for different analog plotting instruments are calculated. Preliminary experience shows that these data influences the economy of analog plotting considerably. Author (ESA)

N80-20710# Institut fuer Angewandte Geodaesie, Frankfurt am Main (West Germany).
POSSIBILITIES OF APPLICATION OF LANDSAT AND SKYLAB DATA TO SMALL SCALE CARTOGRAPHY [VERWENDUNGSMOEGLICHKEITEN VON LANDSAT UND SKYLABAUFNAHMEN IN DER KLEIMASSTAEBIGEN KARTOGRAPHIES] **c43**
Klaus Niemz *In its* Rept. on Cartography and Topographical Meas. Ser. 1: Original Rept. 1978 p 85-140 refs In GERMAN; ENGLISH summary (For primary document see N80-20705 11-42)
Avail: NTIS HC A09/MF A01

The possibility of producing small scale topographic maps from the 70 mm film taken from Skylab and multispectral scanner data from LANDSAT is discussed. Maps with scales from 1:100,000 to 1:2,800,000 are considered. The production equipment is described. Author (ESA)

ON A MATHEMATICAL MODEL FOR REMOTE SENSING ALTIMETRY **c43**
D. Leglemann *In its* Inform. Relative to Cartography and Geodesy. Ser. 2: Transl. p 35-42 refs Presented at 1st Gen. Assem. of European Assoc. Sensing Lab., Strasbourg, 23-24 Mar. 1977 (For primary document see N80-20714 11-42)
Avail: NTIS HC A03/MF A01

A parameter model for a least squares estimation of geoidal undulations, sea surface topography etc., which is considered as the basic tool for the use of altimetry as a remote sensing method, is outlined in its general geodetic aspects. Author (ESA)

43 EARTH RESOURCES

Includes remote sensing of earth resources by aircraft and spacecraft; photogrammetry; and aerial photography.

For instrumentation see *35 Instrumentation and Photography*.

EARTH RESOURCES. A CONTINUING BIBLIOGRAPHY WITH INDEXES, ISSUE 24
Jan. 1980 91 p
(NASA-SP-7041(24)) Avail: NTIS HC $10.50 CSCL 05B

This bibliography lists 345 reports, articles, and other documents introduced into the NASA scientific and technical information system between October 1, 1979 and December 31, 1979. Emphasis is placed on the use of remote sensing and geophysical instrumentation in spacecraft and aircraft to survey and inventory natural resources and urban areas. Subject matter is grouped according to agriculture and forestry, environmental changes and cultural resources, geodesy and cartography, geology and mineral resources, hydrology and water management, data processing and distribution systems, instrumentation and sensors, and economic analysis. REMOTE SENSING OF OCEAN SURFACE CURRENT AND CURRENT SHEAR BY HF BACKSCATTER RADAR Ph.D. Thesis
Eng-Chong Ha 1979 153 p
Avail: Univ. Microfilms Order No. 8006317

Radio backscatter experiments to verify the feasibility of radio measurement of ocean current, and its vertical shear were conducted using radar operating at four frequencies covering the range from 3 to 30 MHz. Concurrent in-situ measurements were obtained by tracking spar buoys using a microwave ranging system. Both radar and buoy inferred currents agree generally in their variation with time and depth. Inversion of the Laplace transform relating the radar inferred Doppler velocity as a function of frequency to the vertical profile of the current is achieved numerically. Two estimators of Bragg line width based on the area of the spectral curve and the second moment about its centroid, respectively, are applied to over 100 hours of radar data. It is concluded that multifrequency backscatter ground-wave radar at HF constitutes a powerful technique for mapping current and its vertical profile in the top few meters of the ocean. Dissert. Abstr.

APPLICATION OF LANDSAT IMAGERY TO MONITOR SAND DUNES MOVEMENT IN THE SAHARA DESERT Ph.D. Thesis
Ahmed Mokhtar Brera 1979 347 p
Avail: Univ. Microfilms Order No. 8005371

Band 5 and band 7 imagery available from LANDSAT 1 and LANDSAT 2 for the period between 1972 and 1976 over selected test areas in the Libyan Desert was used to identify and map distinct units on the ground. The results obtained were supported by ground truth data obtained from the selected sites in he form of topographic, geologic, and soil maps, aerial photographs, and meteorological information. The findings indicate that global surveillance of the status of dryland ecosystems and of land use can be achieved most economically through the use of LANDSAT imagery if proper image analysis techniques are used. Sand dune movement of the magnitude one kilometer and more can be detected easily using the proposed system. Dissert. Abstr.

RESOURCE AND ENERGY CONSTRAINTS OF REGIONAL AND GLOBAL AVAILABILITY OF ALUMINUM COPPER, AND IRON 1975 - 2000: A COMPUTER STUDY Ph.D. Thesis
Aldo Francis Barsotti 1979 482 p
Avail: Univ. Microfilms Order No. 8005352

A computer submodel of a world integrated model system indicates that globally the resources and reserves of all three metals are more than adequate to meet projected metal needs, not only for the remainder of this century, but for at least through the year 2025 (assuming some accuracy of projections over that time horizon). The share of total energy needs accounted for by the metal (aluminum, copper and iron) industry varies considerably among countries. Based on economic settings in the model, and projections in growth of downline metal production capacity, the model indicates that forecasted energy production will be inadequate and have a major constraining effect on metal supply in most regions by the year 2000. The regions most affected by that shortage are Oceania, Japan, and Latin America. Because of its total lack of energy resources, Japan will be most vulnerable. Dissert. Abstr.

REMOTE SENSING OF LEAF WATER CONTENT IN THE NEAR INFRARED
Compton J. Tucker, Principal Investigator *In its* Earth Survey Appl. Div.: Res. Leading to the Effective Use of Space Technol. in Appl. Relating to the Earth's Surface and Interior Jan. 1980 p 230-234 ref ERTS (For primary document see N80-20723 11-43)
Avail: NTIS HC A14/MF A01 CSCL 06C

The author has identified the following significant results. Simulated spectral reflectances using different leaf water contents resulted in different reflectance changes in the 0.7 to 2.5 micron region of the spectrum. Consideration of the solar spectral irradiance and atmospheric transmission characteristics shows that the 1.55 to 1.75 micron spectral interval is the best suited band in the 0.7 to 2.5 micron region for monitoring plant canopy water status from space platforms. The 1.48 to 1.75 micron spectral interval is the best suited band for ground-based monitoring of plant canopy water status. The 1.50 to 1.63 micron region shows the greatest spectral radiance changes with a simulated leaf dehydration.

PLANT STRESS AND RELATIONSHIPS TO SPECTRAL RESPONSES
J. B. Schutt, Principal Investigator *In its* Earth Survey Appl. Div.: Res. Leading to the Effective Use of Space Technol. in Appl. Relating to the Earth's Surface and Interior Jan. 1980 p 235-237 ref ERTS (For primary document see N80-20723 11-43)
Avail: NTIS HC A14/MF A01 CSCL 06C

The author has identified the following significant results. Comparison of the near infrared reflectance curves of cotton plants grown in a chamber, greenhouse, and in the field show that field cotton has the lowest relfectance over the regions from 0.8 to 1.3 microns and 1.92 to 2.5 microns, with greenhouse and growth chamber spectra with higher reflectances in respective order. The reflectance levels from 1.42 to 1.92 microns (1.55 to 1.75 microns) were independent of lighting conditions. Spectral response curves recorded in the near-UV and near-IR regions for tomato leaves subjected to O3, SO2, and their combination, show that greater consistency in detectability was found in the new-UV. Results show that visible damage first appeared at the upper surface of a leaf, while incipient damage was first detected at the under surface.

OFF-NADIR VIEWING EFFECTS ON SPECTRAL ASSESSMENT OF GREEN BIOMASS
D. W. Deering, Principal Investigator *In its* Earth Survey Appl. Div.: Res. Leading to the Effective Use of Space Technol. in Appl. Relating to the Earth's Surface and Interior Jan. 1980 p 247-251 ref ERTS (For primary document see N80-20723 11-43)
Avail: NTIS HC A14/MF A01 CSCL 02C

The author has identified the following signficant results. Off-nadir pointing of remote sensors decreased the red radiance and increased the infrared radiance in a situation of sparse ground cover and low levels of green biomass by increasing the proportion of the measured spectral response that was affected by interaction with the plant material component of the vegetation scene. The

magnitude of the spectral radiance value changes with changes in off-nadir viewing angle indicate that from 0 deg to 20 deg no significant radiometric adjustments are necessary, but at larger veiw angles, adjustment-to-nadir algorithms may be necessary for many applications. The infrared/red ratio vegetation index exhibited enhanced sensitivity to the green biomass in low biomass situations.

RADIOMETRIC RESOLUTION FOR MONITORING VEGETATION: HOW MANY BITS ARE NEEDED?
C. J. Tucker, Principal Investigator *In its* Earth Survey Appl. Div.: Res. Leading to the Effective Use of Space Technol. in Appl. Relating to the Earth's Surface and Interior Jan. 1980 p 269-275 ref ERTS (For primary document see N80-20723 11-43)
Avail: NTIS HC A14/MF A01 CSCL 02C
The author has idenfified the following significant results. The solar zenith angle has an effect on the noise equivalent change in reflectance. Two hundred fifty-six quantizing levels gave a 1% to 3% improvement per channel over 64 quantizing levels, and a 1% improvement per channel over 128 quantizing levels. No improvements were found for 256 vs 512 levels. Either 128 or 256 quantizing levels appear optimum for orbital monitoring of terrestrial vegetation for thematic mapper bands 3 and 4, or similar sensor bands. However, the data rate for 256 quantizing levels is 12.5% higher than the data rate for 128 levels, other parameters being equal. The thematic mapper was found to be closely matched to the scene dynamic radiance range for targets without incorporating variable gain control in the instrument.

MICROWAVE REMOTE SENSING TECHNOLOGY FOR THE MARINE OIL POLLUTION SURVEILLANCE
Toshio Nenoto, Ichiro Yokoshima, Yoshihiko Kato, Takehiko Hidaka, Yutaka Kurioka, Minoru Yokota, Shinobu Hashimoto, Hiroshi Nakano, and Masahiko Yamaguchi Aug. 1979 166 p refs In JAPANESE; ENGLISH summary
(Rept-202) Avail: NTIS HC A08/MF A01
The existing state of oil pollution in the adjacent seas of the Japanese Archipelago, the techniques used in the oil detection and monitoring, and technical problems to be met in carrying out the patrol mission concerned with the enforcement of marine environment protection law are outlined. Functional requirements of a practical surveillance system useful for facilitating the activities to prevent the marine oil pollution are given. Basic mechanisms of interactions of microwaves at the air-sea water and air-oil-sea water interfaces are described. Reflection coefficients and emissivities of clean sea and polluted sea are exemplified under a number of different conditions of the temperature and salinity of sea water, observing frequency, and polarization of electromagnetic wave. The mechanisms of interaction between microwave signals and the atmospheric component gases and water droplets of various sizes are described, and examples of parameters useful for calculations of practical atmospheric attenuation and emission of microwaves are given. ASSESSMENT OF SATELLITE AND AIRCRAFT MULTISPECTRAL SCANNER DATA FOR STRIP-MINE MONITORING
Ernie W. Spisz and Joyce T. Dooley Washington Mar. 1980 39 p Original contains color illustrations
(NASA-TM-79268; E-187) Avail: NTIS HC A03/MF A01 CSCL 08I
The application of LANDSAT multispectral scanner data to describe the mining and reclamation changes of a hilltop surface coal mine in the rugged, mountainous area of eastern Kentucky is presented. Original single band satellite imagery, computer enhanced single band imagery, and computer classified imagery are presented for four different data sets in order to demonstrate the land cover changes that can be detected. Data obtained with an 11 band multispectral scanner on board a C-47 aircraft at an altitude of 3000 meters are also presented. Comparing the satellite data with color, infrared aerial photography, and ground survey data shows that significant changes in the disrupted area can be detected from LANDSAT band 5 satellite imagery for mines with more than 100 acres of disturbed area. However, band-ratio (bands 5/6) imagery provides greater contrast than single band imagery and can provide a qualitative level 1 classification of the land cover that may be useful for monitoring either the disturbed mining area or the revegetation progress. However, if a quantitative, accurate classification of the barren or revegetated classes is required, it is necessary to perform a detailed, four band computer classification of the data. J.M.S.

DISTANCE ESTIMATION FROM COGNITIVE MAPS Interim Report, Nov. 1977 - Feb. 1979
Perry W. Thorndyke Nov. 1979 50 p refs
(Contract N00014-78-C-0042; NR Proj. 157-410)
(AD-A080098; RAND/R-2474-ONR) Avail: NTIS HC A03/MF A01 CSCL 08/2
Four experiments investigated map clutter as a source of distortion in distance estimates. In experiments 1 and 2, subjects estimated distances between pairs of points on a memorized map. In experiment 1, subjects learned relative distances among cities incidentally; in experiment 2, they learned them intentionally. In both experiments, estimates increased as a linear function of the number of intervening points along the path. In experiment 3, subjects estimated distances while viewing the map. The clutter effect was reduced but not eliminated. In experiment 4, the clutter effect was demonstrated using subjects' pre-experimental knowledge of U.S. geography. GRA

INTERACTIVE AIDS FOR CARTOGRAPHY AND PHOTO INTERPRETATION Final Technical Report, 12 May 1976 - 9 Oct. 1979
Martin A. Fischler, G. J. Agin, H. G. Barrow, R. C. Bolles, and L. Quam Dec. 1979 129 p refs
(Contract DAAG29-76-C-0057; ARPA Order 2894)
(AD-A079553) Avail: NTIS HC A07/MF A01 CSCL 08/2
Research at SRI International under the ARPA Image Understanding Program was initiated to investigate ways in which diverse sources of knowledge might be brought to bear on the problem of analyzing and interpreting aerial images. The initial phase of research was exploratory and identified various means for exploiting knowledge in processing aerial photographs for such military applications as cartography, intelligence, weapon guidance, and targeting. A key concept is the use of a generalized digital map to guide the process of image analysis. The results of this earlier work were integrated in an interactive computer system called 'Hawkeye'. This system provides not only basic facilities necessary for a wide range of tasks in cartography and photo interpretation, but also a framework within which other applications can be readily demonstrated. ASSESSMENT OF LOW- TO MODERATE-TEMPERATURE GEOTHERMAL RESOURCES OF NEVADA Final Report, Apr. 1978 - Jun. 1979
D. T. Trexler, Thomas Flynn, and Brian A. Koenig 1979 36 p refs
(Contract ET-78-S-08-1556)
(NVO-01556-1) Avail: NTIS HC A03/MF A01

A geothermal resource map of Nevada was produced that provides detailed information on low- to moderate-temperature geothermal systems, and that also evaluates their potential for direct non-electric utilization. The information shown on the map can be divided into two categories: spot data and regional assessment (or potential evaluation). Specific geochemical information, such as temperature, pH, and chemical species, is represented by approximately 300 circle and diamond-shaped symbols. Thirty-seven larger regions were evaluated for their potential for direct-use on the basis of a numerical technique, which is fully described. An additional 15 sites were designated as areas that may provide a basis for investigations, but that lack sufficient data for a detailed potential evaluation at this time. DOE

PLASTIC CANOPY: A COMPUTER PROGRAM FOR THE STRUCTURAL ANALYSIS OF PROTECTIVE CANOPIES
Kenneth D. Winters, Gary R. Gavan, and James C. Aault 1979 205 p refs Prepared in cooperation with Woodward Associates, Inc., San Diego, Calif.
(PB80-122724; BM-IC-8795) Avail: NTIS HC A10/MF A01 CSCL 08I

FORTRAN 4 computer program for the structural analysis of protective canopies used in underground mines to protect equipment operators from roof falls and rollover protective structures used in surface mines to protect equipment during vehicle overturn accidents, is described. The program, entitled PLASTIC CANOPY, permits rapid and inexpensive calculation of the utimate strength and deformation characteristics of a canopy for a variety of static loading conditions. Other features of the program include prediction of buckling of a beam member under combined axial compression loading and bending, plotting of the input geometry of the structure, and plotting of the deformed shape of the loaded structure. Program description, input instructions, program listing, and four example problems are included. GRA

LITHIUM MINERAL COMMODITY PROFILES
Richard H. Singleton Sep. 1979 31 p refs
(PB80-123011) Avail: NTIS HC A03/MF A01 CSCL 08I

The United States consumes over one-half of the world's lithium and provides about 70 percent of the market economy world's supply of lithium. Data are presented on domestic and worldwide lithium production, consumption, and reserves to monitor and analyze supply-demand relationships. Data on lithium including industry structure, uses, resources, technology, byproducts and coproducts, strategic considerations, economic factors and problems, operating factors and problems, and outlook to 2000. ANALYSIS OF CURRENT TRENDS IN U.S. PETROLEUM AND NATURAL GAS PRODUCTION
7 Dec. 1979 11 p

(PB80-116056; EMD-80-24) Avail: NTIS HC A02/MF A01 CSCL 08I

Petroleum and natural gas production in the U.S. is forecasted through the 1990's. It is concluded that production will decline in the 1980's, but could be stabilized in the 1990's provided new enhanced oil recovery techniques are utilized. Developments in frontier areas are also addressed. GRA

ANALYSIS OF WATER RESOURCES REQUIREMENT FOR THE ENHANCED (TERTIARY) OIL RECOVERY IN THE SOUTHERN PLAINS REGION OF THE UNITED STATES

Chia Shun Shih and Susan H. Hamilton Sep. 1979 222 p refs

(Contract DI-14-34-0001-8120)

(PB80-110869; W80-01005; OWRT-B-218-TEX(1)) Avail: NTIS HC A10/MF A01 CSCL 08I

Water resources requirements are analyzed in terms of both water quantity and quality, for the anticipated enhanced oil recovery operations to be implemented in the Southern Plains region of the United States. The enhanced oil recovery potential of each oil-producing reservoir in the four states of Texas, Oklahoma, New Mexico, and Louisiana is assessed using parameters describing the basic characteristics of crude oil and the reservoir formation. The water quality impacts of enhanced recovery method are assessed considering surface water pollution by discharged chemicals and waste waters, groundwater pollution by the fracture of well casings, and infiltration of chemical and oil/water mixtures. PUBLIC INFORMATION AND LAKE EUTROPHICATION: A CASE STUDY OF GULL LAKE IN SOUTHWESTERN MICHIGAN Completion Report, Jul. 1971 - Jun. 1974

George H. Lauff, Brian Moss, and David F. Tague Nov. 1979 74 p refs

(Contracts DI-14-21-0001-3599; DI-14-31-0001-4094)

(PB80-113715; W80-01255; OWRT-B-021-Mich(2)) Avail: NTIS HC A04/MF A01 CSCL 08H

The principal cause of the decline of Gull Lake's water quality is shown to be phosphorus enrichment from septic systems and over-fertilized lawns. Efforts directed toward obtaining a reduction in phosphorus input through a community education and action program are described, including a monitoring program to provide extensive baseline data and dissemination of evidence documenting Gull Lake's degradation; factors which have improved water quality algal increases and changes, and the rate and extent of hypolimnetic oxygen depletion. It is recommended that sewage be diverted from Gull Lake and the use of lawn fertilizers containing phosphorus be eliminated on property adjacent to the lake. GRA

COMPUTER PROCESSING OF MULTISPECTRAL SCANNER DATA OVER COAL STRIP MINES Final Report, 1 Jan. - 30 Jun. 1978

Charles E. Tanner Mar. 1979 62 p refs

(Contract EPA-68-03-2636)

(PB80-111677; EPA-600/7-79-080) Avail: NTIS HC A04/MF A01 CSCL 08I

Aircraft multispectral scanner data acquired over six coal strip mines in the states of Wyoming, Montana, Colorado, and Arizona were processed on the Data Analysis System (DAS) using a clustering approach to automatic pattern recognition. The classification results demonstrated that a level one hierarchy of vegetation features, manmade features, and disturbed areas could be easily obtained with a minimum amount of time. GRA

FUNCTIONAL ANALYSIS OF THE WATER RESOURCES SCIENTIFIC INFORMATION CENTER (WRSIC)

6 Sep. 1979 52 p

(Contract DI-14-34-0001-9601)

(PB80-111842; W80-01201; OWRT-9601(1)) Avail: NTIS HC A04/MF A01 CSCL 08H

In particular, the analysis focused on the relationship of WRSIC to technology transfer and other activities of the Office of Water Research and Technology. Information presented is the result of a modern systems approach that structurally defines the WRSIC mission in terms of detailed functions. Two of the major tools used and their application to the WRSIC mission are described. A graphic overview of the WRSIC information system is included. Recommendations for improving the ability of WRSIC to satisfy present and near future requirements are discussed. GRA

COMPARISON OF THEORETICAL AND EXPERIMENTAL SOLAR CELL PERFORMANCE Ph.D. Thesis
Ching Yuh Robert Fang 1979 235 p
Avail: Univ. Microfilms Order No. 8005560

A detailed comparison of the theoretically predicted performance of silicon solar cells and the experimentally observed performance is presented. The comparison includes the dark one

through five characteristics, the spectra response characteristics, and one through five characteristics under air mass zero illumination. In general it is found that the agreement between theory and experimental behavior is very good. This good agreement is obtained for a variety of cells fabricated with junction depths ranging from 0.1 micrometer to more than 1 micrometer and for base layer resistivities from 10 ohms-cm to 0.1 ohms-cm. Dissert. Abstr.

A COMPARATIVE STUDY OF THE ENERGY ALTERNATIVES FOR THE STATE OF NEW YORK. Ph.D. Thesis
Lewis Chester Cohen. 1979. 303 p.
Avail: Univ. Microfilms. Order No. 7922226

The energy supply and demand picture for the State of New York is examined. The alternatives available to meet future needs are compared. The subject matter is addressed in an interdisciplinary fashion, focusing on the economic, health, environmental, and technological state of the art of the various options. Major economic factors affecting the energy supply problem are illustrated. Various energy alternatives are discussed, which include coal use for gasification versus electrification, large scale generation of electricity, cogeneration, district heating and total energy systems, low lead hydrogeneration of electricity, fuels from biomass, wood, solid waste, solar, and wind. A suggested optimal energy path is developed, along with a scenario of how energy needs should be met. Dissert. Abstr.

PORTABLE HEATABLE CONTAINER. Patent
Lien C. Yang, inventor (to NASA) (JPL). Issued 18 Mar. 1980. 5 p. Filed 19 Apr. 1978. Supersedes N78-24554 (16 - 15, p. 2002). Sponsored by NASA.
(NASA-Case-NPO-14237-1; US-Patent-4,193,388; US-Patent-Appl-SN-897831; US-Patent-Class-126-263; US-Patent-Class-149-15; US-Patent-Class-149-37; US-Patent-Class-220-429) Avail: US Patent and Trademark Office. CSCL 10B

A container is provided which can be designed to heat its outer surface to sterilize it, or to heat its inner surface and any contents therewithin. In a container that self sterilizes its outer surface, the container includes a combustible layer of thermite-type pyrotechnic material which can be ignited to generate considerable heat, and a thin casing around the combustible layer which is of highly thermally conductive materials such as aluminum which can be heated to a high temperature by the ignited combustible layer. A buffer layer which may be of metal, lies within the combustible layer, and a layer of insulation such as Teflon lies within the buffer layer to insulate the contents of the container from the heat.

STUDIES OF P-N JUNCTION SILICON SOLAR CELLS. Ph.D. Thesis
Shing Chong Pao. 1979. 104 p.
Avail: Univ. Microfilms. Order No. 8005484

A silicon solar cell structure which makes use of the positive charges in a passivating silicon dioxide layer to induce a high-low junction in the front emitter surface is designed, fabricated, and analyzed. It is shown experimentally that this structure avoids the degrading effects associated with heavily doped regions and exhibits high values of open circuit voltage. Experimental methods are developed to determine parameters that influence the performance of conventional silicon p-n junction solar cells. One of these methods, which employs the temperature dependence measurement of the minority carrier recombination current in a thin transparent emitter, allows determination of energy bandgap narrowing in heavily doped regions having doping concentrations up to about 10 to the 21 power per cu cm. A second method determines the effective surface recombination velocity describing the high-low junction in a back surface field solar cell. As an additional result, this method provides an estimate of the carrier lifetime in both high and low injection levels. Dissert. Abstr.

N80-20810* National Aeronautics and Space Administration. Langley Research Center, Langley Station, Va.
COMBINED SOLAR COLLECTOR AND ENERGY STORAGE SYSTEM. Patent
Ronald N. Jensen, inventor (to NASA). Issued 11 Mar. 1980. 6 p. Filed 28 Apr. 1978. Supersedes N78-23567 (16 - 14, p. 1868).
(NASA-Case-LAR-12205-1; US-Patent-4,192,290; US-Patent-Appl-SN-900843; US-Patent-Class-126-437; US-Patent-Class-126-434; US-Patent-Class-165-32; US-Patent-Class-126-419) Avail: US Patent and Trademark Office. CSCL 10A

A combined solar energy collector, fluid chiller and energy storage system is disclosed. A movable interior insulated panel in a storage tank is positionable flush against the storage tank wall to insulate the tank for energy storage. The movable interior insulated panel is alternately positionable to form a solar collector or fluid chiller through which the fluid flows by natural circulation. ENERGY CONSERVATION IN THE US: SOME INTERDISCIPLINARY APPROACHES WITH AN EMPHASIS ON INDUSTRIAL COGENERATION. Ph.D. Thesis
Ali Khaki-Kashani. 1979. 273 p.
Avail: Univ. Microfilms. Order No. 8007434

The potential for energy conservation in the United States through industrial cogeneration and energy recovery from municipal solid waste was evaluated. Candidate industries with the highest potential for industrial cogeneration were identified, current and advanced energy conversion systems for cogeneration were analyzed and various cogeneration strategies to maximize the potential fuel savings, were considered. Future market potential, potential energy savings, and the national benefits of industrial cogeneration were studied. Technical analyses for cogeneration systems were performed at several industrial sites and detailed institutional, environmental, and economic analyses were conducted for major categories of institutional settings. The impact of the National Energy Act on the commercialization of industrial cogeneration was discussed. The current status of the various processes available for energy recovery from municipal solid waste was assessed along with the costs associated with each process. Dissert. Abstr.

MARKET DEFINITION STUDY OF PHOTOVOLTAIC POWER FOR REMOTE VILLAGES IN THE UNITED STATES
Clyde Ragsdale and Prosper Quashie. Feb. 1980. 71 p.
(Contract DEN3-49; Contract DE-AI01-79ET-20485)
(NASA-CR-159800; DOE/NASA/0049-80/1) Avail: NTIS HC A04/MF A01 CSCL 10B

A grass roots evaluation of the market potential was carried out for photovoltaic applications in remote villages in the U. S. and its possessions. An estimate of almost 14 MWp available for conversion from a potential to a real market was defined. The total power potential was based on the energy needs of almost 400 sites reported by Federal agencies and inputs from over 100 Indian tribes. The methodology used, the results achieved, and some recommendations of how to convert this domestic market potential into a real market are detailed. R.E.S.

ANALYSIS AND EVALUATION IN THE PRODUCTION PROCESS AND EQUIPMENT AREA OF THE LOW-COST

SOLAR ARRAY PROJECT Quarterly Report, May - Aug. 1979
H. Goldman and M. Wolf Aug. 1979 63 p refs Prepared for JPL and DOE
(Contract JPL-954798)
(NASA-CR-162904; DOE/JPL-954796-79/7) Avail: NTIS HC A04/MF A01 CSCL 10A

The energy consumed in manufacturing silicon solar cell modules was calculated for the current process, as well as for 1982 and 1986 projected processes. In addition, energy payback times for the above three sequences are shown. The module manufacturing energy was partitioned two ways. In one way, the silicon reduction, silicon purification, sheet formation, cell fabrication, and encapsulation energies were found. In addition, the facility, equipment, processing material and direct material lost-in-process energies were appropriated in junction formation processes and full module manufacturing sequences. A brief methodology accounting for the energy of silicon wafers lost-in-processing during cell manufacturing is described. Author

The results of the second phase of the program of developing low cost contacts to silicon solar cells using copper are presented. Phase 1 yielded the development of a plated Pd-Cr-Cu contact system. This process produced cells with shunting problems when they were heated to 400 C for 5 minutes. Means of stopping the identified copper diffusion which caused the shunting were investigated. A contact heat treatment study was conducted with Pd-Ag, Ci-Ag, Pd-Cu, Cu-Cr, and Ci-Ni-Cu. Nickel is shown to be an effective diffusion barrier to copper. J.M.S.

Several microwave systems for use in solar cell fabrication were developed and experimentally tested. The first system used a standing wave rectangular waveguide horn applicator. Satisfactory results were achieved with this system for impedance matching and wafer surface heating uniformity. The second system utilized a resonant TM sub 011 mode cylindrical cavity but could not be employed due to its poor energy coupling efficiency. The third and fourth microwave systems utilized a circular waveguide operating in the TM sub 01 and TM sub 11 but had problems with impedance matching, efficiency, and field uniformity. R.E.S.

(Contracts NAS7-100; JPL-954877)
(NASA-CR-162899; DOE/JPL-954877-79/6; JPL-9950-309) Avail: NTIS HC A06/MF A01 CSCL 10A

The development and evaluation of proprietary coatings of pure silicon carbide, silicon nitride, and aluminum nitride on less pure hot pressed substrates of the respective ceramic materials, is described. Silicon sessile drop experiments were performed on coated test specimens under controlled oxygen partial pressure. Prior to testing, X-ray diffraction and SEM characterization was performed. The reaction interfaces were characterized after testing with optical and scanning electron microscopy and Auger electron spectroscopy. Increasing the oxygen partial pressure was found to increase the molten silicon contact angle, apparently because adsorbed oxygen lowers the solid-vapor interfacial free energy. It was also found that adsorbed oxygen increased the degree of attack of molten silicon upon the chemical vapor deposited coatings. Cost projections show that reasonably priced, coated, molten silicon resistant refractory material shapes are obtainable. J.M.S.

USE OF GLASS REINFORCED CONCRETE (GRC) AS A SUBSTRATE FOR PHOTOVOLTAIC MODULES Final Report
James L. Eirls 12 Mar. 1980 109 p refs
(Contracts NAS7-100; JPL-955281)
(NASA-CR-162898; DOE/JPL-955281-80/4; JPL-9950-300; MB-R-80/05) Avail: NTIS HC A06/MF A01 CSCL 10A

A substrate for flat plate photovoltaic solar panel arrays using a glass fiber reinforced concrete (GRC) material was developed. The installed cost of this GRC panel is 30% less than the cost goal of the Near Term Low-Cost Flat Plate Photovoltaic Solar Array Program. The 4 ft by 8 ft panel is fabricated from readily available inexpensive materials, weighs a nominal 190 lbs., has exceptionally good strength and durability properties (rigid and resists weathering), is amenable to mass production and is easily installed on simple mountings. Solar cells are encapsulated in ethylene/vinyl acetate with Tedlar backing and Korad cover film. The laminates are attached to the GRC substrate with acrylic transfer tape and edge sealed with silicone RTV adhesive. J.M.S.

NASA 50 AMP HOUR NICKEL CADMIUM BATTERY WASTE HEAT DETERMINATION
Vernon C. Mueller *In* NASA. Goddard Space Flight Center The 1979 Goddard Space Flight Center Battery Workshop Apr. 1980 p 269-275 (For primary document see N80-20820 11-44)
Avail: NTIS HC A22/MF A01 CSCL 10C

A process for determining the waste heat generated in a 50-ampere-hour, nickel cadmium battery as a function of the discharge rate is described and results are discussed. The technique involved is essentially calibration of the battery as a heat transfer rate calorimeter. The tests are run at three different levels of battery activity, one at 40-watts of waste heat generated, one at 60, and one at 100. Battery inefficiency ranges from 14 to 18 percent at discharge rates of 284 to 588 watts, respectively and top-of-cell temperatures of 20 C. M.G.

THE APPLICATION OF DC-DC ENERGY CONVERSION IN A SOLAR ENERGY SYSTEM Final Report
John P. Tobak Sep. 1979 156 p

(AD-A077112; AD-E400363; ARMID-TR-78002) Avail: NTIS HC A08/MF A01 CSCL 10/2

Expressions of voltage gain, current, and efficiency are developed for each of five different methods of DC-DC energy conversion. One of the five methods is selected as the design model for a prototype converter to be used in solar energy applications. Both the prototype's performance and the test methods employed are described. Efficiencies as high as 86% are measured along with a constant voltage line regulation of 0.04 volts per volt and a constant voltage load regulation of 0.034 volts per ohm. The prototype acts as a constant 12-volt power supply capable of delivering up to 10-amp currents. GRA

WIND ENERGY IN THE MOUNTAINS OF NEW HAMPSHIRE AS A POTENTIAL ENERGY SOURCE FOR PORTSMOUTH NAVAL SHIPYARD Final Report

William A. Vachon, William T. Downey, Frederic March, Frederick R. Madio, Gerald A. Schimke, and John E. Wade Oct. 1979 188 p

(Contract N00014-79-C-0536; NR Proj. 521-710)

(AD-A076975) Avail: NTIS HC A09/MF A01 CSCL 04/2

A feasibility study was conducted to determine whether the wind energy in the mountainous regions of New Hampshire could be used as a possible energy course for the Portsmouth Naval Shipyard in Portsmouth, New Hampshire. The results indicate that there is adequate wind energy available at mountain sites to drive even the largest wind turbine generators (WT's) now planned, and that many potential sites exist in relatively close proximity to utility lines. Eight specific sites were identified on the basis of available wind speed data, the incidence of s ere icing, environmental constraints, plus on-site interpretation of vegetative deformation by the wind (tree flagging). Based on the experiences of this study there appears to be a limited number of available WT sites which have sufficient geographic extent to support large clusters (i.e., farms) of WT's of approximately 20-100 MW rating. Technically, the local utility can 'wheel' power to the Naval Shipyard from mountain sites, but doing so would not be cost-effective for the Shipyard because of an abundance of on-site, low-cost cogenerated electricity. A simple near-term approach to wind power development in New Hampshire appears to be through the private exploitation of WT clusters of less than 5 MW capacity on private land. GRA

COMPUTER SIMULATION OF A SOLAR ENERGY SYSTEM WHICH UTILIZES FLAT-PLATE COLLECTORS M.S. Thesis

Barry Eugene Prins Dec. 1979 102 p refs

(AD-A079906; AFIT/GAE/AA/79D-15) Avail: NTIS HC A06/MF A01 CSCL 10/2

This thesis is a computer simulation of a solar energy system that utilizes flat-plate solar collectors. By using available data from the U.S. Weather Bureau, the location and orientation of the collector, characteristics of the collector, and the type of storage and backup heat system in use, it is possible to find the amount of solar energy collected and transferred to storage. A life cycle cost analysis can be accomplished by using financial data and an inflation-discount function to reduce all costs to present year dollars. By varying any of a number of parameters the operator can determine what effect it has on the amount of energy collected and the life cycle costs. Results of running the program for a solar water heater system indicate that such a system is cost effective, when compared to a gas water heater system, only when the federal and state tax incentives were taken into account. However, electricity is approximately three times as expensive as gas per BTU of energy gained so the solar energy system is economically feasible when compared to an electric water heating system. GRA

N-TYPE MOLYBDENUM DISELENIDE-BASED LIQUID JUNCTION SOLAR CELLS: A NON-AQUEOUS ELECTROLYTE SYSTEM EMPLOYING THE CHLORINE/CHLORIDE COUPLE

Lynn F. Schneemeyer, Mark S. Wrighton, Angelica Stacy, and Michell J. Sienko 19 Dec. 1979 20 p Submitted for publication Prepared in cooperation with Cornell Univ., Ithaca, N.Y.

(Contract N00014-78-C-0630; NR Proj. 051-696)

(AD-A079712; TR-3) Avail: NTIS HC A02/MF A01 CSCL 10/2

Single crystal, n-type MoSe2 is shown to serve as a stable photoanode in an electrochemical cell employing a nonaqueous (CH3CN) solution of Cl2/Cl(-) as the redox active material. The photoanode reaction is 2Cl(-) Cl2 and the cathode reaction is Cl2 2Cl(-). The MoSe2 is qualitatively better than MoS2 (0.5% efficiency) which has a larger band gap (1.7 eV), but both materials are rugged in the nonaqueous solution while both photocorrode in aqueous Cl(-) solutions. In H2O, the I3(-)/I(-) couple is excellent but in CH3CN it yields lower efficiency than the Cl2/Cl(-) couple. The stable Cl2(-)/Cl(-) system provides evidence that a transparent, reversible, non-O2 sensitive redox couple can be useful in n-type semiconductor-based liquid junction cells employing a direct band gap material having optimum solar response. GRA

EMERGING MATERIALS SYSTEMS FOR SOLAR CELL APPLICATIONS Cu(2-x)Se Quarterly Technical Progress Report, 1 May - 1 Aug. 1979

R. A. Mickelsen, J. M. Stewart, W. S. Chen, and L. F. Buldhaupt Aug. 1979 17 p refs

(Contract DE-AC04-79ET-23005)

(DOE/ET-23005/T1; QTPR-1) Avail: NTIS HC A02/MF A01

The feasibility of using Cu/sub 2-x7Se as a semiconductor material for the low cost production of photovoltaic solar cells was studied. The emphazis was to produce Cu/sub 2-xSe films of good uniformity and reproducibility. The films are deposited onto glass substrates heated to approximately 200 C. The Cu and Se are evaporated from separate sources, each individually monitored for rate by quartz crystal microbalances. The techniques used are readily adaptable for scale up to large volume production. Preliminary measurements of optical absorption, electron diffraction, and Hall measurements were made. DOE

(Contract EY-76-C-04-0789)
(SAND-78-2282) Avail: NTIS HC A03/MF A01

A finite-difference, predictor-corrector, numerical technique is used to solve for fluid and solid temperature distributions in one dimensional flow through a finite length packed bed. The method allows for temperature dependent properties, time varying inlet conditions and nonuniform initial conditions. Computed results agree with the classical Schumann model to within 1% in simulations which exhibit thermal gradients as large as 310 C/m. Additional examples illustrate the attractive characteristics of the method, namely its accuracy, flexibility, ease of implementation, and computational efficiency. DOE

FEASIBILITY OF COGENERATION APPLICATION OF A 4.8 MW FUEL CELL POWER PLANT AT A SANTA CLARA, CALIFORNIA PAPER MILL Final Report
D. E. Criner Jul. 1979 300 p refs
(Contract ET-78-C-03-2189)
(SAN-2189-T1; Rept-78-805-4-005) Avail: NTIS HC A13/MF A01

The feasibility of employing a 4.8-MW fuel cell power plant in a cogeneration mode was evaluated. Ways for utilizing the waste heat from the fuel cell within the paper mill were studied. Several uses were identified which would reduce the amount of process steam now generated by conventional fossil fuel boilers in the paper mill. The electrical energy from the fuel cell could be fed to the municipal electric system or could be used directly by the paper mill, depending upon the form of ownership for the fuel cell. Economic analyses were performed for several scenarios involving different fuels and ownership arrangements. Breakeven capital costs for the fuel cell power plant were computed for the various scenarios. Sensitivity studies were performed to determine the impact of variations in assumed base values for fuel price, electric rates, and other parameters. The environmental implications of the fuel cell power plant were also assessed. DOE

PROJECTIONS OF DIRECT ENERGY CONSUMPTION BY MODE: THE 1975 - 2000 BASELINE
Rita E. Knorr and Marianne Miller Aug. 1979 139 p refs
(Contract W-31-109-eng-38)
(ANL/CNSV-4) Avail: NTIS HC A07/MF A01

A comprehensive set of activity and energy-demand projections are presented for each of the major transportation modes and submodes. Projections were developed for a business-as-usual case which provides a benchmark for assessing the impact of potential conservation strategies. This baseline case assumes a continuation of present trends and no new energy-conserving programs beyond currently mandated fuel economy stands. However, because of anticipated changes in personal vehicle fuel economy, fuel prices, modal shifts, and a lower than historic rate of economic growth, projected growth rates in transportation activity and energy consumption depart from historic patterns. The factors responsible for this departure are discussed. The assumption and methodologies used to develop the modal projections are described and the projections are discussed with other efforts. THERMAL FLUID SELECTION FOR LONG-DISTANCE HEAT TRANSMISSION
S. Szepe and J. M. Calm 1979 8 p refs Presented at the 14th Intersoc. Energy Conversion Conf., Boston, 5 Aug. 1979 Prepared in cooperation with Argonne National Lab., Ill.
(Contract W-31-109-eng-38)
(CONF-790803-47) Avail: NTIS HC A02/MF A01

A model for evaluating fluids for long distance thermal energy transport is presented. The model uses power function approximations for physical and economical relations, and its simplified version provides analytical insights into the optimal allocation of major cost components as well as a solution for the total transmission cost. The model was used to develop a criterion for screening candidate liquids for long distance thermal energy transport. The criterion derived is dependent on the physical properties and unit costs of the candidate fluids, and on the transport requirements. It can be used for fast screening and ranking of a great number of fluids. This approach may save considerable effort by eliminating the need for detailed engineering, economic, environmental, and safety studies on those fluids which would ultimately prove economically undesirable. Representative fluids are discussed and compared with the reference case of transmission by hot water. DOE

HEAT-PUMP-CENTERED INTEGRATED COMMUNITY ENERGY SYSTEMS: SYSTEM DEVELOPMENT Final Report
Fred S. Dubin, Paul Herzog, and Amos Halfon Aug. 1979 450 p refs
(Contract W-31-109-eng-38)
(ANL/CNSV-TM-8) Avail: NTIS HC A19/MF A01

The performance of heat-pump centered integrated community energy systems (HP-ICES) is reported for two case studies, one in Washington, D.C. and the other in Boston, Massachusetts. The ice-generating HP-ICES uses the heat of fusion of water as a heat source for the heat pump, thus converting the water into ice. The ice is sorted in a bin and used the following summer for cooling, which, therefore, could be considered a byproduct of heating. The annual source energy input and the return on investment is cited for each project. The life cycle annual average cost and annual average operating and administration cost for the HP-ICES is given in comparison to corresponding quantities and costs of a conventional central system with equal heating and cooling capacity. PERFORMANCE MODEL FOR MOLTEN CARBONATE FUEL CELLS Final Report, 5 Jul. 1978 - 5 Jul. 1979
G. Wilemski, T. Wolf, D. Bloomfield, M. L. Finson, E. R. Pugh, and K. L. Wray Aug. 1979 171 p refs
(Contract ET-78-C-03-2083)
(TR-190) Avail: NTIS HC A06/MF A01

The development of a performance model for molten carbonate fuel cells is reported. Key physical and chemical phenomena modeled include mass transport, ohmic losses, electrode kinetics, fuel and oxidant utilization, gas phase convective heat transfer and in-plane heat conduction through cell hardware. Numerical schemes were developed and programmed to calculate overpotential versus current density curves for individual electrodes, current-voltage performance curves for entire cells, the cell current density distribution, and the cell temperature distribution. Agreement between model predictions and available experimental data for isothermal electrode and cell performance ranges from good to excellent. Predictions of nonisothermal cell performance are also presented and discussed. DOE

HYDROGEN STORAGE FOR AUTOMOBILES
G. Strickland 1979 4 p refs Presented at the DOE Chem. Energy Storage and Hydrogen Energy Systems Contracts Rev. Meeting, Reston, Va., 12 Nov. 1979
(Contract EY-76-C-02-0016)
(BNL-26906; CONF-791127-5) Avail: NTIS HC A02/MF A01

An analysis of hydrogen-fueled automobiles is presented. The hydrogen is stored either as a metal hydride at moderate pressure in TiFe-Mn-H/sub x/ and at low pressure in MgH/sub x/ catalyzed with 10 wt % Ni, or it is stored in hollow glass microspheres at pressures up to about 400 atm. Each system is briefly described. The results of the vehicle analysis are compared with those for the conventional automobile and with electric vehicles powered by Pb-acid or Ni-Zn batteries. Comparisons are made on the basis of automobile weight, initial user cost, and life-cycle cost. The results are limited to those for the 5-passenger vehicle in the period 1985-1990, and are provided as probable and optimistic values. DOE

RESIDENTIAL SOLAR HEATING AND COOLING USING EVACUATED TUBE SOLAR COLLECTORS: CSN SOLAR HOUSE 3 Final Report, 1 Feb. 1976 - 30 Sep. 1978
D. S. Ward, J. C. Ward, and H. S. Oberoi Mar. 1979 119 p refs
(Contract EY-76-S-02-2858)
(COO-2858-24-Summ) Avail: NTIS HC A06/MF A01

A residential solar heating and cooling system utilizing an array of evacuated tube solar collectors was evaluated. The evacuated tube collectors were removed and replaced with a state of the art liquid-heating flat plate solar collector array. The installation, performance, and operating experience of the evacuated tube solar collector integrated with the CSU Solar House 3 residential sized solar heating and cooling system was examined. DOE

N80-20888# General Atomic Co., San Diego, Calif.
INSTALLATION AND STARTUP OF THE FIXED MIRROR SOLAR CONCENTRATOR COLLECTOR FIELD SUBSYSTEM Final Report, 31 Jan. 1977 - 31 Mar. 1979
G. H. Eggers Jun. 1979 111 p refs
(Contract EY-76-C-04-0789)
(GA-A-15344; SAND-79-7015) Avail: NTIS HC A06/MF A01

The design, fabrication, installation, and startup of the fixed mirror solar concentrator is described. The total system cost was $773 per m squared. The system cost projection for a commercial plant is $188.73 per m squared. At design conditions, with the oil inlet temperature at 245 C and the oil outlet temperature at 316 C, the peak system efficiency at noon was 36.8%. DOE

EVALUATION OF A SULFUR OXIDE CHEMICAL HEAT STORAGE PROCESS FOR A STEAM SOLAR ELECTRIC PLANT
Joshua Dayan, Scott Lynn, and Alan Foss Jul. 1979 198 p refs Revised
(Contract W-7405-eng-48)
(LBL-7868-Rev) Avail: NTIS HC A09/MF A01

A technically feasible process configuration was developed for the sulfur oxide system, 2 SO3 reversible 2 SO2 + O2 in energy storage. Complete material and energy balances are presented for a base case that represents a middle range of expected operating conditions. Equipment sizes and costs were estimated for the base case to obtain an approximate value for the cost of the electricity that would be produced from such an installation. In addition, the sensitivity of the efficiency of the system to variations in design and operating conditions was determined for the most important parameters and design details. The overall efficiency of converting heat into electricity is about 26%. DOE

OPTICAL ANALYSIS AND OPTIMIZATION OF LINE FOCUS COLLECTORS
P. Bendt, A. Rabl, H. W. Gaul, and K. A. Reed Sep. 1979 73 p refs
(Contract EG-77-C-01-4042)
(SERI/TR-34-092) Avail: NTIS HC A04/MF A01

A macroscopic approach to the optical analysis of a solar concentrator is described. The method yields all the parameters needed for the optical design of line focus parabolic troughs. The flux at the receiver is determined as a function of concentrator along with receiver size, width of Sun, and optical errors. All causes of image spreading are quantified as angular standard deviation. Ray tracing with a real reflector and a real Sun is shown to be equivalent to convoluting the angular acceptance function of a perfect concentrator with an effective radiation source. This effective source, in turn, is obtained by convoluting the distribution function of optical errors with the angular profile of the Sun. The problem is reduced to two dimensions by projecting the three dimensional motion of the Sun on the plane normal to the tracking axis. In this frame the apparent width of the Sun increases with incidence angle. A formula and a simple graphical procedure are provided for finding the optimal geometric concentration ratio, maximizing net power output. The results are illustrated by specific examples. DOE

INTERFEROMETRIC STUDY OF THE NATURAL CONVECTION CHARACTERISTICS OF FLAT PLATE, SLAT AND VEE-CORRUGATED SOLAR COLLECTORS Final Report
M. M. ElWakil and J. W. Mitchell 30 Jun. 1979 7 p
(Contract EY-76-S-02-2971)
(COO-2971-6) Avail: NTIS HC A02/MF A01

The natural convection heat transfer relations for the heat transfer between absorber and cover plates of solar collectors were studied. Interferometric techniques were employed to evaluate the local coefficients. Average values were obtained by integration of the local values. The results are presented in terms of correlations between Nusselt number and Grashof number. The investigations were carried out over tilt angles of 45 to 90 degrees. The Grashof number range tested was representative of that existing in flat plate collectors. The various geometrics included large flat enclosures, small aspect ratio enclosures representative of honeycomb or slat collectors, vee-corrugated

(vee-grooved) collectors, and compound parabolic concentrators. DOE

METHODOLOGY FOR EVALUATING PHYSICAL CONSTRAINTS ON RESIDENTIAL SOLAR ENERGY USE
P. L. Smith and S. T. McCreary 1979 73 p refs
(Contract W-7405-eng-48)
(UCRL-15001) Avail: NTIS HC A04/MF A01

A procedure is set forth for assessing physical constraints on solar energy use at the site scale and for computerized findings as a data base for analysis at the community, sub-community, and individual parcel scales. Background information regarding the development of the project is presented. Next, the solar technologies being considered, their requirements for optimal performance, and physical constraints on the achievement of those requirements are described. This theoretical discussion is followed by a description of its application to a case study community. A discussion of the types of analyses in which the computerized data can be used is followed by a discussion of the way in which these analyses can be used at various points in governmental and private planning and decision-making processes. ECONOMICS OF THERMAL ENERGY STORAGE FOR COMPRESSED AIR ENERGY STORAGE SYSTEMS
S. C. Schulte Aug. 1979 8 p refs
(Contract EY-76-C-06-1830)
(PNL-SA-7949) Avail: NTIS HC A02/MF A01

The costs of compressed air energy storage (CAES) systems utilizing thermal energy storage are compared with the costs of conventional CAES systems and combustion gas turbine systems. Comparisons are made on the basis of system energy cost levelized over system operating lifetime (mills/kWh). Two principal conclusions resulted from the study. First, given today's fuel prices and the expected fuel prices in the 1980's, conventional CAES systems yield lower energy cost estimates than combustion gas turbine systems. Second, thermal energy system storage/adiabatic CAES systems yield equivalent and, in some instances, slightly lower energy cost estimates than conventional CAES systems while requiring considerably less turbine fuel oil. DOE

N80-20904# Battelle Pacific Northwest Labs., Richland, Wash.
ECONOMICS OF COMPRESSED AIR ENERGY STORAGE EMPLOYING THERMAL ENERGY STORAGE
S. C. Schulte and R. W. Reilly Nov. 1979 34 p refs
(Contract EY-76-C-06-1830)
(PNL-3191) Avail: NTIS HC A03/MF A01

System design and capital cost estimates are adopted from three independent studies to arrive at a series of levelized energy costs over a system's lifetime. In addition, some analyses are provided to gauge the sensitivity of these levelized energy costs to fuel and compression energy costs and to system capacity factors. The systems chosen for comparison are conventional CAES, hybrid CAES, adiabatic CAES, and an advanced-design gas turbine. In conventional CAES systems the heat of compression generated during the storage operation is rejected to the environment, and later, during the energy generation phase, turbine fuel must be burned to reheat the compressed air. In the hybrid systems some of the heat of compression is stored and reapplied later during the generation phase, thereby reducing turbine fuel requirements. The adiabatic systems store adequate thermal energy to eliminate the need for turbine fuel entirely. The gas turbine is included within the report for comparison purposes. DOE

N80-20905# Department of Energy, Washington, D. C.
BIOMASS ENERGY SYSTEMS: ENVIRONMENTAL READINESS DOCUMENT
Sep. 1979 50 p
(DOE/ERD-0021) Avail: NTIS HC A03/MF A01

A number of environmental and socio-economic impacts of biomass energy systems are identified. The large land and water requirements for terrestrial biomass energy production might lead to socio-economic conflicts. It might also lead to an increase in potential for air and water erosion of the soil. Severe ecosystems impacts would result from disturbing 100 million acres of marginal farm land and 350 million acres of forest land. Removal of residues could increase nutrient removal and reduce the amount of organic matter returning to the soil and limit future biomass production. Air pollution from the direct combustion of biomass must be considered. The systems of ethanol with stillage is dependent on the feedstock. The energy costs to purify the ethanol and pollution control costs appear to prevent economical production of ethanol in the near term. DOE

DETERMINING THE FEASIBILITY OF INCORPORATING WATER RESOURCE CONSTRAINTS INTO ENERGY MODELS Final Report
N. Buras Aug. 1979 132 p refs Sponsored by Elec. Power Res. Inst.
(EPRI-EA-1147) Avail: NTIS HC A07/MF A01

The availability of regional water resources for energy related activities is discussed in terms of the feasibility of integrating these availabilities into energy models. Following reviews of water resources data bases, of technologies involved in energy development, and of energy models with regional disaggregation, two models are used for the study of this integration: the Regional Energy System Optimization Model (RESOM), and the Energy Policy Model (EPM). Water resources constraints are introduced in these models, and exploratory computer runs using demonstration scenarios are made. The test scenarios assumed that nonenergy users would make increasing demands upon regional water resources, leaving limited amounts of increasingly more expensive water for energy activities. The results of the exploratory runs demonstrate the feasibility of

integrating water resources availabilities and water consumption data into energy-economy models. DOE

SNOW AND ICE ACCUMULATION AT SOLAR COLLECTOR INSTALLATIONS IN THE CHICAGO METROPOLITAN AREA Final Report
Ross B. Corotis, Charles H. Dowding, and Edwin C. Rossow Aug. 1979 109 p Sponsored in part by DOE, Washington, D.C.
(PB80-113749; NBS-GCR-79-181) Avail: NTIS HC A06/MF A01 CSCL 10A

Observations and data concerning snow and ice on eighteen flat plate solar collector installations in the Chicago area are presented. The data were collected in February and March of 1979, following a record snowfall in January. Nearly all of the installations were on the roofs of buildings, and about half were mounted flush with the roof. The remainder were mounted on racks at an angle to the roof. Sketches and photographs of the buildings and snow accumulation, weather data for the entire winter, and comments of the owners are included, as well as a technique for the extraction of linear measurements from the photographs. SOLAR PONDS FOR RESIDENTIAL HEATING, HEAT EXTRACTION FROM A SALT GRADIENT SOLAR POND Final Report, 19 Aug. 1976 - 30 Jun. 1977
F. Zangrando and H. C. Bryant Jul. 1979 41 p refs Sponsored in part by New Mexico Energy and Minerals Dept., Santa Fe
(PB80-108624; NMEI-45) Avail: NTIS HC A03/MF A01 CSCL 10A

A salt gradient solar pond is an efficient, low cost solar energy collection and long range storage system for low temperature heat. Research efforts to establish operational parameters, selection criteria for the materials to be used, cost and performance are described. The physical behavior of doubly diffusive systems exposed to the environment was also studied. GRA

DEVELOPMENT AND EVALUATION OF A MODEL DOUBLY-FED MACHINE
F. R. Schleif Sep. 1979 75 p refs
(PB80-100662) Avail: NTIS HC A04/MF A01 CSCL 09C

The design and development of a model doubly-fed machine system was studied and evaluated for potential application on two generators and the pump/generating units of pump-storage projects. It was found that this problem of instability can be overcome. The machine has a wide variety of capabilities which are indicated to presently practical for exploitation to satisfy special needs such as adjustable speed, rapid synchronizing ability, system damping, or superior frequency control of an isolated system. ATMOSPHERIC TRANSPORT OF ACIDITY IN SOUTHERN CALIFORNIA BY WET AND DRY MECHANISMS Ph.D. Thesis
Howard Michael Liljestrand 1980 179 p
Avail: Univ. Microfilms Order No. 8006281

Acid precipitation samples were analyzed to determine acid and base composition. The concentrations of major cations and anions as well as trace weak acids were determined. The chemical

composition of the precipitation samples collected were modeled in several ways: (1) chemical balances to determine the contributions of sea salt, soil dust, stationary sources, mobile sources, and nonpoint sources of ammonia; (2) multiple regression analysis to relate ground level measurements of air quality and atmospheric conditions with rainwater nitrite plus nitrate and sulfate concentrations; and (3) gas-liquid equilibrium models.

TRACE CHARACTERIZATION OF METALS IN SOLID SAMPLES AND AIR POLLUTANTS Ph.D. Thesis
Horng-Yih Wei 1978 159 p
Avail: Univ. Microfilms Order No. 8006562

A method for direct characterization of trace metals in solid samples is described. Solid samplers were first ground to powders and mixed with graphite powder followed by direct non-flame spectrophotometry. Several experimental parameters were studied for the determination of lead, cadmium and silver in rock samples via atomizers. Two novel methods are also described for the determination of lead pollutants in air. Subliter samples of air drawn through 6.4 mm diameter porous graphite disk were analyzed by either (1) direct non-flame atomization or (2) by a technique involving electrodeposition onto a tungsten coil which is subsequently used as an atomizer. Analytical results achieved on atmospheric samples by both of these methods are shown to agree well with results achieved using conventional methods.

POLLUTANT FORMATION IN FLAT LAMINAR OPPOSED JET DIFFUSION FLAMES Ph.D. Thesis
Werner Artur Hahn 1979 206 p
Avail: Univ. Microfilms Order No. 8006739

It is shown that the opposed jet diffusion flame has one useful attribute that distinguishes it from all other diffusion flames. This feature is the one-dimensionality of the flame with respect to temperature, concentration, and axial (but, clearly, not radial) velocity profiles. This is shown by first applying a similarity transform on the radial velocity, converting the partial differential equations to ordinary differential equations and then numerically solving the momentum, energy, and species balance equations in a fully coupled manner. The numerical, variable mesh algorithm required for the solution of the resulting large set of very stiff, boundary valued, ordinary differential equations is presented. The model then allows determination of the correct velocity boundary conditions such that the flame is (mathematically) flat and one-dimensional.

This model of the D. Forrester type, constructed in differential equations, predicts the food and mineral supply for the factors biosphere population, depending on two socio-economic factors, until about the year 2500. If contemporary rates of natural resources utilization are maintained and there is no management of the environment, food resources will begin to limit human population growth after 2200, and mineral resources will after 2300. A decrease in the biosphere pollution, increase in effective agricultural production, and discovery of new energy sources may forestall or completely avert the onset of a crisis situation. Conservation measures, according to the model, are to a considerable extent realizable only if carried out simultaneously in both areas.

ENVIRONMENTAL DEVELOPMENT PLAN: COAL EXTRACTION AND PREPARATION
Sep. 1979 98 p refs
(DOE/EDP-0050) Avail: NTIS HC A05/MF A01

The environmental strategy to be used by DOE to resolve environmental concerns associated with coal extraction and preparation will be to: (1) schedule environmental research in coordination with the development of the technology through its research, development and demonstration phases; (2) identify what environmental research is already underway; (3) provide for an Environmental Coordination Committee to ensure that the appropriate research is conducted in a timely manner; (4) schedule compliance activities, such as National Environmental Policy Act (NEPA) documents and Environmental Readiness Documents (ERD's) at appropriate times in the RD and D cycle; and (5) develop a monitoring approach to track the compliance of each technology with applicable Federal, State and local standards and with the performance goals established for that technology. The initial evaluation of the coal extraction and preparation program indicates that the demonstrations of technologies in the program will be undertaken within existing industrial mining/preparation facilities and therefore will not present significant identifiable impacts. Project-specific Environmental Assessment or Impact Statements will be made on a project specific basis. Even so, assessments must be made prior to the employment of program elements.

ENVIRONMENTAL ASSESSMENT METHODOLOGY: SOLAR POWER PLANT APPLICATIONS. VOLUME 1. ENVIRONMENTAL IMPACT ASSESSMENT METHODOLOGY Final Report
K. Nair and A. Sicherman May 1979 161 p refs
(EPRI Proj. 551)
(EPRI-ER-1070-Vol-1) Avail: NTIS HC A08/MF A01

A methodology for environmental impact assessment of solar power stations based on decision analysis is presented. A general overview of the methodology is given including a discussion of the issues warranting a formal analysis, the advantages of decision analysis from the decision maker's perspective, and some case study examples where the methodology was applied. The step-by-step implementation procedure for performing an environmental impact assessment using the methodology is described. The manner in which the methodology can incorporate cost into the analysis, both as a concern and as a yardstick of comparison, is discussed. Decision analysis and cost-benefit analysis are compared and contrasted. The appendix includes a bibliography concerning methods used by industry and/or government to make monetary estimates of environmental impacts. DOE

THEORETICAL ANALYSIS OF PERTURBATION SOLUTIONS TO THE PROBLEM OF INERTIAL CAPTURE OF AEROSOL PARTICLES Interim Report
S. C. Yoon Jul. 1979 34 p refs
(Contract EY-76-S-06-2227)
(RLO-2227-727-7) Avail: NTIS HC A03/MF A01

Perturbation solutions are sought to the problem of inertial capture of aerosol particles. An exact solution is obtained for the particle velocity along the axis of symmetry. The exact solution suggests that the perturbation solution is extremely accurate for all Stokes numbers except those very near the critical Stokes number. Also, under certain boundary conditions, the exact solution shows that inertial capture can occur even for particle with Stokes numbers less than the critical Stokes number. A computer extension technique is examined for the analysis and improvement of the perturbation series. DOE

COMPREHENSIVE STUDY OF DRIFT FROM MECHANICAL DRAFT COOLING TOWERS Final Report
N. S. Laulainen, R. O. Webb (Environmental Systems Corp., Knoxville, Tenn.), K. R. Wilber (Environmental Systems Corp., Knoxville, Tenn.), and S. L. Ulanski (James Madison Univ., Harrisonburg, Va.) Sep. 1979 233 p refs
(Contract EY-76-C-06-1830)
(PNL-3083) Avail: NTIS HC A11/MF A01

Drift from mechanical draft cooling towers was studied by the simultaneous measurement of cooling tower source emission parameters meteorological variables, and drift deposition patterns during seven of eight test runs. Results from six of these test runs are presented and discussed. Substantial variation in drift emissions were noticed. Large day-to-day variations for a given cell and large cell-to-cell variations were observed. Meteorological conditions during the drift study were characterized by relatively high winds, warm temperatures and moderate humidities. The relatively high winds increased the uncertainty in the measured deposition patterns. In spite of the large (factor of 2 or 3) uncertainty in the measured deposition rates, preliminary calculations of drift deposition rates are in agreement with each other for test run 1. DOE

COAL-CONVERSION TECHNOLOGIES: SOME HEALTH AND ENVIRONMENTAL EFFECTS
S. C. Morris, P. D. Moskowitz, W. A. Sevian, S. Silberstein, and L. D. Hamilton Feb. 1979 27 p refs
(Contract EY-76-C-02-0016)
(BNL-5103; TID-4500) Avail: NTIS HC A03/MF A01

Selected health and environmental concerns of four coal conversion and four existing technologies are compared. Quantitative occupational health and safety estimates are presented covering extraction, transportation, distribution, processing, and conversion activities; also included are estimates of public health damage arising from fuel transportation and air pollution impacts. Qualitative estimates of health damage due to polycyclic organic matter and reduced sulfur are discussed. In general, energy inefficiencies, residuals, and implied environmental and health damages increase as follows: (1) direct combustion of natural gas and oil; (2) direct combustion of synthetic gas and oil; (3) central station electric power from synthetic gas; (4) central station electric power from coal; and (5) central station electric power from combustion of synthetic liquid fuels. Compliance and conflict of these technologies with Clean Air Act Amendments and other legislation are discussed. DOE

LIGHT-DUTY DIESEL GASEOUS EMISSIONS MEASUREMENT - COMPARISON OF DILUTION TUNNEL TEST RESULTS TO CERTIFICATION CELL TEST RESULTS
Jeff Alson. Jan. 1979 13 p.
(PB80-115991; SDSB-79/04) Avail: NTIS HC A02/MF A01 CSCL 13B

Gaseous emissions data are summarized for eleven light-duty diesel vehicles using both the standard certification test procedure and the dilution tunnel test procedure which incorporates particulate measurement. The greatest variability was found in the HC variability inherent in measuring HC and, in the extreme cases, also to equipment inconsistencies between the test cells. CO, NOx and CO2 data from the dilution tunnel test procedure were generally in good agreement with the certification data with the only trend being slightly lower NOx and CO2 values from the dilution tunnel. This is hypothesized as a possible dynamometer effect. It is concluded that there are no significant differences in the two test procedures with regards to the measurement of gaseous emissions. GRA

USER'S GUIDE FOR NUMERICAL MODELING OF BUOYANT PLUMES IN A TURBULENT, STRATIFIED ATMOSPHERE
Ralph G. Bennett and Michael W. Golay. Feb. 1979 228 p. refs. Sponsored by Consolidated Edison Co., N. Y. and Northeast Utilities Service Co., Hartford, Conn.
(PB80-114549; MIT-EL-79-004) Avail: NTIS
HC A11/MF A01 CSCL 13B

A widely applicable computational model of buoyant, bent-over plumes in realistic atmospheres is developed. A three-dimensional picture of a steady state plume is constructed from a sequence of time-dependent, two-dimensional plume cross sections-each cross section of the sequence is spaced progressively further downwind as it is advected for a progressively longer time by the prevailing wind. The buoyancy sources in the plume include the sensible heat in the plume, the latent heat absorbed or released in plume moisture processes, and the heating of the plume by a radioactive pollutant in the plume. Atmospheric variables are allowed to be functions of height, and the ambient atmospheric turbulence is included in the simulations. GRA

THE IMPACT OF FUTURE DIESEL EMISSIONS ON THE AIR QUALITY OF LARGE CITIES Final Report
Roy A. Paul. May 1979 228 p. refs.
(Contract EPA-68-02-2585)
(PB80-113657; EPA-450/3-79-005) Avail: NTIS
HC A11/MF A01 CSCL 13B

The impact of diesel-powered vehicles in the central business districts of New York, Chicago and Los Angeles was studied. Annual particulate matter emissions from automobiles, taxis, buses and light-duty trucks were projected to the year 2000. The emissions were correlated with air monitoring data in order to calculate the impact on air quality. Significant increases were predicted in atmospheric particulate matter because of increased diesel engines. GRA

ASSESSMENT OF THE IMPACT OF RESOURCE RECOVERY ON THE ENVIRONMENT Final Report
Judith G. Gordon. Aug. 1979 147 p. refs.
(Contract EPA-68-03-2596)
(PB80-102874; EPA-600/8-79-011) Avail: NTIS
HC A07/MF A01 CSCL 13B

The environmental effects of municipal solid waste disposal in 1990 and the changes in these effects resulting from implementation of resource recovery from municipal solid waste are assessed. The direct effects of municipal solid waste disposal as well as the secondary effects of substituting materials recovered from municipal solid waste for raw materials in the production of steel, aluminum, glass, and energy are considered. Energy conservation resulting from use of recovered scrap in materials production and energy production by recovery of energy from municipal solid waste is also evaluated. The analysis is based on specific scenarios for municipal solid waste disposal in 1990 without and with implementation of resource recovery. GRA

CONTROL TECHNOLOGIES FOR PARTICULATE AND TAR EMISSIONS FROM COAL CONVERTERS
C. Chen, C. Koralek, and L. Breitstein. Jul. 1979 115 p. refs.
(Contract EPA-68-02-2601)
(PB80-108392; EPA-600/7-79-170) Avail: NTIS
HC A06/MF A01 CSCL 13B

Solid and tar particulate emissions in raw product gases from several types of coal gasifiers are characterized in terms of their total quantities, chemical composition, and size distribution. Control technologies for particulate emissions were assessed with respect to the limitations of the control device and to existing and proposed regulations. Fabric filters were not suitable

where tar particulates were found or at higher than 300 C. Electrostatic precipitators operated as high as 1100 C. Rotary cyclones showed the widest range of applicability, but conventional cyclones were most economical for particles larger than 50 microns. Solid and tar particulate emissions collected for 250,000 scfd of a medium-Btu gas contained up to 1.6 million kg of particulate. GRA

HOT GAS CLEANUP PROCESS Final Report, Jan. 1977 - Mar. 1979
A. Bekir Onursal Jul. 1979 155 p refs
(Contract EPA-68-02-2601)
(PB80-108467; EPA-600/7-79-169) Avail: NTIS
HC A08/MF A01 CSCL 13B

The results of a study to identify and classify 22 hot gas cleanup (HGC) processes for desulfurizing reducing gases at above 430 C according to absorbent type into groups employing solid, molten salt, and molten metal absorbents are presented. Each process is described in terms of its status, chemistry, operating characteristics, problems, and uncertainties. The applicability of non HGC processes to a variety of coal gasification systems for several end uses for the product gases is assessed. Advantages and disadvantages of HGC relative to conventional low temperature cleanup systems with respect to thermal efficiency, the presence and/or emissions of tars, particulates, and NOx, and corrosion are described. A STUDY OF MAGNETOGRAVITY WAVES Ph.D. Thesis
Meyer Bouscher 1980 92 p
Avail: Univ. Microfilms Order No. 8006397

The geometry of magnetogravity wave surfaces in an incompressible, isothermal, inviscid, nonrotating, flat, horizontally stratified perfectly conducting atmosphere was studied in order to verify that such waves may contribute heavily to the heating of the upper solar atmosphere. The equations of the wave surface were determined from those of the wave normal surface using the envelope construction. The locations of the cuspidal edges were determined for vertical, horizontal, and oblique magnetic fields. In addition, a line of self-intersection was found along the directions of the horizontal and oblique fields. The existence of the line of self-intersection suggests that magnetogravity waves, at least those of high enough frequency, can carry energy upward along the solar magnetic field, thus lending support to Lighthill's conjecture. Dissert. Abstr.

PRECIPITATION AND ACCUMULATION ESTIMATES FOR EAST ANTARCTICA, DERIVED FROM RAWINSONDE INFORMATION Ph.D. Thesis
David Howard Bromwich 1979 156 p
Avail: Univ. Microfilms Order No. 8004706

A rigorous analysis of the rawinsonde data from 9 coastal stations and one on the plateau is given. A special attempt is made to resolve the key boundary layer properties. A systematic and important bias in the record due to missed observations during storms is demonstrated. Estimates for these missing values which are obtained from multilinear regression equations increase the computed annual poleward water vapor transport at two stations by more than 30 percent. Other significant observations are reported. Dissert. Abstr.

N80-20957 Stanford Univ., Calif.
CRYSTALLIZATION AND METASOMATISM OF THE CUCHILLO MOUNTAIN LACCOLITH, SIERRA COUNTY, NEW MEXICO Ph.D. Thesis
David Kent McMillan 1979 298 p
Avail: Univ. Microfilms Order No. 8006330

The Cuchillo Mountain laccolith, of early Tertiary age, is a hypabyssal, quasiconcordant mass of porphyritic monzonite enclosed by carbonate strata of Pennsylvanian age. It is comagmatic with a thick sequence of propylitized volcanic rocks that are extensively exposed in adjacent areas. Rocks of the laccolith were pervasively propylitically altered, with a principal change from andesine monzonite porphyry to albite porphyry.

Pre-emplacement crystallization is represented by a phemocryst assemblage that comprises minerals observed in chilled margins other than as groundmass. Post-emplacement crystallization is represented by groundmass consisting of microlitic alkali feldspar hosted by quartz, and an assemblage of micarolitic products that are not present in the chilled margins. Large-scale redistribution of constituents, chiefly the major alkalies, is reflected by increasing intensities of albitization, epidotization, chloritization, and iron oxidation from the margins toward the interior of the intrusion, and by apparently complementary potassium enrichment near the margins. Dissert. Abstr.

N80-20958 Oregon State Univ., Corvallis.
STRONTIUM ISOTOPIC AND TRACE ELEMENT GEOCHEMISTRY OF THE SADDLE MOUNTAINS AND GRANDE RONDE BASALTS OF THE COLUMBIA RIVER BASALT GROUP Ph.D. Thesis
Dennis Oliver Nelson 1980 234 p
Avail: Univ. Microfilms Order No. 8007125

Variations in trace element and Sr isotopic compositions in the Columbia River Basalt (CRB) are discussed. These compositions reflect complex and variable origins for the CRB magmas. Among the most varied is the Saddle Mountains Basalt (SMB) in which Sr ratios vary from 0.7078 to 0.7147 + or - 0.002. The higher ratios reflect contamination through consistent correlations with major element compositions. Age and field relations suggest that the contaminated flowrocks are not the result of progressive contamination of a single magma, but rather reflect the contamination of independent magmas during this ascent. The Pomona and Elephant Mountain Basalts (SMB) reflect mantle values. These basalts erupted from the Chief Joseph dike swarm along with the Grande Ronde (GRB) and Wanapum Basalts. Together, the GRB and SMB indicate a mantle source with Sr ratios varying from 0.7043 to 0.7081. Dissert. Abstr.

N80-20959 California Univ., San Diego.
MARINE GEOLOGY AND TECTONIC EVOLUTION OF THE NORTHWESTERN MARGIN OF THE CALIFORNIA CONTINENTAL BORDERLAND Ph.D. Thesis
James Keene Crouch 1979 116 p
Avail: Univ. Microfilms Order No. 8006883

The geology and history of the northwestern margin of the California continental borderland are examined using data from seismic-reflection profiling and bottom sampling. It is suggested that the northwestern margin of the borderland along with the western Transverse Ranges was rifted from an original tectonic setting off northern Baja California begining about 18 m.y. ago. During the rifting event, the Franciscan and Great Valley belts underlying the outer borderland were translated northwestward along a ridge-trench transform fault resulting in: (1) a repetition of these belts in the borderland off Southern California, and (2) clockwise rotation and subsequent thrusting of these belts (western Transverse Ranges) against the southern Coast Ranges. Dissert. Abstr.

N80-20960 Purdue Univ., Lafayette, Ind.
FINITE-DIFFERENCE SYNTHETIC SEISMOGRAMS FOR KINEMATIC MODELS OF THE EARTHQUAKE SOURCE Ph.D. Thesis
Juan Manuel Espindola 1979 162 p
Avail: Univ. Microfilms Order No. 8005867

The dynamic displacement field of kinematic dislocation in two dimensions is modeled by a finite-difference technique in skew coordinates. The scheme involves the solution of the heterogeneous, elastic vector wave equation subjected to dislocation conditions. Algorithms are included to model the free surface and absorbing artificial boundaries which simulate an infinite half-space. Specification of faults with arbitrary dip is implemented by means of the skew-coordinate system. Other source parameters such as time-history, slip-function, and rupture velocity are user selected. Near-field synthetic seismograms were calculated by this procedure for selected source parameters for two cases of geologic interest (i.e., buried basin and layer over a half space). These examples illustrate the influence of fault parameters and local geology on ground motion. Significant effects due to the heterogeneous media and various fault and source parameters suggest that the method can provide a new realistic modelling tool for the study of the interaction between the earthquake source and the local geology in the near-field for long period ground motion. Dissert. Abstr.

N80-20961 Stanford Univ., Calif.
A NON-GAUSSIAN STOCHASTIC MODEL APPLIED TO DECONVOLUTION AND SEISMOGRAM INVERSION Ph.D. Thesis
Robert John Godfrey 1979 97 p
Avail: Univ. Microfilms Order No. 8006313

An algorithm that iteratively removes the source waveform present in a suite of seismograms was developed and tested on real data. Assuming a non-Gaussian reflectivity model, both the color and phase effects of the source waveform were removable from the seismogram. The main ingredient in the algorithm is a zero memory (instantaneous) non-linear estimator of reflection coefficient amplitude. Forcing a filtered version of the seismogram to resemble these estimates was accomplished iteratively. An algorithm that converts a deconvolution into acoustic impedance is proposed. A feature of the algorithm is the ability to merge additional information, besides the deconvolution, into the computation of impedance. Dissert. Abstr.

N80-20962 Purdue Univ., Lafayette, Ind.
THE GENERATION OF SYNTHETIC SEISMOGRAMS FOR LATERALLY HETEROGENEOUS MODELS USING THE FINITE DIFFERENCE TECHNIQUE Ph.D. Thesis
Frederick Elwood Mazzella 1979 239 p
Avail: Univ. Microfilms Order No. 8005914

A method for the generation of synthetic seismograms for two-dimensional heterogeneous models specified only by P wave (dilatation) velocity is developed. Synthetic seismograms are calculated for seven heterogeneous (both vertical and horizontal) geologically realistic models. Each model is described graphically and is accompanied by a displacement seismogram record section for the vertical and horizontal components. These record sections reveal significant amplitude and time effects which result from the velocity structure. Dissert. Abstr.

N80-20963 Stanford Univ., Calif.
PRE-STACK PARTIAL MIGRATION Ph.D. Thesis
Ozdogan Yilmaz 1979 126 p
Avail: Univ. Microfilms Order No. 8006373

A procedure to improve conventional seismic data processing by removing the degrading effect of wide offsets on dipping events so that they stack coherently is proposed. The pre-stack partial migration provides the interpreter with a high quality common midpoint (CMP) stack section which can be subsequently migrated. The theory of pre-stack partial migration is based on the double square root equation, which describes seismic imaging with many shots and receivers. The double square root operator in common midpoint space can be approximately separated into two terms, one involving only migration effects and the other involving only moveout correction. This separation provides an analysis of conventional processing. Estimation of errors in the separation yields the equation for pre-stack partial migration. Dissert. Abstr.

HOTSPOTS AND THE EVOLUTION OF THE MANTLE
Don L. Anderson [1979] 33 p refs
(Grant NGL-05-002-069)
(NASA-CR-162906; Contrib-3432) Avail: NTIS HC A03/MF A01 CSCL 08G

Trace element patterns show that continental and ocean island basalts are complementary to mid-ocean ridge basalts (MORB). The relative sizes of the two source regions can be estimated from enrichment/depletion patterns. Their combined volume, computed from estimates of whole mantle abundances, occupies the entire upper mantle. The source regions appear to be the result of an early differentiation of the mantle. The MORB source evolved from the melt fraction which lost its late stage enriched fluids to the overlying plume source. The MORB source is primarily garnet and clinopyroxene, consistent with it being an eclogite cumulate. Author

VALIDATION OF THE DAIRCHEM CODE 1: QUIET MIDLATITUDE CONDITIONS
Melvin G. Heaps and Joseph M. Heimerl Sep. 1979 42 p refs
(DA Proj. 1L1-61102-B-53A)
(AD-A077880; ERADCOM/ASL-TR-0041) Avail: NTIS HC A03/MF A01 CSCL 04/1

Two long-standing problems in the atmospheric sciences have been the correct modeling of the ion chemistry in the earth's atmosphere and the proper determination of the ion species and densities through in situ measurements. Comparison between experimental data and simulations of those data by computer modeling of atmospheric chemistry is a means of validating the computer code as well as indicating which processes are in need of further study. The DAIRCHEM computer code is used here to simulate data taken in the midlatitude D region during quiet conditions. Comparison between the total positive ion density profile derived from rocket measurements and the one computed by the code shows very good agreement in the 30 to 90 km range, with the exception that the simulated ion density profile is of somewhat smaller magnitude that the experimental one in the 60 and 75 km region. Such a discrepancy is only partially explained by the uncertainties in the ionization rate of NO due to Lyman alpha radiation. Comparison between the measured and the computed electron density profiles shows that the measured profile is consistently of a smaller magnitude that the computer profile in the 65 and 85 km range. PRELIMINARY REPORT OF NUMERICAL SIMULATIONS OF INTERMEDIATE WAVELENGTH ExB GRADIENT DRIFT INSTABILITY IN IONOSPHERIC PLASMA CLOUDS
M. J. Keskinen, S. L. Ossakow, and P. K. Chaturvedi (Berkeley Research Associates, Arlington, Va.) 26 Nov. 1979 24 p
(AD-A079313; NRL-MR-4116; AD-E000344) Avail: NTIS HC A02/MF A01 CSCL 04/1

Two dimensional numerical simulations of intermediate wavelength (100-1000m) ExB gradient-drift instability in local unstable regions of large F region ionospheric plasma clouds were performed, using an initial one dimensional (y), cloud geometry, for plasma cloud density gradient scale lengths L - 3, 6, 10 km. For conditions typical of 200 km barium releases, it was that linearly unstable modes saturated by nonlinear generation of linearly damped modes along the y direction (parallel to ExB drift). In the nonlinear regime, power laws are observed. These results are compared with recent in situ experimental measurements and theoretical predictions. R.E.S.

N80-20969# Naval Research Lab., Washington, D. C. Plasma Physics Div.
PRELIMINARY REPORT OF NUMERICAL SIMULATION OF INTERMEDIATE WAVELENGTH COLLISIONAL RAYLEIGH-TAYLOR INSTABILITY IN EQUATORIAL SPREAD F Interim Report
M. J. Keskinen and P. K. Chaturvedi (Berkeley Research Associates, Arlington, Va.) 7 Dec. 1979 26 p refs
(DNA Proj. NWET-I25AAXYX960; NRL Proj. H02-42; NRL Proj. A03-16)
(AD-A079307; AD-E000344; NRL-MR-4116) Avail: NTIS HC A03/MF A01 CSCL 04/1

Computer simulations of the intermediate wavelength (100 to 1000 m) collisional Rayleigh-Taylor instability were performed using parameters typical of the post-sunset bottomside (300 km) equatorial F region ionosphere. For ambient electron density gradient scale lengths L - 5, 10, 15 km it was found that the linearly unstable modes saturate by nonlinear generation of linearly damped vertical modes with the result that in the nonlinear regime, power laws are observed in the horizontal and vertical one-dimensional power spectra with n - 2 to 2.5. These results are consistent both with in situ experimental data and theoretical prediction. K.L.

REVIEW OF IONOSPHERIC DISTURBANCES RESULTING FROM SOME NATURALLY OCCURRING EVENTS
M. M. Hoffman Nov. 1979 21 p refs
(Contract W-7405-eng-36)
(LA-7984-MS) Avail: NTIS HC A02/MF A01

Some known and some potential sources of atmospheric disturbances were investigated in a review of scientific papers selected to illustrate the roles of naturally occurring phenomena in generating observable ionospheric effects. Reports of acoustic and ionospheric effects resulting from the Alaskan earthquake of 1964 were used as a guide to the nature of signals generated by all seisms. Scaling these effects to smaller seisms is considered. Some models for enhanced acoustic coupling between the earth and atmosphere are discussed. Investigations of signals generated within the atmosphere by meteorological events are also reviewed. DOE

CHARACTERIZATION AND ANALYSIS OF DEVONIAN SHALES AS RELATED TO RELEASE OF GASEOUS HYDROCARBONS Quarterly Progress Report, Jan. - Mar. 1979
R. S. Kalyoncu, J. P. Boyer, and M. J. Snyder 15 Apr. 1979 240 p
(Contract EY-76-C-05-5205)
(ORO-5205-10) Avail: NTIS HC A11/MF A01

This program has the objective of determining the relationships between the shale characteristics, hydrocarbon gas contents, and well location, and thereby provide a sound basis for (1) assessing the productive capacity of the Eastern Devonian Gas Shale deposits and (2) guiding research, development, and demonstration projects to enhance the recovery of natural gas from the shale deposits. The Y-1 well in Allegany County, New York was sampled in September 1978. 412 samples were collected from the Allegany County, New York well. Characterization data on Y-1 (EGSP New York No. 1), Allegany County, New York well is reported and discussed. Analysis of the hydrocarbon gases in Y-1 samples indicates that the longer chain hydrocarbon gases (ethane, propane, butane) in these shales are significantly higher than in previous wells. The carbon contents of the Y-1 (Allegany County, New York) well, on the other hand, are somewhat lower than predicted from the hydrocarbon gas contents. There is still a positive relationship between the carbon and hydrocarbon gas contents, however. A similar relationship is also apparent between the sulfur and hydrocarbon gas contents. No unusual trends are observed in the porosity values, and a reasonable agreement exists between the measured Hg-intrusion values and those calculated from the density data. Higher porosity values are associated with low bulk densities. From limited lithological observations New York shales exhibit variable clay, mineral, and quartz contents. Generally, low levels of pyrite and carbonate minerals are observed. The low pyrite and carbonate contents noted in the powder examination of the samples are supported by the EDAX results showing low Ca and S contents. DOE

OPTIMIZATION OF HORIZONTAL CONTROL NETWORKS BY NONLINEAR PROGRAMMING
Dennis G. Milbert Aug. 1979 50 p refs
(PB80-117948; NOAA-TR-NOS-79-NGS-12; NOAA-79100108)
Avail: NTIS HC A03/MF A01 CSCL 08E

Some practical aspects of horizontal control network design are considered, and the techniques of linear and nonlinear programming are briefly reviewed. Rotationally invariant constrains are written for the coordinate variance sum at each station. These constrains are also quasi-homogeneous in the sense that a Moore-Penrose generalized inverse is used in computation. The objective function to be minimized is a cost proportional to the number of observations. Results are displayed for serval test networks. Methods of improvement of the design algorithm are then discussed. GRA

(PB80-119464; JHU/APL-CP-076) Avail: NTIS HC A05/MF A01 CSCL 04A

A simple atmospheric density model is presented for Transit satellite altitudes (900 to 1200 km), based on 4.3 years (1974-1978) of data for all five Transit System satellites. The model incorporates altitude, solar, magnetic, annual, semiannual, diurnal, and seasonal-latitudinal variations. In addition to these known effects, a month period evidenced in the data was incorporated into the model. Several attempts (using different models) failed to elicit the four angle (local time) component of the diurnal effect. The results lead to the conclusion that diurnal variation is too weak to be detected. GRA

THE PRESENT STATUS OF ATMOSPHERIC ELECTRICITY, REPORT OF THE USRA ATMOSPHERIC ELECTRICITY STUDY PANEL Final Report
M. H. Davis 18 Sep. 1979 18 p
(Grant NSF ATM-78-19247)
(PB80-111479; USRA/BLDR-9/1) Avail: NTIS HC A02/MF A01 CSCL 04B

The present status of research in atmospheric electricity is examined. Recent directions of electrical research are discussed in the context of the atmospheric sciences. It is concluded that research in atmospheric electricity is now well positioned for significant advances, despite its relative isolation and unpopularity. GRA

RESONANCE ZONES ON THE SURFACE OF A DIPPING LAYER DUE TO PLANE SH SEISMIC INPUT
G. L. Wojcik Jan. 1979 99 p refs
(Grant NSF PFR-78-15049)
(PB80-107907; NSF/RA-790200; Rept-11) Avail: NTIS HC A05/MF A01 CSCL 08K

The local effects of lateral geologic inhomogeneity on surface ground motion during earthquakes was studied using a mathematical model. The model consisted of a surface dipping layer overlaying a halfspace, with plane SH waves incident from the halfspace in the downdip direction. Surface motion over the layers calculated for transient (time domain) and harmonic (frequency domain) inputs. An extension of the analysis suitable for Love wave excitation, is described. Applications include seismic zonation, critical facility sitting, building rehabilitation and ground failure. GRA

AN IMPROVED MODEL FOR THE CALCULATION OF LONGWAVE FLUX AT 11 MICROMETERS
P. G. Abel and A. Gruber Oct. 1979 33 p refs
(PB80-119431; NOAA-TM-NESS-106; NOAA-79101901) Avail: NTIS HC A03/MF A01 CSCL 04A

A method for the prediction of outgoing longwave flux from satellite radiance measurements at 11 micrometers is presented. The method offers improved accuracy in estimated flux, especially at extreme flux values. It substantially reduces the discrepancy between the SR and ERB measurements, and also reduces derived outgoing longwave flux in the subtropical regions. GRA

ESTIMATING NOCTURNAL SURFACE TEMPERATURE IN FLORIDA USING THERMAL DATA FROM GEOSTATIONARY SATELLITE DATA
Ellen Yee-Ling Chan Chen 1979 294 p
Avail: Univ. Microfilms Order No. 8005447

Satellite data from the SMS/GOES system were used to study winter nocturnal surface temperature patterns on both a spacial and temporal basis. The areas of special interest were the Everglades Agricultural Area and transects perpendicular to the coast in central Florida. Consistent, persistent thermal patterns were observed which were highly correlated with 1.5 in ambient air temperature observed concurrently. Thermal patterns observed by the satellite on clear, calm nights revealed that the thermal characteristics of the soil/plant surface predominately influence the surface temperature. This influence overshadows latitudinal effects. Water (open, marsh, and soil moisture) was apparently the next most important factor after soil characteristics)organic versus mineral soils). The organic soil of the Everglades Agricultural Area was cold because of the low conductivity, heat capacity and bulk density; however, areas of excessively drained sandy mineral soils were also detectably colder. Dissert. Abstr.

N80-20983 Wisconsin Univ. - Madison.
SUMMER CIRCULATION OVER SOUTH AMERICA FROM SATELLITE DATA Ph.D. Thesis
Hassan Virji 1979 162 p
Avail: Univ. Microfilms Order No. 8004748

Cloud winds obtained from geostationary satellite images for the southern summer are used to describe the tropospheric circulation over tropical and subtropical South America. The cloud winds are objectively interpolated onto a 5 degree grid and the gridded data are used to obtain the diurnal and time-averaged, upper (300-100 mb) and lower (900-700 mb) level tropospheric motion fields. Relative vorticity, horizontal divergence, and rotational and irrotational components of the mean circulation are estimated from the gridded data. The midtropospheric vertical motion field is determined through the kinematic method and the result is compared with estimates obtained from cloud area and heat budget methods using conventional radiosonde data. Upper level momentum and vorticity budgets for the mean circulation are also determined. Dissert. Abstr.

BAND 3, HEFT 1: UNTERSUCHUNG ZUR VORHERSAGE CHARAKTERISTISCHER SYNOPTISCHER STRUKTUREN MIT HILFE EINES NUMERISCHEN MODELLS DER FEUCHTEN ATMOSPHAERE]
Eberhard Reimer Verlag Dietrich Reimer 1977 121 p refs In GERMAN Sponsored by Forschungsgemeinschaft
Copyright. Avail: Verlag Dietrich Reimer, Berlin

The condensation process on a large scale is represented by isentropic surfaces in a model of atmospheric moisture. A system of equations represents the isobaric surface despite difficulties in representing the isentropes in the plane. Thermodynamic calculations applied to the case of condensation and evaporation in the scale of the space are given. The proposed numerical model uses potential temperatures as vertical coordinates, giving improved accuracy. Author (ESA)

SIMULATION STUDY OF A GEOMETRIC SHAPE FACTOR TECHNIQUE FOR ESTIMATING EARTH-EMITTED RADIANT FLUX DENSITIES FROM WIDE-FIELD-OF-VIEW RADIATION MEASUREMENTS

William L. Weaver and Richard N. Green Washington Apr. 1980 29 p refs

(NASA-TP-1629; L-13373) Avail: NTIS HC A02/MF A01 CSCL 04B

Geometric shape factors were computed and applied to satellite simulated irradiance measurements to estimate Earth emitted flux densities for global and zonal scales and for areas smaller than the detector field of view (FOV). Wide field of view flat plate detectors were emphasized, but spherical detectors were also studied. The radiation field was modeled after data from the Nimbus 2 and 3 satellites. At a satellite altitude of 600 km, zonal estimates were in error 1.0 to 1.2 percent and global estimates were in error less than 0.2 percent. Estimates with unrestricted field of view (UFOV) detectors were about the same for Lambertian and limb darkening radiation models. The opposite was found for restricted field of view detectors. The UFOV detectors are found to be poor estimators of flux density from the total FOV and are shown to be much better as estimators of flux density from a circle centered at the FOV with an area significantly smaller than that for the total FOV. J.M.S.

(Contract DI-14-06-D-7587)
(PB80-112048; TDWR/LP-21-1) Avail: NTIS
HC A04/MF A01 CSCL 02B

The relationships between yield, technology, and weather for three crops in a fourteen county region of Texas were quantified

in order to estimate the economic effects of weather modification activities. Multiple regression analysis was used to estimate the crop yield response to assumed increases in average precipitation. The estimates of increased crop production were converted to monetary values and an input-output model was used to give a preliminary estimate of the economic activity generated in the region by increased crop revenues. Results of the study indicate that there are substantial direct increases in agricultural incomes resulting from assumed increases in average precipitation. GRA

THE ECONOMIC EFFECTS OF WEATHER MODIFICATION ACTIVITIES. PART 2: RANGE PRODUCTION AND INTERINDUSTRY ANALYSIS Final Report
Lawrence Lippke Mar. 1979 92 p refs Sponsored by the Office of Atmospheric Resources Management
(Contract DI-14-06-D-7587)
(PB80-112055; TDWR/LP-21-2) Avail: NTIS
HC A05/MF A01 CSCL 02B

The response of range yield to changes in the average amount of precipitation is studied. It is estimated that rainfall during the spring months is very important determining the condition of the range during the rest of the year. More specifically, a 10 percent increase in rainfall in April would have the largest effect on total income to area livestock producers. Studies of the total economic effects of additional rainfall in the Big SpringSnyder area reveals that an estimated increase of 984 thousand dollars to the total income could be realized if March rainfall was increased by 10 percent. GRA

EQUATORIAL PACIFIC OCEAN VARIABILITY-SEASONAL AND EL NINO TIME SCALES Ph.D. Thesis
John Clifton Kindle 1979 148 p
Avail: Univ. Microfilms Order No. 8007470

A nonlinear, single-layer numerical model was used to examine the baroclinic response of the equatorial ocean to time-variable winds. The rectangular model basin extended 1,500 km south of the equator and 15,000 km zonally; open boundary conditions were employed at the southern boundary. Attention is focused on the equatorially trapped wave response to symmetric, zonal time-dependent winds. Numerical simulations of the anomalous El Nino event were performed by initializing the model at some stage of the average seasonal solution and, subsequently, modifying the mean winds in the central and western Pacific. Discussion is focused on the effects of the magnitude, duration and timing of both the relaxation and the subsequent intensification phases. Dissert. Abstr.

DELAWARE SEA GRANT COLLEGE PROGRAM Annual Report, 1977 - 1978
1979 27 p refs
(PB80-122401; NOAA-79102404) Avail: NTIS
HC A03/MF A01 CSCL 08I

The activities of the Delaware Sea Grant College Program in fiscal year 1977-78, in which more than 30 individual research and education projects were carried out in seven major program areas, are summarized. The Delaware phase of the national project was devoted to the study of rip currents. Controlled Environment mariculture has remained a major area of activity and progress. GRA

Chemical and physical data obtained during Georgia Bight Cruise (10-23 April 1978) aboard the R/V Columbus Iselin is presented. The investigation was part of a larger multi-institutional Department of Energy program to understand event scale, physical, chemical and biological processes of the South Atlantic Bight, the continental shelf region from Cape Hatteras to Cape Canaveral. The study reported here is concentrated in the Georgia Bight near Brunswick, Georgia. GRA

(NASA-TM-76119) Avail: NTIS HC A02/MF A01 CSCL 06C

The restraint associated with hypothermia which increases the adrenal activity in rats was investigated. In rats with nomothermia or light hypothermia, the plasma and adrenal corticosterone levels increase at least threefold whatever the duration of restraint. Their return to normal values depends on the duration of the restraint. Exposure to cold produces in free rats a light hypothermia with an increase of the plasma and adrenal corticosterone levels, and in restraint animals an important hypothermia which does not potentiate the stimulation of adrenocortical activity induced by the restraint alone. PLASMA CORTISOL LEVELS AND AUDITORY FUNCTIONING IN HUMANS EXPOSED TO SHORT AND PROLONGED DURATIONS OF NOISE Ph.D. Thesis
Thomas Edward Bennett 1979 154 p
Avail: Univ. Microfilms Order No. 8005976

Audiometric and hormonal effects of noise exposure were studied in male and female subjects exposed to moderately intense noise (85 dBA, broadband, pink noise) for short and prolonged durations. The major focus was on: (1) characterizing changes in circulating cortisol levels (using radioimmunoassay) before, during, and after noise exposure; (2) measuring the effects of noise on three facets of auditory perception (pure tone threshold sensitivity, level of initial masing perception, and loudness discrimination ability); and (3) examining possible relationships among duration of noise exposure, curculating hormone levels, and hearing ability in male and female human subjects. It was established that noise exposure results in a decreased ability to detect pure tones (threshold shifts), an increased ability to detect changes in loudness (a recruitment phenomenon), and a decreased ability to detect, tones in the presence of background noise (discrimination impairments). Dissert. Abstr.

INITIAL DYNAMICS OF THE EKG DURING AN ELECTRICAL DEFIBRILLATION OF THE HEART
I. I. Bikov, Ya. P. Chebotarov, and V. G. Nikolaev Apr. 1980 12 p refs Transl. into ENGLISH from Fiziol. Zh. Akad. Nauk Ukr RSR (USSR), v. 15, no. 3, 1969 p 322-327 Transl. by Kanner (Leo) Associates, Redwood City, Calif.
(NASA-TM-76002) Avail: NTIS HC A02/MF A01 CSCL 06P

In tests on 11 mature dogs, immobilized by means of an automatic blocking and synchronization system, artefact free EKG were obtained, beginning 0.04-0.06 sec after passage of a defibrillating current. Different versions of the start of fibrillation were noted, in application of the defibrillating stimulus in the early phase of the cardiac cycle. A swinging phenomenon, increasing amplitude, of fibrillation was noted for 0.4-1.5 sec after delivery of a subthreshold stimulus. Conditions for a positive outcome of repeated defibrillation were found, and a relationship was noted between the configuration of the exciting process with respect to the lines of force of the defibrillating current and the defibrillation threshold. It was shown that the initial EKG dynamics after defibrillation is based on a gradual shift of the pacemaker from the myocardium of the ventricles to the sinus node, through phases of atrioventricular and atrial automatism. COLD SHIVERING ACTIVITY AFTER UNILATERAL DESTRUCTION OF THE VESTIBULAR APPARATUS
G. I. Kuzmina. Mar. 1980. 11 p. refs. Transl. into ENGLISH from Fiziol. Zh. SSSR (USSR), v. 65, no. 11, 1979. p 1655-1660. Transl. by Kanner (Leo) Associates, Redwood City, Calif.
(NASA-TM-76099) Avail: NTIS HC A02/MF A01 CSCL 06P

The bioelectric activity of muscles (flexors and extensors of the forelimbs and hindlimbs) during cold shivering after unilateral destruction of the vestibular apparatus. It was found, that unilateral delabyrinthing produces bilateral facilitation of cold shivering in the flexor extremities more pronounced on the ipsilateral side. In the extensor muscles there was an absence of bioelectric activity both before and after delabyrinthing. Enhancement of cold shivering in the flexor extremities following intervention was evidently conditioned by removal of the inhibiting effect of the vestibulary apparatus on the function of special centers. EFFECTS OF HYPOKINESIA AND HYPODYNAMIA ON THE INTRAORGANIC ARTERIES OF THE HEART
L. A. Aleksina. Mar. 1980. 7 p. refs. Transl. into ENGLISH from Arkh. Anat., gistol. embriol. (USSR), v. 61, no.11, 1971. p 92-95. Transl. by Kanner (Leo) Associates, Redwood City, Calif.
(Contract NASw-3199)
(NASA-TM-76069) Avail: NTIS HC A02/MF A01 CSCL 06S

The experiments were performed on rabbits kept in small cages for 2-12 weeks. Their motor activity was greatly restricted. The arteries of the heart were injected with an India ink-gelatine mass; injection was directly into the coronary arteries. After fixation in 10% formaline solution 120 micron sections were cut. These were cleared by the Malygin method and examined with a light microscope. After exposure to hypokinetic conditions the picture of the cardiac arterial bed changed. During the first weeks the capillaries of the myocardium were significantly constricted, their course becoming sinuous. With prolonged exposure to hypokinetic conditions the vessels were found to dilate gradually and myocardial architectonics changed. Author

MODEL FOR MEASURING THE HEALTH IMPACT FROM CHANGING LEVELS OF AMBIENT AIR POLLUTION: MORBIDITY STUDY
Tsukasa Namekata, Bertram W. Carnow, Zanet Flournoy-Gill, Eileen B. OFarrell, and Domenic Reda. Aug. 1979. 74 p. refs.
(Contract EPA-68-02-2492)
(PB80-107030; EPA-600/1-79-024) Avail: NTIS HC A04/MF A01 CSCL 06T

The relationship between human health and ambient air concentrations of the major pollutants in the city of Chicago is examined using linear regression models to quantitatively estimate the degree of the air pollution contribution to emergency room visits for cardiac and respiratory diseases. According to the results, sulfur dioxide based on patient exposure levels accounts for about 13% of the variation of emergency room visits for acute bronchial and lower respiratory infections and about 22% for total cardiac diagnoses. Nitric oxide based on measurements from the closest site to the hospitals can account for about 7% of the variation of visits for total respiratory diagnoses, 6% for allergic conditions and upper respiratory infections, 4% for total cardiac diagnoses and 4% for hypertension and vascular heart diseases. ABSORPTION CHARACTERISTICS OF PROLATE SPHEROIDAL MODEL OF MAN AND ANIMALS AT AND NEAR RESONANCE FREQUENCY. Final Report, 15 Sep. 1976 - 15 Mar. 1978

Vijai K. Tripatai and Hyuckjae Lee. Aug. 1979. 74 p. refs.
(Grant EPA-R-804697)
(PB80-108293; EPA-600/1-79-025) Avail: NTIS
HC A04/MF A01 CSCL 06R

The absorption characteristics of prolate spheroidal models consisting of homogeneous biological tissues radiated with plane waves at an arbitrary angle of incidence at and near the resonance frequency were evaluated. A general formulation of Stevenson's method in the third approximation is presented which can be applied to an arbitrary angle of incidence and leads to an improvement in frequency range of validity and accuracy as compared with first order solutions. The extended boundary condition emthod is also presented since it was found to be inplementable for realistic models at frequencies approaching resonance. GRA

K-LINES: A THEORY OF MEMORY
Marvin Minsky. Jun. 1979. 25 p. refs.
(Contract N00014-79-C-0260)
(AD-A078116; AI-M-516) Avail: NTIS HC A02/MF A01 CSCL 05/10

Most theories of memory suggest that when we learn or memorize something, some representation of that something is constructed, stored, and later retrieved. This raises questions like: How is information represented? How is it stored? How is it retrieved? Then, how is it used? This paper tries to deal with all of these at once. When you get an idea and want to remember it, you create a K-line for it. When later activated, the K-line induces a mental state resembling the one that created it. A partial mental state is a subset of those mental agencies operating at one moment. This view leads to many ideas about the development, structure and physiology of Memory, and about how to implement frame-like representations in a distributed processor. GRA

HC A10/MF A01 CSCL 01/2

An analysis of the total accident experience of U.S. certificated air-route carriers reveals that there is no evidence that a flight-deck crew of two in an appropriately designed aircraft is less safe than a crew of three pilots. A review of the procedures followed in the airworthiness certification of recent U.S. air carrier aircraft indicates that manufacturers have demonstrated pilot workload in a fully modern and competent fashion, under the cognizance of FAA, and that actual crew complement approval is based on both the results of the workload demonstrations and the experience gained in a significant flight test program. HUMAN COMFORT RESPONSE TO DOMINANT RANDOM MOTIONS IN LONGITUDINAL MODES OF AIRCRAFT MOTION
Ralph W. Stone, Jr. Jan. 1980. 130 p. refs.
(Contract NAS1-14908)
(NASA-CR-159186; UVA/528156/MAE-CE79/130) Avail: NTIS HC A07/MF A01 CSCL 05H

The effects of random vertical and longitudinal accelerations and pitching velocity passenger ride comfort responses were examined on the NASA Langley Visual Motion Simulator. Effects of power spectral density shape were studied for motions where the peak was between 0 and 2 Hz. The subjective rating data and the physical motion data obtained are presented without interpretation or detailed analysis. There existed motions in all other degrees of freedom as well as the particular pair of longitudinal airplane motions studied. These unwanted motions, caused by the characteristics of the simulator may have introduced some interactive effects on passenger responses. J.M.S.

This report summarized the work performed during the first year, dealing with two tasks. The first task, entitled 'Human Engineering Survey and Analysis', reviews the current flap panel display technologies, a summary of the human operator-critical characteristics of each technology, a technical summary of relevant human operator visual characteristics, and an evaluation of each technology by current visual display theoretical evaluation approaches. The second task, entitled 'Hue/Luminance Contrast Tradeoffs,' involved laboratory research designed to develop a metric by which luminance contrast and chrominance contrast can be traded off in display design to provide a metric of total effective display contrast. Work to date on both these tasks is summarized in this report. GRA

ESTABLISHMENT OF THE REPEATABILITY OF PERFORMANCE OF THE SA103C THREE YEAR OLD CHILD TEST DUMMIES Final Report, Sep. 1978 - Jun. 1979
Kenneth N. Naab and Stephen A. Baum. Jun. 1979. 137 p. refs.
(Contract DOT-HS-8-02022)
(PB80-112204; CALSPAN-6385-V-1; DOT-HS-805-071) Avail: NTIS HC A07/MF A01 CSCL 13L

The performance repeatability of four SA103C three year old child test dummies was investigated. The primary measures of dummy sled test performance analyzed with the statistical methods were: (1) peak head resultant acceleration; (2) peak chest resultant acceleration; (3) maximum head horizontal displacement and (4) maximum knee horizontal displacement. An analysis of the absolute deviations of each data point from the overall means demonstrated that the dummy variations were within an acceptable level for all performance measures. In addition, performance comparison overlay time history graphs are presented for direct comparisons. GRA

MIL-M-38510/470 TEST VECTORS: FAULT DETECTION EFFICIENCY MEASUREMENT VIA HARDWARE FAULT SIMULATION Final Report, Nov. 1979 - Mar. 1980
Constantin C. Timoc. 10 Mar. 1980. 67 p. refs. Prepared for JPL.
(Contracts NAS7-100; JPL-955502)
(NASA-CR-162916; JPL-9950-308) Avail: NTIS HC A04/MF A01 CSCL 09B

The stuck fault detection efficiency of the test vectors developed for the MIL-M-38510/470 NASA was measured using a hardware stuck fault simulator for the 1802 microprocessor. Thirty-nine stuck faults were not detected out of a total of 874 injected into the combinatorial and sequential parts of the microprocessor. Since undetected faults can create catastrophic errors in equipment designed for high reliability applications, it is recommended that the MIL-M-38510/470 NASA be enhanced with additional test vectors so as to achieve 100% stuck fault detection efficiency. K.L.

AUTOMATED SYNTHESIS OF DIGITAL HARDWARE MODULES: SIMULATION AND VERIFICATION OF INTERCONNECTIONS Final Report, 1 Jun. 1978 - 31 Aug. 1979
Alice C. Parker and Donald E. Thomas. 31 Oct. 1979. 18 p. refs.
(Grant DAAG29-73-G-0070)
(AD-A078463; ARO-13670.16-EL) Avail: NTIS HC A02/MF A01 CSCL 09/2

The research described in this final report involves two basic areas: automated design and optimization of digital hardware, and simulation and verification of interconnections between digital system modules. Both of these are part of the CMU-DA (Design Automation) project (formerly called the RT-CAD project). We have investigated strategies for computer-aided optimization of the control part of digital systems hardware by developing a discrete optimization technique and a strategy for applying this technique. In addition, we have developed a design aid for computer interconnection evaluation by simulation techniques. Finally, we have begun to design a system to formally verify that a description of interconnections is functionally correct. GRA

Geometrical analysis techniques are used to derive computer memory system characteristics to support a hypothetical but realistic Air Force tactical mission scenario. Commercially available computer memory systems which might fulfill this requirement are reviewed and found unsuitable. Four emerging technologies which appear to have potential for fulfilling this requirement in the mid-1980's are reviewed and projected characteristics of a suitable capacity system based on each technology derived. The most promising technology, magnetic bubble memory, is examined and a major barrier to development is found to be the accurate characterization of materials supporting micron-sized magnetic bubbles. Standard techniques are examined for characterization of materials supporting very small magnetic bubbles. The failing of all techniques is optical microscopic resolution of these bubbles.

Three new techniques for this characterization, based on magnetic susceptibility changes with applied magnetic field, are examined and found to be suitable for small magnetic bubbles. A fast running Control Data Corporation (CDC) FORTRAN extended computer analysis program is described for analyzing experimental data and calculating all the static bubble materials parameters. GRA

HIGH ORDER FINITE DIFFERENCE METHODS FOR ELLIPTIC BOUNDARY VALUE PROBLEMS Ph.D. Thesis
Ronald Fernand Boisvert 1979 200 p
Avail: Univ. Microfilms Order No. 8005835

An analysis of high order finite difference methods (HODIE) for the solution of linear elliptic boundary value problems in bounded regions of the plane, with particular attention to the Helmholtz problem is presented. The method attains high order accuracy while using only a compact nine point stencil whose coefficients are O(h) perturbations of a standard nine point discretization of the Laplacian (no derivative information is required). The implementation of a HODIE method for the Dirichlet problem for the Helmholtz equation on a rectangle is examined. The basic HODIE difference equation is then extended to handle mixed boundary conditions and nonrectangular domains. A fourth order discretization of the Helmholtz equation on a rectangle with constant coefficient mixed boundary conditions using a compact stencil is derived. Dissert. Abstr.

ADAPTATION AND OPTIMIZATION OF A LINE-BY-LINE RADIATIVE TRANSFER PROGRAM FOR THE STAR-100 (STARSMART)
Pamela L. Rarig Hampton, Va. NASA Langley Res. Center Mar. 1980 34 p refs
(Contract NAS1-15481)
(NASA-CR-159238) Avail: NTIS HC A03/MF A01 CSCL 09B

A program to calculate upwelling infrared radiation was modified to operate efficiently on the STAR-100. The modified software processes specific test cases significantly faster than the initial STAR-100 code. For example, a midlatitude summer atmospheric model is executed in less than 2% of the time originally required on the STAR-100. Furthermore, the optimized program performs extra operations to save the calculated absorption coefficients. Some of the advantages and pitfalls of virtual memory and vector processing are discussed along with strategies used to avoid loss of accuracy and computing power. Results from the vectorized code, in terms of speed, cost, and relative error with respect to serial code solutions are encouraging. K.L.

REGION REPRESENTATION RASTER-TO-QUADTREE CONVERSION
Hanan Samet May 1979 30 p refs
(Contract DAAG53-76-C-0138; DARPA Order 3206)
(AD-A078086; TR-766) Avail: NTIS HC A03/MF A01 CSCL 05/8

An algorithm is presented for constructing a quadtree for a binary image given its row-by-row description. The algorithm processes the image one row at a time and merges identically colored sons as soon as possible so that a minimal size quadtree exists after processing each pixel. This method is spacewise superior to one which reads in an entire array and then attempts to build the quadtree. Analysis of the algorithm reveals that its execution time is proportional to the number of pixels comprising the image. GRA

DESIGN AND PERFORMANCE OF LOCAL COMPUTER NETWORKS Ph.D. Thesis
John F. Shoch 1979 216 p
Avail: Univ. Microfilms Order No. 8006353

Alternative architectures for local computer networks are compared and a systematic effort to measure the performance characteristics of one such network is presented. Most networks fall into one of five major families: (1) partially connected systems using store-and-forward techniques; (2) star networks or hierarchical configurations; (3) rings and loops; (4) radio based approaches using packet broadcasting; and (5) multiaccess bus structures. From evaluation and analysis, one of the most attractive designs is found to be the use of a shared passive bus, run with a distributed control procedure. Performance of a system of this type is measured under conditions of normal load, high load, and overload. Under normal load there are very few errors, low delay, and the network easily supports the offered traffic. Under extremely high load the network utilization remains high (over 97%) and the sytem does not become unstable.

The behavior of the closed loop eigenstructure of a linear system with output feedback is analyzed as a single parameter multiplying the feedback gain is varied. An algorithm is presented that computes the asymptotically infinite eigenstructure, and it is shown how a system with high gain, feedback decouples into single input, single output systems. Then a synthesis algorithm is presented which uses full state feedback to achieve a desired asymptotic eigenstructure.

HC A05/MF A01 CSCL 13/8

This project is concerned with the study of the behavior of a particular stochastic system, the magnetic suspension system, under the application of the Sensitivity Adaptive Feedback with Estimation Redistribution (SAFER) Control Algorithm. Matrix factorization techniques are used in the controller and estimator design for the system. Simulation results indicate that the magnetic suspension system can operate satisfactorily under the SAFER control method; and factorization techniques indeed enhance the numerical stability of computations. However, due to the complex structure of the SAFER control method, real time application of the algorithm may require faster computing device or simplified mathematical model. Its application will be most pertinent to system with slow time constants.

HC A06/MF A01 CSCL 12/1

We introduce a method for reduction of a class of distributed parameter control systems to a corresponding control canonical form which has the same intermediate 'control Jordan form' as the original system. Using this reduction together with certain results concerning the completeness and independence properties of complex exponentials we are able to study the problem of eigenvalue specification (pole placement for certain classes of hyperbolic systems which are more general than those discussed in the earlier paper).

(Contract N00014-77-C-0389)
(AD-A077708; AI-TR-515) Avail: NTIS HC A04/MF A01
CSCL 13/8

Compliant motion occurs when the manipulator position is constrained by the task geometry. Compliant motion may be produced either by a passive mechanical compliance built into the manipulator, or by an active compliance implemented in the control servo loop. The second method, called force control, is the subject of this report. In particular, this report presents a theory of force control based on formal models of the manipulator and the task geometry. The ideal effector is used to model the manipulator, and the task geometry is modeled by the ideal surface, which is the locus of all positions accessible to the ideal effector. Models are also defined for the goal trajectory, position control, and force control. These models are useful in two respects. First, the model of force control provides precise semantics for force control primitives in manipulator programming languages. The model also defines a simple interface between the manipulator and the programmer, isolating the programmer from the fundamental complexity of low-level manipulator control.

Second, the formalism provides a method of synthesizing force control programs for compliant motion. A force control program is modeled as a set of equations in the components of manipulator velocity (angular velocity) and force (torque). The task geometry constraints can be modeled similarly. GRA

RESULTS ON SUPERCOMPACT CARDINALS Ph.D. Thesis
Julius Barry Barbanel 1979 101 p
Avail: Univ. Microfilms Order No. 8005631

Various aspects of the notion of supercompactness are explored. The elementary embeddings that are associated with normal ultrafilters on supercompact cardinals are examined. In particular, a characterization based upon cofinality is established of which cardinals are fixed points of the embeddings. Given a supercompact cardinal, the collection of all associated normal ultrafilters can be put into a nice tree structure using the restriction operation on normal ultrafilters. The notion of an extendable normal ultrafilter is also discussed. It is established that every level has at least one nonextendible element, and that some levels have many non-extendible elements. Finally it is shown how assumptions about large cardinals above a supercompact cardinal yield additional structure information about the tree of normal ultrafilters. Dissert. Abstr.

N80-21058 Oregon State Univ., Corvallis.
NONLINEAR DIFFRACTION THEORY BY AN EIGENFUNCTION EXPANSION OF THE GREEN'S FUNCTION Ph.D. Thesis
Min-Chu Chen 1980 179 p
Avail: Univ. Microfilms Order No. 8007119

A second-order nonlinear diffraction theory is developed and discussed for a large diameter circular cylinder under the action of surface gravity waves of finite amplitude in water of finite depth. Boundary value problems are derived by using a perturbation expansion and the solutions for the diffracted waves are given in terms of Fredholm integral equations in which the resolvent kernel is a Green's function. Green's functions are obtained by the eigenfunction expansion method and the velocity potentials for the diffracted waves are recovered from Fredholm integral equations which incorporate the prescribed inhomogeneous boundary conditions and the Green's functions. Green's functions are extended to the second-order boundary value problem by an expansion in a complete set of orthonormal eigenfunctions. The dimensionaless hydrodynamic forces and moments on the cylinder are presented. Dissert. Abstr.

SHAPE SEGMENTATION USING RELAXATION
Wallace S. Ruthowski, Shmuel Peleg, and Azriel Rosenfeld May 1979 31 p refs
(Contract DAAG53-76-C-0138; DARPA Order 3206)
(AD-A078084; TR-762) Avail: NTIS HC A03/MF A01 CSCL 05/8

Relaxation is applied to the segmentation of closed boundary curves of shapes. The ambiguous segmentation of the boundary is represented by a directed graph structure whose nodes represent segments, where two nodes are joined by an arc if the segments are consecutive along the boundary. A probability vector is associated with each node; each component of this vector provides an estimate of the probability that the corresponding segment is a particular part of the object. Relaxation is used to eliminate impossible sequences of parts, or reduce the probabilities of unlikely ones. In experiments involving airplane shapes, this almost always results in a drastic simplification of the graph, with only good interpretations surviving.Author (GRA)

A RECURSIVE LAGRANGIAN FORMULATION OF MANIPULATOR DYNAMICS AND A COMPARATIVE STUDY OF DYNAMICS FORMULATION COMPLEXITY
John M. Hollerbach Jun. 1979 26 p refs
(Contract N00014-77-C-0389)
(AD-A078067; AI-M-533) Avail: NTIS HC A03/MF A01 CSCL 05/8

A recursive formulation of manipulator dynamics based on the Lagrange equations has been developed. The efficiency of this formulation allows the dynamics to be computed in real time. The formulation is analogous to recently developed recursive Newton-Euler dynamics and shares the latter's efficiency. A

comparison of the number of adds and multiplies required under different Lagrangian, Newtonian, and tabular formulations shows that recursive formulations based either on the Lagrange or on the Newton equations offer the overall best method of dynamics calculation. GRA

APPLICATION OF BAYESIAN APPROACH TO UPDATING AIR FRAME CERs M.S. Thesis
Walter D. Dietrich. Sep. 1979. 179 p. refs.
(AD-A077064; AFIT/GSM/SM/76D-30) Avail: NTIS HC A09/MF A01 CSCL 15/5

This study investigates a Bayesian approach for developing a parametric equation which will estimate the recurring cost of the next lot/unit of an airframe program. Recurring costs are predicted because definitionally these costs are expected to reflect the cost for a follow-on production unit. Although the data base used for this study consisted of production cost information, the Bayesian approach may be useful for providing a parametric estimate of production cost using recurring costs from a prototype effort. However, until definitional problems associated with separating engineering and tooling costs into recurring and nonrecurring categories are resolved, predictions of production or next unit engineering and tooling costs will be marginal. Because of the definitional problem, total cost, (nonrecurring and recurring) was used in this study to develop Bayesian updated CERs for the engineering and tooling categories. GRA

SOME NEW MATHEMATICAL METHODS FOR VARIATIONAL OBJECTIVE ANALYSIS USING SPLINES AND CROSS VALIDATION
Grace Wahba and James Wendelberger. Sep. 1979. 38 p. refs.
(Contract N00014-77-C-0675; Grant NSF ATM-75-23223)
(AD-A079302; UWIS-DS-578) Avail: NTIS HC A03/MF A01 CSCL 12/1

Sasaki (1960) introduced the idea of numerical variational analysis for objective analysis of meterological fields. In the most general form of variational analysis considered here we seek a function phi(x,y,p,t,) of four variables representing a meteorological field of interest, say height, temperature, or a component of the wind field, as a function of ground projection coordinates (x,y), the vertical coordinate p, and time, t. This function should be suitably close to the height, temperature or wind field as measured at a finite set of positions, pressures and times, it should reflect known behavior of such fields, and it should be 'smooth' in some sense. GRA

THE BOLTZMANN EQUATION WITH A SOFT POTENTIAL. PART 1: LINEAR, SPATIALLY-HOMOGENEOUS Summary Report
Russell Caflisch. Oct. 1979. 42 p. refs.
(Contract DAAG29-75-C-0024; Grants NSF MCS-78-09525; NSF MCS-76-07039)
(AD-A079706; MRC-TSR-2005) Avail: NTIS HC A03/MF A01 CSCL 12/1

The Boltzmann equation describes the evolution of a large system of particles. The configuration of particles changes due to the motion of the particles and the collisions of particles. The collisions proceed according to the force law between particles. The 'soft' forces considered here are ones for which the total effect of collisions is smaller for a particle of higher energy. If the system is close to equilibrium, then its evolution can be described approximately by linear equations. In this paper the linear Boltzmann equation with a soft potential is solved for all time. Previously only 'hard' potentials had been considered. GRA

ON THE MAXIMALITY OF THE SUM OF TWO MAXIMAL MONOTONE OPERATORS
H. Attouch. Nov. 1979. 13 p. refs.
(Contract DAAG29-75-C-0024)
(AD-A079724; MRC-TSR-2018) Avail: NTIS HC A02/MF A01 CSCL 12/1

A wide variety of problems involving nonlinear partial differential equations, subject to boundary conditions, may be shown to have solutions by establishing that the associated differential operators satisfy a certain technical condition. This condition, called maximal monotonicity, allows the use of a well developed abstract theory which includes results about existence, regularity, etc., of solutions of operator equations. It is quite useful, therefore, to have easily verified conditions which imply that an operator is maximal monotone. Frequently an operator may be regarded as the sum of simpler components. This paper gives a new sufficient condition which guarantees that the sum

of two maximal monotone operators is again maximal monotone. GRA

A GLOBALLY CONVERGENT BALL NEWTON METHOD Summary Report
K. L. Nickel. Nov. 1979. 34 p. refs.
(Contract DAAG29-75-C-0024)
(AD-A079728; MRC-TSR-2022) Avail: NTIS
HC A03/MF A01 CSCL 12/1

A new n-dimensional Newton method is presented. In each step a whole n-dimensional ball is determined rather than a single new approximation point. This ball contains the desired zero of the given function. The method is globally convergent. If the given initial ball does not contain any zero, then the method stops after a finite number of steps. Depending upon the assumptions which are made, the convergence of the ball radii is linear, superlinear or quadratic. Author (GRA)

HC A03/MF A01 CSCL 12/1

Some existence results for T periodic solutions of (0.1) were presented in (1) for superquadratic Hamiltonian systems using finite dimensional minimax arguments together with estimates suitable to pass to a limit. An improved existence mechanism was introduced in (2) and applied to some of the superquadratic problems of (1) as well as to several subquadratic cases. It will show here that these problems possess not only one T periodic solutions z sub 1 but infinitely many distinct subharmonic solutions z sub k. A word of caution must be entered at this point. Although z sub k has period kT, it may not be the case that z sub k has minimal (i.e., primitive) period kT. Indeed simple examples show that there may be an upper bound on the minimal period of z sub k. GRA

HC A03/MF A01 CSCL 12/1

Techniques useful for efficiently time-stepping Galerkin methods for various types of time-dependent partial differential equations are presented and analyzed. Second-order quasilinear hyperbolic problems with smooth solutions are studied as a simple model problem for illustrating the widely applicable techniques. The procedure involves the use of a preconditioned iterative method for approximately solving the different linear systems of equations arising at each time-step in a discrete-time Galerkin method. Optimal order L2 spatial errors and almost optimal order work estimates are obtained for the second-order hyperbolic equation. Author (GRA)

Generalizations of multistep and one-leg methods were defined for implicit differential systems with algebraic constraints. Such systems occur frequently in circuit analysis. An error analysis was carried out for three particular methods of this type, associated with an A(0) - contractive second-order Adams formula resulting from earlier research under this contract. Successful numerical tests of these methods were carried out. A complete set of affine invariants was derived for all two-by-two systems of first-order quadratic differential equations. These invariants provide a criterion for deciding to which affine equivalence class any given system belongs. It was shown that each contains a system which is equivalent to a single second-order equation in one unknown. Efficient numerical methods were developed for finding running solutions of the Josephson interferometer equations. Starting from perturbation solutions for small nonlinearities, the problem was formulated as a periodic boundary value problem and solved by finite differences and by continuation with respect to a parameter governing the 'degree of nonlinearity' of the problem. The existence of discontinuum of running solutions of the above mentioned equations was proved for arbitrarily strong nonlinearities with dissipation. For vanishing dissipation, the existence of a continuum of solutions was proved. GRA

DECISION ANALYSIS: ENGINEERING SCIENCE OR CLINICAL ART
D. M. Buede. Nov. 1979. 62 p. refs.
(Contract N00014-79-C-0068; ARPA Order 3668)
(AD-A079035; TR-79-2-97) Avail: NTIS HC A04/MF A01 CSCL 12/1

This paper examines two philosophical poles concerning the structuring of decision-analytic models. The engineering science approach uses complex, engineering-like models to link the decision maker's alternatives to his or her value structure; a computer then calculates the decision-analytic answer. The clinical art approach develops a simple model that structures the decision maker's thoughts concerning a decision in such a way that the critical issues in choosing one alternative over another are readily apparent. Three exemplary applications of each philosophical pole are used to demonstrate that at the extremes, the work of practitioners can be categorized as we describe. A

discussion of the two practical extremes of decision analysis is then presented. In this discussion, dichotomous characteristics are assigned to the decision maker, the decision, and the analyst's constraints to portray conditions under which either the engineering science approach or the clinical approach would be more effective in producing appropriate insight and understanding. Then the implications of each approach are described in terms of the tools and procedure the decision analyst uses. Finally, the selection of the approach the decision analyst might use in any given application is graphically portrayed and discussed in terms of the points made in this paper. GRA

DIFFERENTIAL GEOMETRIC METHODS FOR SOLVING NONLINEAR CONSTRAINED OPTIMIZATION PROBLEMS AND A RELATED SYSTEM OF NONLINEAR EQUATIONS: GLOBAL ANALYSIS AND IMPLEMENTATION
Kunio Tanabe 1978 10 p refs Presented at the Intern. Congr. on Numerical Methods for Eng., Paris, 27 Nov. - 1 Dec. 1978
(Contract EY-76-C-02-0016)
(BNL-26729; CONF-7811143-1) Avail: NTIS HC A02/MF A01

Robust method that can produce convergence from a very poor initial estimate of the optimal solution for larger problems are discussed. A differential geometric method is developed specifically to obtain robust algorithms without resorting to the penalty type approach in particular, a generic class of feasibility-improving gradient acute projection (FIGAP) methods and their Levenberg-Marquardt type modifications is developed for solving the general nonlinear constrained minimization problems. Each method in this class is an amalgamation of a generalized gradient projection method and a generalized Newton-Raphson method which, respectively, take care of reducing the value of the objective function and satisfying constraint equations at the same time. A unified theory is developed for the methods by using extensively the concept of various generalized inverses and related projectors, which facilitates geometric interpretation of the FIGAP methods. GENERAL LEAST-SQUARES FITTING PROCEDURES TO MINIMIZE THE VOLUME OF A HYPERELLIPSOID
E. Alan Wadlinger Oct. 1979 11 p refs
(Contract W-7405-eng-36)
(LA-8096-MS) Avail: NTIS HC A02/MF A01

Several methods for determining the shape parameters, which in two dimensions are the Courant-Snyder parameters, and the volume of an ellipse or hyperellipse that represents a set of phase-space points in a two-or-more dimensional hyperspace are presented. The ellipse parameters are useful for matching a beam to an accelerating or transport system and in studies of emittance growth. The fitting procedure minimizes the total volume of a hyperellipse by adjusting the ellipse shape parameters. The total volume is the sum of the individual particle volume defined by the hyperellipse that passes through a particle's phase-space point. A two dimensional space is considered first; then results are generalized to a higher number of dimensions. DOE

Erik H. Vanmarcke Apr. 1979 64 p refs
(Grants NSF ENV-76-19021; NSF PFR-78-15898)
(PB80-107865; R79-19; NSF/RA-790199) Avail: NTIS HC A04/MF A01 CSCL 12A

Results are presented for the average crossing rate and for the probability distribution of extremes of moving averages or integrals of random processes that are ergodic in the mean. The results are asymptotically exact when the averaging time grows to infinity and provide excellent approximations for all but very small averaging times. Perspectives are provided on the unifying role of the Gaussian random process toward which any stationary random process converges through local averaging or integration. The scale of fluctuation theta sub x is identified as a key parameter of any stationary random process. It is formally defined in terms of the variance function, but it has simple interpretations in terms of the autocorrelation function and the spectral density function. GRA

SOME CONTRIBUTIONS TO GAMMA-MINIMAX AND EMPIRICAL BAYES SELECTION PROCEDURES
Ph.D. Thesis
Ping Hsiao 1979 151 p
Avail: Univ. Microfilms Order No. 8005893

Results on gamma minimax selection procedures and empirical Bayes selection procedure are obtained and discussed. A problem of selecting populations close to a control is considered. It is assumed that there are (k + 1) normally distributed populations.

and one of them is a control population. A zero-one type loss function is defined. Bayes rules, gamma-minimax rules and minimax rules are derived and compared. Secondly the problem of selecting the t-best populations is examined. It is shown that if the populations have Polya Frequency Type 2 densities, then the natural selection rule is a gamma-minimax rule. Finally, a problem of selecting populations better than a control is considered. When the populations are uniformly distributed, empirical Bayes selection rules are derived for a linear loss function for both the known control parameter and the unknown control parameter cases. Dissert. Abstr.

ROBUST PROCEDURES FOR THE MULTIVARIATE NORMAL DISTRIBUTION Ph.D. Thesis
Nancy Jo Klein Delaney 1979 141 p
Avail: Univ. Microfilms Order No. 8004756

Two procedures are presented for joint estimation of location and dispersion parameters at or near the multivariate normal distribution. One procedure is based on characteristic functions and the other is based on a generalized likelihood function. Although of different origin, both procedures yield estimates which are jointly robust, consistent and asymptotically normal. Simulation studies show that these procedures are relatively efficient in normal sampling and out-perform traditional estimators in nonnormal sampling. Both procedures also provide outlier identification measures automatically via self weighting of the observations and protect estimates from distortions which could be caused by such spurious observations. Examples with real data show the application of these procedures to various multivariate analyses. Dissert. Abstr.

CONSISTENT ESTIMATION OF VARIANCE PARAMETERS FROM MANY SMALL SAMPLES WITH DIFFERENT MEANS
Nicholas P. Jewell and Gillian M. Raab (Edinburgh Univ.) Oct. 1979 17 p refs
(Contract N00014-79-C-0322)
(AD-A078227; TR-159-Ser-2) Avail: NTIS HC A02/MF A01 CSCL 12/1

Where sets of observations are normally distributed with variances related to the mean of each set, the mean values become nuisance parameters when we wish to pool information about the variances from a large number of sets of information. This paper considers the problem of obtaining consistent estimators of the variance parameters where no assumptions or prior knowledge are available about the mean values. When the variance is proportional to the square of the mean we obtain an estimator for the constant of proportionality which is always consistent, by a marginal likelihood approach, but this method cannot be generalized to other variance functions. Integrated, modified, and partial conditional likelihood methods are investigated for this example and suggest methods for the general example when the standard deviation is small compared with the mean. The partial conditional likelihood method may be a useful general method of eliminating nuisance parameters in problems where the methods proposed by Kalbfleisch and Sprott (1970) are not applicable. (Contract N00014-79-C-0522)
(AD-A077005; RM-394) Avail: NTIS HC A03/MF A01 CSCL 12/1

Several investigations were made of the notion of local asymptotic normality of a family of probability distributions. The usefulness of this concept in problems of the theory of asymptotic estimation and hypothesis testing was demonstrated. A comprehensive examination of sets of conditions can be found ensuring the Lan for different families of probability distributions. Much attention has been focused on distributions connected with sequences of independent and identically distributed iid observations or those associated with a homogeneous Markov chain. In this paper conditions are presented ensuring the Lan for distribution connected with certain observations, which are neither independent nor identically distributed, when a class of stopping variables is incorporated in a natural way into the basic framework. The primary motivation for our study is the following situation which arises naturally in the context of clinical trials and life tests. GRA

SIMULATING GENERALIZED SEMI-MARKOV PROCESSES
Lawrence D. Fossett Sep. 1979 104 p refs
(Contract N00014-76-C-0578; Grants NSF MCS-75-23607; NSF MCS-79-09139)
(AD-A075549; TR-50) Avail: NTIS HC A06/MF A01 CSCL 12/1

One approach to modeling queueing networks and other complex stochastic systems which has received some attention in the literature is the generalized semi-Markov process (GSMP). This idea is an example of the supplementary variables approach to non-Markovian systems. This approach supplements the natural description of the system by variables which contain information about the past history of the system. In this way, a model of a non-Markovian system can be made Markovian. For GSMPs the supplementary variables are clocks which record the amount of time until the occurrence of various events which could influence the system. Our approach to this problem is to find closely related regenerative processes on which to base the central limit theorem for the process under study. New results in the theory of Markov chains on a general state space make it clear how these regenerative processes can be constructed. GRA

SMOOTHNESS PRIORS AND THE DISTRIBUTED LAG ESTIMATOR
Hirogutu Akaik Aug. 1979 21 p refs
(Contract N00014-75-C-0442)
(AD-A075574; TR-40) Avail: NTIS HC A02/MF A01 CSCL 12/1

Shiller's distributed lag estimator based on a smoothness prior demonstrates the potential of the Bayesian approach to statistical model building. Nevertheless, when the number of significant lag coefficients is small the assumption of smoothness of the pattern of the lag coefficients may not be appropriate. In this paper, to cover such a situation, the smoothness is assumed for the behavior of the coefficients viewed in the frequency domain. This definition leads to a smoothness prior with a particularly simple form. Numerical result shows that the estimator based on this smoothness prior produces good estimates of the lag coefficients where Shiller's prior produces highly biased estimates. It is also observed that the new estimator produces reasonable results even when the Shiller's prior is more appropriate. The danger of introducing a bias by assuming a Bayesian model is stressed in the discussion. GRA

PROPERTIES OF ISOTONIC ESTIMATORS OF MEAN LIFETIME IN A SIMPLE PROTOTYPE DEVELOPMENT MODEL Ph.D. Thesis
Thomas P. McWilliams Aug. 1979 113 p refs
(Contract N00014-75-C-0561)
(AD-A075578; TR-194) Avail: NTIS HC A06/MF A01 CSCL 12/1

Consideration of a simple prototype development/reliability growth model leads to observation of variables X1, X2, ... Xk where the X1 are independent and are assumed to have the same distribution type with individual means lambda sub i. The problem is to estimate the lambda sub i, which are assumed to be non-decreasing due to design improvements in the device under development. For many common distributions, estimation via the restricted maximum likelihood principle leads to estimates which are the isotonic regression of the X1 with appropriate weights. This paper finds the distribution of lambda cap sub k, the mle of lambda sub k, when the X1 are exponentially distributed. Lambda cap sub k is then compared with X-bar and Xk, two competing estimates of lambda sub k. Gamma, normal, and

Weibull distributed X1 are also considered, and the usefulness of lambda cap sub k is seen to depend on the relative magnitude of the variances and means of the X1. Results are also examined when the restricted mles are generated assuming the lambda sub i are a non-decreasing and concave function of 1. GRA

THE USE OF THE TETRACHORIC SERIES FOR EVALUATING MULTIVARIATE NORMAL PROBABILITIES Technical Summary Report
Bernard Harris and Andrew P. Soms Oct. 1979 39 p refs
(Contract DAAG29-75-C-0024)
(AD-A079721; MRC-TSR-2015) Avail: NTIS HC A03/MF A01 CSCL 12/1

The tetrachoric series is a technique for evaluating multivariate normal probabilities frequently cited in the statistical literature. In this paper we have examined the convergence properties of the tetrachoric series and have established the following. For orthant probabilities, the tetrachoric series converges if the absolute value of rho sub ij < 1/(k-1), 1 < or = i <; < or = k, j - or - k, where rho sub ij are the correlation coefficients of a k-variate normal distribution. The tetrachoric series for orthant probabilities diverges whenever k is even and rho ij < 1/(k-1) or k is odd and rho sub ij > 1/(k-2), 1 < or = ; <; < or + k Other specific results concerning the convergence or divergence or divergence of this series are also given. The prinicpal point is that the assertion that the correlation matrix is positive definite is false. GRA

PROBABILISTIC METHOD FOR GROUPING DATA
C. L. Begovich Nov. 1979 191 p refs
(Contract W-7405-eng-26)
(ORNL/CSD/TM-65) Avail: NTIS HC A09/MF A01

A probabilistic method for grouping data was developed to incorporate measurement error into standard cluster analysis procedures. In the analysis, the data are perturbed by Monte Carlo techniques to simulate the experimental error, and the resultant data sets are clustered. By varying the number of clusters, a procedure is given to estimate the unknown number of groups. This technique and other standard procedures for determining the number of groups are described and compared for three different examples. The probabilistic method is shown to have advantages for determining the number of groups and the probabilities for a sample's membership in the hypothesized groups. DOE

BRILLOUIN SCATTERING IN XENON NEAR THE CRITICAL POINT Ph.D. Thesis
Dennis Wonica 1979 241 p
Avail: Univ. Microfilms Order No. 8006480

The behavior of sound in xenon was investigated along the critical isochore and for temperatures .05 - 10 C above a critical temperature of 16.62 C. A laser Brillouin scattering experiment was assembled which used optical heterodyne detection combined with spectrum analysis and signal averaging. Sound velocity and sound attenuation data were obtained for frequencies in the region 1 - 15 MHz. Scattering angles were 0.36, 0.72, 1.44, and 2.69 deg. Electronic and optical instrumental effects were very carefully measured and deconvolved from observed spectra. A nonlinear least squares optimization algorithm was implemented using Fortran and used in a curve fitting procedure to accurately extract the Brillouin shift and Brillouin linewidth, from which the sound velocity and attenuation were determined, respectively. Dissert. Abstr.

DEVELOPMENT AND EVALUATION OF A GENERAL AVIATION REAL WORLD NOISE SIMULATOR Final Report
Eugene Galanter and Richard Popper Mar. 1980 21 p refs (Grant NsG-1541)
(NASA-CR-159237) Avail: NTIS HC A02/MF A01 CSCL 20A

An acoustic playback system is described which realistically simulates the sounds experienced by the pilot of a general aviation aircraft during engine idle, take-off, climb, cruise, descent, and landing. The physical parameters of the signal as they appear in the simulator environment are compared to analogous parameters derived from signals recorded during actual flight operations. The acoustic parameters of the simulated and real signals during cruise conditions are within plus or minus two dB in third octave bands from 0.04 to 4 kHz. The overall A-weighted levels of the signals are within one dB of signals generated in the actual aircraft during equivalent maneuvers. Psychoacoustic evaluations of the simulator signal are compared with similar measurements based on transcriptions of actual aircraft signals. The subjective judgments made by human observers support the conclusion that the simulated sound closely approximates transcribed sounds of real aircraft. K.L.

(NASA-TM-75800) Avail: NTIS HC A03/MF A01 CSCL 20A

The axial propagation of sound waves in a model consisting of parallel fibers is calculated. The viscous forces and the thermal conduction are taken into account. This leads to viscous waves and to thermal waves besides the usual acoustic compression wave. The potential function for the total field near a fiber is treated as the superposition of the radiated field from the fiber itself and of the scattered fields from all the other fibers. The explicit field equations for a regular square fiber arrangement is derived and the influence of the order of symmetry of the arrangement is discussed. This leads to simplifications in the field equations and to field equations for the case of a homogeneous fiber distribution. J.M.S.

SIX-FOOT LINE TRANSDUCER CALIBRATION PROCEDURE: EXPLAINS THEORY, METHODOLOGY, AND PROCEDURES USED AT SENSOR ACCURACY CHECK SITE (SACS), LONG BEACH, CALIFORNIA
Oct. 1979 45 p
(AD-A079522; NOSC/TD-291) Avail: NTIS HC A03/MF A01 CSCL 17/1

This technical document concerns the theory, method, and procedures by which the 6 foot line transducer in the moveable carriage at the Sensor Accuracy Check Site (SACS), Long Beach, California is to be calibrated. The equipment, physical and electronic setup, detailed data acquisition procedure, data quality assurance, and data reporting requirements are included. The procedure results in a measurement-to-measurement repeatability better than -0.7 dB. GRA

RANDOM SIGNAL FLAW DETECTION Final Report, 21 Aug. 1975 - 28 Feb. 1979
Vernon L. Newhouse and Eric S. Furgason Jun. 1979 99 p refs
(Contract F33615-75-C-5252; AF Proj. 2387)
(AD-A078443; AFML-TR-79-4077) Avail: NTIS HC A05/MF A01 CSCL 17/1

This report describes four areas of work. In the first area random signal beam forming techniques are developed which make it possible to transmit several independent beams from a phased array using the same number of incoherent noise sources. Following this ultrasound beam scanning techniques are demonstrated in which random signal correlation systems and RF correlation systems using quadrature phase techniques are used in methods for scanning the intensity profile of ultrasound transducer beams using respectively broadband signals and narrow band signals. In addition two types of deconvolution procedure are described and demonstrated which have been successful in improving the effective resolution of ultrasound correlation systems when viewing surface features. Finally the design and construction of a random signal correlation system is described which uses an electronic delay line. GRA

PARRAY TECHNICAL PAPERS PRESENTED AT SCIENTIFIC AND TECHNICAL MEETINGS
Tommy G. Goldsberry, Voldi E. Maki, Jr., Wiley S. Olsen, C. Richard Reeves, and David F. Rohde 2 Aug. 1979 143 p refs
(Contract N00039-76-C-0231; ARPA Order 2910)
(AD-A077726; ARL-TR-79-4) Avail: NTIS HC A07/MF A01 CSCL 17/1

The parametric acoustic receiving array (PARRAY) exploits the inherent nonlinearity in the pressure-density relationship of water to achieve directional reception of low frequency acoustic waves using only two small high frequency transducers and some associated electronics. This report describes the PARRAY and summarizes several papers on the subject that have been presented at scientific and technical meetings. Copies of the papers are included as appendices. Procedures for selection of optimal parameter values are developed. State of the art advances in stable oscillators, reception of sideband signals with very small modulation indices, and simple high efficiency transducer elements are described. Results of experiments with a 340 m aperture PARRAY are presented which demonstrate that the experimental PARRAY is ambient noise limited in Lake Travis (Texas). GRA

ACOUSTIC EMISSION MONITORING OF STEEL AND CONCRETE STRUCTURAL ELEMENTS WITH PARTICULAR REFERENCE TO PRIMARY NUCLEAR CONTAINMENT STRUCTURES

D. J. Naus 1979 38 p refs Presented at the Intern. Conf. on Acoustic Emission, Anaheim, Calif. 10 Sep. 1979
(Contract W-7405-eng-26)
(CONF-790966-1) Avail: NTIS HC A03/MF A01

Advancements in nondestructive testing utilizing acoustic emission (AE) are discussed in terms of in-service monitoring of the structural integrity of primary containment structures. The capability of AE to monitor the structural integrity of primary nuclear containments was assessed. Intermediate pressure vessels tested under the Heavy-Section Steel Technology (HSST) Program and relatively simple concrete structures were monitored by AE while under test. The results of this monitoring program are discussed. DOE

NOISE MEASUREMENTS AND QUALITY ASSURANCE Final Report, 1977 - 1979
Roger D. Smith and Mas M. Hatano Mar. 1979 131 p refs Sponsored in part by FHA
(PB80-107246; FHWA/CA-79/06; TL-657253) Avail: NTIS HC A07/MF A01 CSCL 20A

A quality assurance program was developed for calibration of noise measurement equipment and the certification of personnel responsible for making noise measurements. The program is designed for use by the eleven districts and the transportation laboratory of the California Department of Transportation (Caltrans). An evaluation of various equipment calibration program alternatives was made and the most suitable to Caltrans' needs was selected and developed in detail. This program involves a mobile calibration and operator testing set-up that can be taken to each District office on an annual basis. Traceability to the National Bureau of Standards (NBS) is established by using standard microphones periodically calibrated by NBS. GRA

COHERENCE IN PENNING IONIZATION AND FIRST KIND COLLISIONS: VOLUME RECOMBINATION OF IONS/ELECTRONS Progress Report, Dec. 1978 - Dec. 1979
L. D. Schearer and W. F. Parks Dec. 1979 27 p
(Contract N00014-75-C-0477; NR Proj. 343-011)
(AD-A079742; Rept-12) Avail: NTIS HC A03/MF A01 CSCL 07/4

A thermal energy beam of helium atoms in the metastable state is used to coherently excite ions of Sr, Ca, and Ba in a Penning collision. The anisotropic excited state distributions appears as Polarized line emission from the excited ions. The degree of ion alignment may be used to determine the populations of the quasi-molecular states of the ion-atom pair. The coherent emission is also utilized to obtain Hanle signals from which the radiative decay rate of the excited ion is determined. This is the first case in which coherence is produced in a collision process involving Penning ionization. The alignment of the Penning ions is an important new parameter in the description of these reactions. In an effort to extend such observations to molecular systems a nitrogen molecular metastable beam source was demonstrated. The use of metal vapor targets and the excitation rate of the excited states of Cd and Zn in energy transfer collisions with the N2(m) enable us to determine the vibrational distribution of the A 3Sigma state of N2 in the beam. Energy transfer cross sections and some Penning cross sections were measured in the beam system. GRA

SECONDARY ELECTRON RADIATION
V. V. Smirnov, ed. Feb. 1979 222 p refs Transl. into ENGLISH of Vtorichnoe Elektronnoe Izluchenie (Leningrad), 1977
(UCRL-Trans-11465; VAAP-SA-79/21) Avail: NTIS HC A10/MF A01

The characteristics of secondary electrons (energy spectra, angular distributions) are discussed using 26 papers on the energy and spatial characteristics of secondary electrons. The studies are directed towards the determination of the yields, spectra, and spatial distribution of secondary electrons, including low energy electrons, forming under the action of photon radiation in materials used for developing ionizing radiation detectors. The processes associated with the passage of electrons of various energies through matter (measurement of the energy loss spectra, degradation spectra, channelling, and shadowing effects) are examined. The development of theoretical methods for the determination of the characteristics of secondary electron radiation

and for the description of processes that accompany the passage of radiation through matter is discussed. A.W.H.

HIGH PRESSURE PHOTOPHYSICS OF ORGANIC MOLECULES Ph.D. Thesis
L. A. Brey 1979 105 p refs
(Contract EY-76-C-02-1198)
(COO-1198-1278) Avail: NTIS HC A06/MF A01

High pressure spectroscopic studies on several classes of organic compounds were made both in fluid solution (to 10 kbar) and in polymeric media (to 40 kbar). Three studies were conducted in fluid solution and concern the effect of solvent viscosity on the nonradiative deactivation rates from electronically excited states. Pressure was utilized to attain high viscosities in organic solvents at room temperature. The primary experimental technique used was fluorescence emission spectroscopy. In the fourth study, observations were made both in fluid solution and in plastic films. The focus of this study was the effect of pressure on the solvent-chromophore dispersion interaction in several polyenes and the concomitant changes in both the radiative and nonadaptive rates from the excited states. Extensive use was made of fluorescence lifetime measurements and excitation spectra. DOE

LASER INDUCED FLUORESCENCE OF TRAPPED MOLECULAR IONS Ph.D. Thesis
F. J. Grieman Oct. 1979 255 p refs
(Contract W-7405-eng-48)
(LBL-10021) Avail: NTIS HC A12/MF A01

An apparatus for obtaining the optical spectra of molecular ions is described. The technique includes the use of three dimensional ion trapping laser induced fluorescence, and gated photon counting methods. The ions, which are produced by electron impact, are confined in a radio frequency quadrupole ion trap of cylindrical design. Because the quadrupole ion trap allows mass selection of the molecular ion desired for study, the analysis of the spectra obtained is greatly simplified. The ion trap also confines the ions to a region easily probed by a laser beam. DOE

KAON-PROTON BACKWARD ELASTIC SCATTERING BETWEEN 476 AND 1084 MeV/c Ph.D. Thesis
Robert Preston Hamilton Sep. 1979 124 p refs
(Contract W-7405-eng-48)
(LBL-8969) Avail: NTIS HC A06/MF A01

The differential cross section for kaon-proton backward elastic scattering was measured in steps of 10 to 20 MeV/c between 476 and 1084 MeV/c. A negative kaon beam was focused onto a 21 cm long liquid hydrogen target and the forward scattered protons were identified kinematically by means of a single arm magnetic spectrometer. A Monte Carlo computer program aided in the subtraction of background events and in the calculation of correction factors. The data have an average statistical precision of 2.5 percent which is an order of magnitude improvement over previous results. Together with a partial wave analysis, the data give additional evidence for a resonance between 1700 and 1725 MeV. DOE

N80-21121# California Univ., Berkeley. Lawrence Berkeley Lab.
NUCLEAR COLLISION AT E/A IS EQUIVALENT TO T/SUB F/
J. Randrup Jul. 1979 23 p refs Presented at the Symp. on Heavy-Ion Phys. from 10-200 MeV/AMU, Upton, N.Y., 16-20 Jul. 1979 Prepared in cooperation with Nordisk Inst. for Teoretisk Atomfysik, Copenhagen
(Contract W-7405-eng-48)
(LBL-9520; CONF-790743-8) Avail: NTIS HC A02/MF A01

A qualitative discussion of nuclear collisions in which the bombarding energy per nucleon is up to the order of the Fermi kinetic energy is presented. The significant processes encountered as bombarding energy increases from a few MeV to energies large in comparison with rest energies are sketched. An estimate of the nucleon mean free path is obtained, and nuclear dynamics

at moderate excitation is discussed. The calculated distribution of promptly emitted neutrons from the collision of 152 MeV C-12 with Gd-158 is shown. DOE

REMOTE EXPERIMENTAL FACILITY TO SOLIDIFY SRP HIGH-LEVEL WASTE
R. M. Galloway, M. J. Plodinec, E. L. Wilhite, and P. H. Chismar 1979 21 p refs Presented at Am. Nucl. Soc. Meeting, San Francisco, 12 Nov. 1979
(Contract EY-76-C-09-0001)
(DP-MS-79-53; CONF-791103-33) Avail: NTIS HC A02/MF A01

A small-scale equipment was developed and installed in a remotely operated experimental facility at the Savannah River Laboratory (SRL) to study immobilization of radioactive waste in glass. The facility has been in operation for nine months. During this period, two 25 liter batches of high-level waste from different SRP waste storage tanks were processed. The waste was boiled in sodium hydroxide to dissolve alumina trihydrate, washed with water to remove soluble salts, dried in a fluid bed dryer, and vitrified in a joule heated melter. Off-gases from the melter were collected for characterization. DOE

SENSITIVITY ON THE PARAMETERS OF THE REGIONAL HYDROLOGY MODEL FOR THE NEVADA NUCLEAR WASTE STORAGE INVESTIGATIONS
R. L. Iman, J. M. Davenport (Texas Tech. Univ., Lubbock), R. K. Waddell (Geological Survey, Denver), H. P. Stephens, and D. I. Leap (Texas Tech. Univ., Lubbock) 1979 31 p refs Presented at 1979 DOE Statistical Symp., Galtinburg, Tex., 24 Oct. 1979
(Contract EY-76-C-04-0789)
(SAND-79-1197C; CONF-791016-3) Avail: NTIS HC A03/MF A01

Statistical methodology was applied to the investigation of the regional hydrologic systems of a large area encompassing the Nevada test site (NTS) as a part of the overall evaluation of the NTS for deep geologic disposal of nuclear waste. Statistical techniques including Latin hypercube sampling were used to perform a sensitivity analysis on a two dimensional finite element code of 16 geohydrologic zones used to model the regional ground-water flow system. The Latin hypercube sample was modified to include correlations between corresponding variables from zone to zone. From the results of sensitivity analysis it was found that: (1) the ranking of the relative importance on input variables between locations within the same geohydrologic zone were similar, but not identical; and (2) inclusion of a correlation structure for input variables had a significant effect on the ranking of their relative importance. The significance of these results is discussed with respect to the hydrology of the region. DOE

SELECTION OF POWER PLANT ELEMENTS FOR FUTURE REACTOR SPACE ELECTRIC POWER SYSTEMS
D. Buden, G. A. Bennett, K. Cooper, K. Davidson, D. Koenig, L. B. Lundberg, R. Malenfant, H. Martz, W. Ranken, and R. E. Riley Sep. 1979 354 p refs
(Contract W-7405-eng-36)
(LA-7858) Avail: NTIS HC A16/MF A01

Various types of reactor designs, electric power conversion equipment, and reject heat systems to be used in nuclear reactor power plants for future space missions were studied. The designs included gas cooled, liquid cooled, and heat pipe reactors. For the power converters, passive types such as thermoelectric and thermionic converters, and dynamic types such as Brayton, potassium Rankine, and Stirling cycles were considered. For the radiators, heat pipes for transfer and radiating surface, and pumped fluid for heat transfer with heat pipes as the radiating surface were considered. A heat pipe reactor design, thermoelectric converters, and a heat pipe radiator were selected. DOE

TEMPERATURES GENERATED BY UNDERGROUND STORAGE OF DEFENSE WASTE CANISTERS
M. H. Tennant 1979 9 p refs Presented at Symp. on the Sci. Basic for Nucl. Waste Management, Boston, 26-29 Nov. 1979
(Contracts EY-76-C-09-0001; DE-AC09-76SR-0001)
(DP-MS-79-37; CONF-791112-11) Avail: NTIS HC A07/MF A01

For conditions conductive to leaching, i.e., moisture in contact with glass, the glass surface temperature would essentially be the canister cavity temperature because temperature rises across wet annuli are small. In turn, canister cavity temperatures are dominated by canister spacing for a given canister power and decay curve. Actual canister powers may be as much as 40% less than those used for these calculations. For dry salt in contact with the storage container, the temperature rises across the annuli may be large. The container temperature would tend to peak earlier for dry annuli than for wet annuli. When canister cavity temperatures peak, salt temperatures would be increased over normal approximately 500 feet in any direction extending from the repository. DOE

NONCONTACTING METHOD FOR MEASURING ANGULAR DEFLECTION Patent
Emmett L. Bryant, inventor (to NASA) Issued 19 Feb. 1980 4 p Filed 23 Oct. 1978 Supersedes N79-11866 (17 - 02, p 0252)
(NASA-Case-LAR-12178-1; US-Patent-4,189,234; US-Patent-Appl-SN-953390; US-Patent-Class-356-152; US-Patent-Class-350-25; US-Patent-Class-350-285; US-Patent-Class-356-150) Avail: US Patent and Trademark Office CSCL 20F

An apparatus is described for indicating the instantaneous angular deflection of an object about a selected axis without mechanical contact with the object. Light from a light source is transmitted through a flat refractor to a converging lens which focuses the light through another flat refractor onto a differential photocell. The first flat refractor is attached to the object such that when the object is deflected about the selected axis the refractor is also deflected about that axis. The two flat refractors are identical and they are placed an equal distance from the converging lens as are the light source and the photocell. The output of the photocell which is a function of image displacement is fed to a high gain amplifier that drives a galvanometer which rotates the second flat refractor. The second refractor is rotated so that the image displacement is very nearly zero making the galvanometer current a measure of the deflection of the object about the selected axis.

OPTICAL DETERMINATION OF THE PROPERTIES OF EXCITONS BOUND TO IMPURITIES IN SEMICONDUCTORS Ph.D. Thesis
Kenneth Robert Elliott 1980 176 p
Avail: Univ. Microfilms Order No. 8006278

The electronic and optical properties of excitons bound to impurities in semiconductors are addressed with emphasis on the electronic structure of bound exciton states. The fundamental process in which a bound exciton is formed on a neutral acceptor in silicon is also reported. Three lines are shown to be in the absorption spectra of the acceptors Al, Ga, and In in silicon. Of the various schemes used to explain these lines, it is determined from the relative oscillator strengths that the correct scheme is one in which two $j=3/2$ holes are coupled to form states with total angular momentum $J=0$ and $J=2$. The cubic environment of the crystal in the neighborhood of the impurity leads to a splitting of the $J=2$ state. In the bound exciton spectra of Si:Tl, it is shown that four lines are in contrast to the three lines observed for the acceptors Al, Ga, and In. Other significant observations as well as the results are reported. Dissert. Abstr.

METHOD AND APPARATUS FOR DOPPLER FREQUENCY MODULATION OF RADIATION Patent Application
Jack S. Margolis (JPL), Daniel J. McCleese (JPL), Michael S. Shumate (JPL), and Clay H. Seamen (JPL) Filed 3 Nov. 1978 13 p Sponsored by NASA
(NASA-Case-NPO-14524-1; NASA-Case-NPO-14527-1; US-Patent-Appl-SN-957452) Avail: NTIS HC A02/MF A01 CSCL 20F

A method and apparatus is disclosed for frequency modulating radiation, such as from a laser, for optoacoustic detectors, interferometers, heterodyne spectrometers, and similar devices using two oppositely reciprocating cat's-eye retro-reflectors to Doppler modulate the radiation. By reciprocally moving both retroreflectors, the center of mass is maintained constant to permit smooth operation at many Hertz. By slightly offsetting the axis of one retroreflector relative to the other, multiple passes a light beam may be achieved for greater Doppler shifts with the same reciprocating motion of the retroreflectors. A Doppler shift of 2(v/c) V sub 0 occurs for each pass.

(Contract NsG-1567)
(NASA-CR-162894; UVA/528171/EE80/102) Avail: NTIS HC A04/MF A01 CSCL 20F

Direct modulation techniques applicable to integrated optics data preprocessors were investigated. Several methods of modulating a coherent optical beam by interaction with an incoherent beam were studied. It was decided to investigate photon induced conductivity changes in thin semiconductor cladding layers on optical waveguides. Preliminary calculations indicate significant changes can be produced in the phase shift in a propagating wave when the conductivity is changed by ten percent or more. Experimental devices to verify these predicted phase changes and experiments designed to prove the concept are described.

best copy available

The construction of directionally selective units, and their use in the processing of visual motion, are considered. The zero-crossings of Delta 2G(x,y)-I(x,y) are located, as in Marr Hildreth (1979). In addition, the time derivative d/dt Delta 2G(x,y)-I(x,y) is measured at the zero-crossings, and serves to constrain the local direction of motion to within 180 degrees. The direction of motion is determined in a second stage by combining the local constraints. The second part of the paper suggests a specific model of the information processing carried out by the X and Y cells of the retina and the LGN, and certain classes of cortical simple cells. A number of psychophysical and neurophysiological predictions are derived from the theory. GRA

PASSIVE INFRARED SURVEILLANCE. PART 1: MODEL FORMULATION Interim Report
Richard A. Steinberg Sep. 1979 43 p refs
(AD-A075603; EOTPO-52; NRL-8320) Avail: NTIS HC A03/MF A01 CSCL 17/4

A new theoretical procedure is presented for calculating the performance of scanning background limited (BLIP) infrared sensors with adaptive threshold signal-processing logic. The performance predictions obtained with this model are background-conditional, i.e., are valid only for a given infrared background scene, presumably specified as a radiance map of arbitrary (but deterministic) structure. The nonstationary statistical nature of the photocurrent is explicitly taken into account. The basic approach involves a combination of some results from optical communications theory with a formalism for the threshold-crossing statistics of nonstationary noises. The present work is pursued further in a companion paper in which various simplifying approximations and illustrative numerical examples are presented. The theory developed in these two papers is directly applicable to design parameter trade-off studies for infrared search and track (IRST) devices. GRA

This paper describes a direct measuring technique for determining the image quality of raster-scanned cathode-ray tube (CRT) displays. This technique is based on the Modulation Transfer Function (MTF) theory and human visual psychophysical data. The rationale for the technique is discussed from a theoretical as well as functional viewpoint. The instrumentation necessary to obtain these measures in manual and automatic modes is discussed. Data obtained using this measurement technique are analyzed and compared with the theoretical performance of the displays. The image quality of new CRT displays procured for the U.S. Army's Advanced Attack Helicopter is being specified and tested using this direct measuring technique. GRA

OPTICAL DETECTION OF FIBER PARTICLES IN WATER Final Report, Mar. 1976 - Sep. 1978
S. R. Diehl, D. T. Smith, and M. Sydor Aug. 1979 73 p
(Grant EPA-R-804361)
(PB80-116866; EPA-600/2-79-127) Avail: NTIS HC A04/MF A01 CSCL 14B

Light scattering by individual particulates is used in a multiple-detector system to categorize the composition of suspended solids in terms of broad particulate categories. The scattering signatures of red clay and taconite tailings, the two primary particulate contaminants in western Lake Superior, along with two types of asbestiform fibers, amphibole, and chrysotile, were studied in detail. A method was developed to predict the concentration of asbestiform fibers in filtration plant samples for which electron microscope analysis was done concurrently. Fiber levels as low as 50,000 fibers/liter were optically detectable. The method offers a fast and inexpensive means for measuring, either on a continuous basis or as discrete samples, the fiber levels of filtration plant output. Further calibration of the instrument could enable analysis for other specific particulate contaminants as well. DOE

NONIDEAL COMPENSATION IN MHD GENERATORS Ph.D. Thesis
David A. Carl 1979 274 p
Avail: Univ. Microfilms Order No. 8009457

Nonideal compensation, the distortion of the total magnetic flux density by the induced magnetic flux density despite the presence of compensating bus bars, was examined with one and two dimensional models. The conducting fluid was assumed to be an incompressible liquid at a constant velocity. The iterative solution technique used in both models consisted of iterating between an equivalent circuit model that solves for the air gap current distribution, given the total magnetic flux density distribution, and a magnetic field model that solves for the total magnetic flux density distribution, given the air gap current distribution. End loss was modeled by a shunt resistance. The one dimensional model was intended to indicate general trends. The two dimensional model was intended to provide a more detailed analysis. Dissert. Abstr.

COLLISIONAL EFFECTS ON ELECTROSTATIC WAVES IN ISOTROPIC PLASMAS Ph.D. Thesis
Ronald Wilensky 1979 183 p
Avail: Univ. Microfilms Order No. 8006369

The effect of electron neutral collisions on electrostatic wave propagation in an isotropic Lorentz plasma was investigated. The linearized Boltzmann equation was solved assuming the neutrals are stationary and infinitely heavy. Electron-neutral scattering is described by an arbitrary scattering cross section. For a small sinusoidal perturbation of the plasma, the resultant electron velocity distribution is the sum of an arbitrary isotropic distribution plus an incremental function represented by an infinite continued fraction containing all the Allis transport collision frequencies. From this distribution, a dispersion relation for electrostatic wave propagation was derived. Solutions of this relation are found for

three representative collision processes (constant mean free path, constant mean free time, and Ramsauer scattering) for both Maxwellian and nonMaxwellian equilibrium electron velocity distributions.

DIVERTOR EXPERIMENTS IN A TOROIDAL PLASMA, WITH ExB DRIFT DUE TO AN APPLIED RADIAL ELECTRIC FIELD Ph.D. Thesis
Edward Jonathan Strait 1979 244 p
Avail: Univ. Microfilms Order No. 8004746

The ExB drift arising from an externally applied electric field was examined for application in a Tokamak or other toroidal magnetic plasma confinement device to remove plasma and impurities from the region near the wall and reduce the amount of plasma striking the wall. Among the possible advantages of this scheme are easy external control over the rate of removal of plasma, more rapid removal than the naturally occuring rate in a magnetic divertor, and simplification of construction if the magnetic divertor is eliminated. Results of several related experiments performed in a levitated octupole are presented. A model based on the plasma's perpendicular dielectric constant and perpendicular conductivity is described which suggests that such an electric field applied perpendicular to the magnetic field will be inversely proportional to plasma density, allowing the electric field to penetrate the plasma on the scale length of the density profile. Dissert. Abstr.

STABILITY ANALYSIS OF CYLINDRICAL VLASOV EQUILIBRIA Ph.D. Thesis
Robert Wesley Short 1979 204 p
Avail: Univ. Microfilms Order No. 8001628

A method is presented for the stability analysis of cylindrically symmetric collisionless plasmas. The method is applied to any such plasma which is described by the Vlasov-Poisson or Vlasov-Maxwell equations. The plasma and field equations are linearized and Fourier analyzed in the ignorable coordinates theta and zeta. The coordinates of the particle trajectories in phase space are represented as Fourier series in time and the perturbed distribution function is obtained by integration over unperturbed orbits. The method is first presented for the Vlasov-Poisson equations, and demonstrated by a calculation of the lower hybrid drift instability in a plasma with a rigid rotor distribution function. The method is then extended to the fully electromagnetic case and applied to a relativistic E layer interacting with a warm background plasma. Dissert. Abstr.

N80-21153 Missouri Univ. - Columbia.
BACKSCATTERING OF ELECTROMAGNETIC WAVES FROM ELECTROSTATIC WAVES IN A MAGNETIZED PLASMA Ph.D. Thesis
Sinan Karin Bilikmen 1979 126 p
Avail: Univ. Microfilms Order No. 8007130

Stimulated backscattering which arises from the parametric decay of an intense electromagnetic wave into an electrostatic wave and a backscattered electromagnetic wave was investigated. The analysis was facilitated by derivation of a pair of coupled differential equations for the amplitudes of the backscattered and scatterer waves by using Maxwell's equations and two fluid equations for homogeneous, inhomogeneous, bounded and unbounded magnetized plasmas. The backscattering of an intense electromagnetic wave was examined, while propagating in the ordinary mode along a number density gradient and perpendicular to a uniform static magnetic field. The stimulated backscattering of electromagnetic waves from extraordinary waves propagating normal to a magnetic field in a plasma of finite length was also studied. Dissert. Abstr.

DEFLAGRATION WAVE FORMED BY ION BEAM. PART 3: WITH ENERGY OF DIRECT FUSION REACTION
Keishiro Niu, Takashi Abe, and Moritake Tamba Jan. 1980 15 p refs
(IPPJ-435-Pt-3) Avail: NTIS HC A02/MF A01

The structure of the deflagration wave which is formed in a target bombarded by an ion beam was analyzed. Stationary deflagration and/or detonation waves are formed at the surface of the target in a case in which the reaction energy of direct fusion and/or the beam energy deposited in the target are less than a critical value. On the other hand, no solution for stationary wave exists, if the energy deposited in the wave exceeds a critical value. In the latter case, the time-dependent fundamental equations reduce approximately to a self-similar type of equations. Numerical integrations are carried out for this type of differential equations, and an example of self-similar deflagration wave numerically obtained is plotted in the figures. A.R.H.

NUMERICAL STUDY OF CURRENT-DRIVEN COLLISIONAL DRIFT AND ALFVEN INSTABILITIES IN A SHEARED MAGNETIC FIELD
Ken-ichi Nishikana Jan. 1980 34 p refs
(IPPJ-436) Avail: NTIS HC A03/MF A01

A set of coupled eigenmode equations for drift and shear Alfven mode in a sheared magnetic field is solved numerically including effects of parallel current, the full ion dynamics and electron-ion collisions. Detailed studies are made on the eigenmode structures of both the modes and combined effects of current and finite-beta. An outstanding result is that the current-driven drift mode shows, at some moderate beta value, a peculiarity in dispersion and its eigenmode structure is deformed to a shape different from the usual one, which means the strong coupling of drift mode to shear Alfven mode due to the combined effects. In the most cases except this, the effects of finite-beta and collisions are found to be stabilizing. A.R.H.

N80-21158# Nagoya Univ. (Japan). Inst. of Plasma Physics.
HIGH POWER ION-IRRADIATION TEST FOR CTR FIRST WALL

(NASA Order W-14365)
(NASA-CR-162843; AD-A078231; AD-E000340; NRL-MR-4127) Avail: NTIS HC A03/MF A01 CSCL 20/9

The stabilization of electron beam interactions due to strongly turbulent nonlinearities is studied analytically and numerically for a wide range of plasma parameters. A fluid mode coupling code is described in which the effects of electron and ion Landau damping and linear growth due to the energetic electron beam are included in a phenomenological manner. Stabilization of the instability is found to occur when the amplitudes of the unstable modes exceed the threshold of the oscillating two stream instability. The coordinate space structure of the turbulent spectrum which results clearly shows that soliton-like structures are formed by this process. Phenomenological models of both the initial stabilization and the asymptotic states are developed. Scaling laws between the beam-plasma growth rate and the fluctuations in the fields and plasma density are found in both cases, and shown to be in good agreement with the results of the simulation. TECHNIQUES FOR MEASURING THE ALPHA-PARTICLE DISTRIBUTION IN MAGNETICALLY CONFINED PLASMAS
D. E. Post, D. R. Mikkelsen, R. A. Hulse, L. D. Stewart, and J. C. Weisheit Oct. 1979 53 p refs
(Contract EY-76-C-02-3073)
(PPPL-1592) Avail: NTIS HC A04/MF A01

Methods are proposed for measuring the alpha particle distribution in magnetically confined fusion plasma using neutral atom doping beams, ultraviolet spectroscopy, and neutral particle detectors. In the first method, single charge exchange reactions are used to populate the n = 2 and n = 3 levels of He(+). The ultraviolet photons from the decaying excited states are Doppler shifted by 5 to 10 Angstroms from those produced by the thermalized alpha particle ash. In the second method double charge exchange reactions enable fast neutralized alpha particles to escape from the plasma and be detected by neutral particle analyzers. Detector configurations are analyzed, count rates are estimated, and their detectability is discussed. A preliminary analysis of the feasibility of the required neutral beams is presented, and exploratory experiments on esisting devices are suggested. DOE

VELOCITY SPACE INSTABILITIES OF ALPHA PARTICLES IN TOKAMAK REACTORS
D. J. Sigmar 1979 16 p refs Presented at Course and Workshop on Phys. of Plasmas near Thermonucl. Conditions, Varenna, Italy, 27 Aug. - 7 Sep. 1979
(Contract W-7405-eng-26)

(DOE/TIC-11016) Avail: NTIS HC A02/MF A01

The conditions for the linear theory and the anomalous relaxation of the velocity space instability of isotropic alpha distribution functions are discussed. Mathematical models show that such distributions actually arise under thermonuclear conditions in a Tokamak reactor, particularly for the case of imperfect alpha particle confinement. The toroidal geometry of the problem is described and the derivations which display the linear instability of the compressional plasma waves are presented. A.W.H.

MATHEMATICAL MODELS OF SOME CONTROLLED CRYSTALLIZATION PROCESS
A. Gosiewski and M. Niezgodka. Oct. 1979. 19 p. refs. Transl. into ENGLISH from Arch. Automatyki Telemechaniki (Poland), v. 23, no. 3, 1978 p 255-265
(BLL-RTS-12032) Avail: British Library Lending Div., Boston Spa, Engl.

The process of controlled crystal growth from a binary melt is examined. A mathematical model of this process is formulated in the form of a system of two phase parabolic boundary problems with free interface relating to the temperature and concentration fields. The boundary conditions are used as process control variables. An integral equivalent representation of the model is presented. A control problem whose objective is to achieve the desired dynamic properties of the phase change interface and to attain a fixed terminal state is described. A.W.H.

LOAD RELAXATION AND TRANSMISSION ELECTRON MICROSCOPY STUDIES OF GERMANIUM Ph.D. Thesis
Shin-Wu Chiang. 1979. 165 p.
Avail: Univ. Microfilms. Order No. 8003907

The log sigma - log xi data obtained from load relaxation experiments on Ge single crystals are analyzed using a rheological model. A systematic transition from concave upward to concave downward curvature occurs with increasing temperature, corresponding to a transition from glide controlled to climb/cross-slip controlled deformation. Also faulted dipoles ranging in height from 3 to 12 nm in deformed weak beam transmission electron microscopy techniques. Only intrinsic, Z-shape faulted dipoles are observed. Lattice fringe images of large faulted dipoles yield stacking fault energy of 78 + or - 7 sq/mJm. As determined from the height and width of faulted dipoles viewed end-on in lattice fringe images, the value for the stacking fault calculated from anisotropic elasticity theory increases from 78 to 160 sq/mJm as the height decreases from 5 to 3 nm.

EFFECTS OF SURFACE STRUCTURE ON SECONDARY ELECTRON EMISSION Ph.D. Thesis
Marten Leendert DenBoer. 1979. 72 p.
Avail: Univ. Microfilms. Order No. 8006757

The strong indications of low energy electrons with most materials has led to their widespread use as a probe of the surface region. Perhaps the simplest experiment utilizing electrons is to measure the total secondary yield as a function on incident electron energy. Although such a plot appears smooth, there are many small, but relatively abrupt inflections that can be enhanced by differentation with respect to incident electron energy. In particular, sudden increases in yield are associated with the thresholds for the excitation of core states, i.e., the so-called appearance potentials. To clarify the mechanism for this effect, the energy distribution of electrons contributing to these features was analyzed. It is found that at threshold, while the elastic yield decreases due to the opening of a new inelastic channel, the total yield in general increases because of the inelastic scattering of electrons from Auger recombination of the created core holes. This produces a shower of low energy electrons which are responsible for most of the increase in yield.

STUDY OF RAMAN LINEWIDTHS AS A FUNCTION OF STRUCTURE, BONDING AND TEMPERATURE Ph.D. Thesis
Regis Joseph Betsch. 1979. 174 p.
Avail: Univ. Microfilms. Order No. 8005977

The anomalous Raman line broadening in crystalline materials was studied. To differentiate between the various sources of line broadening, an empirical model of the Raman scattering process was developed. The digitized Raman spectra were analyzed using smoothing and curve fitting routines developed on an IBM 370/168 computer. The capabilities of the automated system and the analysis software were examined using the Raman spectrum of diamond. The materials studied which exhibit anomalous linewidth behavior were: LaB6, rutile (TiO2), and sillenite (Bi12GeO20).

STUDIES IN THE ELECTRONIC STRUCTURE OF MATTER Ph.D. Thesis
C. A. Swarts. 1979. 350 p. refs.
(Contract EY-76-C-02-1198)
(COO-1198-1268) Avail: NTIS HC A15/MF A01

The results of various theories for the angular distribution of electrons photoemitted from the outermost p shell of rare gas atoms are compared. The theories compared are the local density theories of Slater and of Hohenberg, Kohn and Sham, the pseudopotential method, Hartree-Fock theory, and random phase approximation with exchange. Extended Huekel theory is applied to GaAs, GaP, and to the nitrogen isoelectronic trap in GaAs and GaP. The computer perfect crystal band structures are found to be in reasonable agreement with those computed with empirical pseudopotentials. Nitrogen impurity levels in GaAs and GaP are calculated using a cluster model. By means of model calculations for an independent electron metal, exact lineshapes are obtained for the photon absorption, emission and photoemission spectra of deep core states.

MOLECULAR BEAM PHOTOIONIZATION AND GAS-SURFACE SCATTERING Ph.D. Thesis
S. T. Ceyer Sep. 1979 244 p refs
(Contract W-7405-eng-48)
(LBL-9838) Avail: NTIS HC A11/MF A01

The energetics of the ethylene ion-molecule reactions was investigated. The energetics of the solvated ethlyene dimer ion was investigated by the photoionization of the ethylene trimer. The absolute proton affinity of NH3 and the proton solvation energies by more than one NH3 were determined by molecular beam photoionization. In addition, the NH3(+) - NH3 interaction energy was measured by photoionization of the neutral van der Waals dimer. The scattering of helium atomic beams from a high Miller index platinum surface that exhibits ordered, periodic steps on the atomic scale to probe the effect of atomic steps on the scattering distribution is explored. The design, construction and operation of a beam surface scattering apparatus are described. DOE

MEASUREMENTS AND CALCULATIONS OF ELECTRONIC EXCITATION FROM COLLISIONS BETWEEN ATOMS OF ALKALIS AND MERCURY IN THE ENERGY RANGE 10 eV TO 1400 eV [MESSUNG UND BERECHUNG INTEGRALER ELEKTRONISCHER ANREGUNGSQUERSCHNITTE FUER ALKALI-QUECKSILBER-STOSSSYSTEME IM ENERGIEBEREICH ZWISCHEN 10 UND 1400 eV]
Gebhard Moritz Nov. 1978 151 p refs In GERMAN
(MPIS-24/1978) Avail: NTIS HC A08/MF A01; Max-Planck Inst. fuer Stroemungsforsch., Goettingen, West Germany DM 27.15

Exchanges between the alkali metals Na, K, Cs, Rb, and Hg were studied by measuring the radiation emitted in a dispersion chamber when the alkali beam interacts with the mercury atoms. Spectrum analysis and intensity measurements show that the dominant factor is the scattering of the lowest resonance level of the alkali. Application of quantum mechanics (with the solution of the Schroedinger equations) gave exact solutions in the low energy domain. Author (ESA)

(PB80-110364; NBS-MONO-25-SECT-16; LC-53-61386) Avail: NTIS HC A09/MF A01 CSCL 20B

Standard X-ray diffraction patterns are presented for 86 substances. Fifty-eight of these patterns represent experimental data and 28 are calculated. The experimental X-ray powder diffraction patterns were obtained with an X-ray diffractometer. All of values were assigned Miller indices determined by comparison with computed interplanar spacings consistent with space group extinctions. The densities and lattice constants were calculated and the refractive indices were measured whenever possible. The calculated X-ray powder diffraction patterns were computed from published crystal structure data. Both peak height and integrated intensities are reported for the calculated patterns. GRA

ACCELERATING PARTICLES IN GENERAL RELATIVITY (STATIONARY C-METRIC) Ph.D. Thesis
Hamid Farhoosh 1979 133 p
Avail: Univ. Microfilms Order No. 8005762

The physical and geometrical properties of uniformly accelerating particles in the general theory of relativity are examined. The structure of the Killing horizons in the static vacuum C-metric which represents the gravitational field of a uniformly accelerating Schwarzschild like particle (nonrotating and spherically symmetric) is studied. It is shown that for $A(2)m(2) < 1/27$ there exist two physically meaningful Killing horizons. The results are generalized to include the effects of the rotation of the source. For small acceleration and small rotation, the solution reveals the existence of three Killing horizons. The radial geodesic and nongeodesic motions in the static vacuum C-metric (nonrotating case) are also investigated. Finally, the radiative behavior of the stationary charged C-metric representing the electrogravitational field of uniformly accelerating and rotating charged particle with magnetic monopole and the NUT-parameter are investigated. Dissert. Abstr.

The report describes an RADC sponsored R D effort directed at providing an improved natural language access to differently formatted target databases. Section I defines functional characteristics of on-line intelligence information systems within the current state-of-the-art; describes the rationale of the AQT effort, and provides a comparison between the AQT approach and other approaches inherent in the existing information systems with a practical orientation. Section 2 describes basic concepts of the AQT approach (extended relational data models, intermediate query language, table driven translation). Linguistic implementation of natural language query techniques is provided in Section 3. Section 4 deals with the methodology of accessing differently formatted target databases. Section 5 describes some special problems in querying target databases (e.g., generic keys, ellipsis, purging a context, conversational postulates). Section 6 constitutes a detailed description of the presently available AQT testbed system. Section 7 provides criteria for evaluation of user interface languages for database management systems. Section 8 is a statement of conclusions including present status and results; operational evaluation criteria; areas for further work, plans, summary and directions. GRA

Two problems concerning noiseless source coding with side information are considered. It is shown that not only is the maximum reliable transmission rate unaffected by whether or not the encoder has access to the side information, but also the block error probability is essentially unaffected and that, in a sense, all the encoder need know about the source is the alphabet size. The second problem considered is that where neither the encoder nor decoder knows the side information and good performance, in some sense, is required for all values of side information (i.e., universal coding). It is shown that the minmax redundancy and the maxmim redundancy, are essentially the same for variable length codes. Finally, a similar minmax, maxmim equivalence for error probability with block codes is established. GRA

83 ECONOMICS AND COST ANALYSIS

Includes cost effectiveness studies.

MARKETING AND MARKET ACCEPTANCE DATA FROM THE RESIDENTIAL SOLAR DEMONSTRATION PROGRAM. VOLUME 1: DETAILED ANALYSIS, AUTUMN 1979
1979 218 p refs Sponsored in part by HUD
(PB80-115298; HUD-0050579) Avail: NTIS HC A10/MF A01 CSCL 05C

The marketing and market acceptance components of HUD's residential solar heating and cooling demonstration program, designed to promote the development of a self-sustaining solar energy industry, are analyzed. The actual experiences of actors and institutions involved in the market acceptance of solar houses are described. Emerging trends in the characteristics, opinions, and actions of participants in the demonstration program are identified and explored. All findings are based on marketing interviews with program participants, with a market acceptance model used to guide analysis. Practical information relevant to the construction industry and solar manufacturers is emphasized. GRA

GEOTHERMAL ENERGY MARKET PENETRATION: DEVELOPMENT OF A MODEL FOR THE RESIDENTIAL SECTION
Allen C. Goodman Sep. 1979 34 p refs
(Contracts EX-76-A-36-1008; DE-AI01-79ET-27025)
(PB80-118359; APL/JHU-QM-79-209; APL/JHU-GEMS-006; MCGER-79/003) Avail: NTIS HC A03/MF A01 CSCL 05C

A model was developed that examines the feasibility of using geothermal technology in heating residential structures. Specific account is taken of the small contribution of new housing to the total stock in any given year and of the durability of houses and their furnaces. Both aspects constrain the penetration of geothermal energy into the residential market. Other market penetration paradigms are discussed and a simple model of market penetration is presented that is based on the premise that homeowners will not abandon an existing furnace until its economic life is over. Behavioral parameters are considered and the model is extended from 20 to 40 years. Methods are discussed for collecting the needed data to determine market penetration, and ideas are proposed of ways to induce homeowners to give up economically viable furnaces to allow the firm providing the energy to reduce costs. GRA

FUEL ECONOMY SCREENING STUDY OF ADVANCED AUTOMOTIVE GAS TURBINE ENGINES
John L. Klann Mar. 1980 57 p
(Contract EC-77-A-31-1040)
(NASA-TM-81433; E-357; DOE/NASA/1040-80/11) Avail: NTIS HC A04/MF A01 CSCL 13F

Fuel economy potentials were calculated and compared among ten turbomachinery configurations. All gas turbine engines were evaluated with a continuously variable transmission in a 1978 compact car. A reference fuel economy was calculated for the car with its conventional spark ignition piston engine and three speed automatic transmission. Two promising engine/transmission combinations, using gasoline, had 55 to 60 percent gains over the reference fuel economy. Fuel economy sensitivities to engine design parameter changes were also calculated for these two combinations. Author

ERROR ANALYSIS IN THE MEASUREMENT OF AVERAGE POWER WITH APPLICATION TO SWITCHING CONTROLLERS Contractor Report, Oct. 1978 - Oct. 1979
James E. Maisel Mar. 1980 84 p refs Sponsored by NASA
(Contract EC-77-A-31-1044)
(NASA-CR-159792; DOE/NASA/3222-80/1) Avail: NTIS HC A05/MF A01 CSCL 10B

Power measurement errors due to the bandwidth of a power meter and the sampling of the input voltage and current of a power meter were investigated assuming sinusoidal excitation and periodic signals generated by a model of a simple chopper system. Errors incurred in measuring power using a microcomputer with limited data storage were also considered. The behavior of the power measurement error due to the frequency responses

of first order transfer functions between the input sinusoidal voltage, input sinusoidal current, and the signal multiplier was studied. Results indicate that this power measurement error can be minimized if the frequency responses of the first order transfer functions are identical. The power error analysis was extended to include the power measurement error for a model of a simple chopper system with a power source and an ideal shunt motor acting as an electrical load for the chopper. The behavior of the power measurement error was determined as a function of the chopper's duty cycle and back EMF of the shunt motor. Results indicate that the error is large when the duty cycle or back EMF is small. Theoretical and experimental results indicate that the power measurement error due to sampling of sinusoidal voltages and currents becomes excessively large when the number of observation periods approaches one-half the size of the microcomputer data memory allocated to the storage of either the input sinusoidal voltage or current. A headway sensing system for an automated mixed traffic vehicle (AMTV) employing an array of optical proximity sensor elements is described, and its performance is presented in terms of object detection profiles. The problem of sensing in turns is explored experimentally and requirements for future turn sensors are discussed. A recommended headway sensor configuration, employing multiple source elements in the focal plane of one lens operating together with a similar detector unit, is described. Alternative concepts including laser radar, ultrasonic sensing, imaging techniques, and radar are compared to the present proximity sensor approach. Design concepts for an AMTV body which will minimize the probability of injury to pedestrians or passengers in the event of a collision are presented. K.L.

URBAN MASS TRANSPORTATION ENERGY CONSERVATION: SRGP OPERATING INSTRUCTIONS AND PROGRAM DOCUMENTATION, VOLUME 5 Final Report
J. F. MacMann and R. E. Nestle. Oct. 1979. 120 p. refs.
(Contract EM-76-C-01-8628)
(DOE/PE/8628-1-Vol-5) Avail: NTIS HC A06/MF A01

A computer program for Short Range Generalized transportation Policy (SRGP) analysis developed for use in analyzing the energy conservation potential of a broad spectrum of transit, carpooling, vanpooling, parking, pricing, and other transportation system management measures is described. It is intended for use in either an areawide or corridor context and in what is referred to as a sketch planning style of analysis. Output includes changes in fuel consumption, vehicle emissions, vehicle miles of travel, and modal shares for drive alone, shared ride, and transit. Changes in travel behavior are forecast relating to auto ownership, work trip mode choice, and the frequency, destination, and mode choice for both shopping and social/recreational nonwork travel. Using a random sample household forecasting procedure, SRGP is a modified version of the program UMODEL, distributed by the U.S. Urban Mass Transportation Administration as part of UTPS, the Urban Transportation Planning System. DOE

URBAN TRANSPORTATION ENERGY CONSERVATION: CASE CITY APPLICATIONS OF ANALYSIS METHODOLOGIES, VOLUME 3 Final Report, Jul. 1976 - Sep. 1978
T. J. Atherton and J. H. Suhrbier. Oct. 1979. 160 p. refs.
(Contract EM-76-C-01-8628)
(DOE/PE/8628-1-Vol-3) Avail: NTIS HC A08/MF A01

Disaggregate travel demand methodologies were applied to the analysis of potential energy conservation strategies in three urban areas: Denver, Colorado; Fort Worth, Texas; and San Francisco, California. The methodologies are sketch planning in nature and include the forecasting of changes in automobile ownership; work trip model shares by drive alone, shared ride, and transit; nonwork trip frequency, destination, and mode choice; fuel consumption and vehicle emissions. Policies analyzed include those related as employer based ride sharing, parking management, transit, pricing, and traffic operations. Considerable variations in the potential effectiveness was found, among the three urban areas, depending in large part on the availability of alternative travel modes such as transit. Descriptions are provided of the individual policy analyses performed, the methods by which example policies were analyzed, the necessary data preparation activities, and the procedures used to adapt the set of travel demand models to the unique conditions of each of the three metropolitan areas. DOE

N80-21207# Cambridge Systematics, Inc., Mass.
URBAN TRANSPORTATION ENERGY CONSERVATION: ANALYTIC PROCEDURES FOR ESTIMATING CHANGES IN TRAVEL DEMAND AND FUEL CONSUMPTION, VOLUME 2 Final Report, Jul. 1976 - Sep. 1978
T. J. Atherton and J. H. Suhrbier. Oct. 1979. 153 p. refs.
(Contract EM-76-C-01-8628)
(DOE/PE/8628-1-Vol-2) Avail: NTIS HC A08/MF A01

Analytical tools used to evaluate the effectiveness of alternative transportation policies in achieving reductions in overall fuel consumption are presented. To ensure a high measure of accuracy, the analysis goes beyond the first order effects, i.e., the shift from single occupant autos as the mode chosen for the work trip to more fuel efficient means of travel. Questions treated include what will happen with the autos left at home as a result of increased carpooling for work trips. The methodology developed links together several disaggregate travel demand models to predict auto ownership, work trip mode choice, and nonwork travel demands. The theoretical basis for the travel demand models used is introduced. These models and their linkages both with each other and with the various submodels are described. The assumptions made in developing the model system and using it to forecast responses to alternative transportation policies are included. Emphasis is placed on the conceptual framework of the model system and specification of the individual models and submodels. DOE

ANALYTICAL PROCEDURES FOR URBAN TRANSPORTATION ENERGY CONSERVATION: SUMMARY OF FINDINGS AND METHODOLOGIES, VOLUME 1 Final Report, Jul. 1976 - Apr. 1979
J. H. Suhrbier and W. D. Byrne. Oct. 1979. 54 p. refs. 5 Vol.
(Contract EC-76-C-01-8628)
(DOE/PE/8628-1-Vol-1) Avail: NTIS HC A04/MF A01

Analytical methodologies are described and illustrated for use in analyzing the energy conservation potential of candidate urban transportation measurements. Quantitative methodologies oriented to carpooling, vanpooling, transit, pricing, traffic regulation and control, and auto ownership are provided based on the use of disaggregate behavioral travel demand models. Changes are indicated in trip frequency and distribution as well as in travel model, operating conditions, and vehicle miles of travel. Trip-based estimates of fuel consumption and vehicle emissions are included. The methodologies employ manual sketch planning procedures, a programmable calculator, or a fully-calibrated computer program utilizing a random sample household enumeration forecasting technique. The developed methodologies were applied in cooperation with metropolitan planning organizations representing the Dallas-Fort Worth, San Francisco, and Denver urban areas. DOE

TEST AND EVALUATION REPORT OF THE ERDC HYBRID-ELECTRIC VAN (HEVAN)
G. J. Klose May 1979 67 p
(Contract EX-76-A-31-1011)
(DOE/TIC-10232) Avail: NTIS HC A04/MF A01

The HEVAN or Hybrid-Electric Van is a battery powered electric vehicle with an on board gasoline fueled electric power generation unit. The HEVAN was developed from a Volkswagen transporter chassis. It is propelled by a series wound dc traction motor rated at 20 HP (14.9 kW) which is powered by sixteen 6-volt SGL lead acid batteries of nominally 96 volts. The motor power is controlled by an SCR chopper with a bypass contractor and drives the vehicle through a four-speed VW transaxle. The conventional VW hydraulic brake system is used; there is no provision for regenerative braking. The on board electric power generator consists of a 16-HP (11.9kW) gasoline engine driving a 7.5 kW alternator with a dc rectifier; this provides electrical power either directly to the drive motor or to the battery pack, depending on the battery charge state and the motor power requirements. Numerous tests were conducted with pure electric operation, but only limited results were obtained in the hybrid mode due to continual problems with the motor generator set. DOE

ENERGY STORAGE SYSTEMS FOR AUTOMOBILE PROPULSION
L. G. OConnell 26 Nov. 1979 35 p
(Contract W-7405-eng-48)
(UCID-18320) Avail: NTIS HC A03/MF A01

Energy storage power systems that are credible alternatives to the internal combustion engine system are evaluated. It is concluded that automotive electrical power systems can be developed for various performance levels. Most electricity using vehicles will weigh more and cost more than their internal combustion engine equivalents. If performance of these vehicles is reduced, they can be more cost competitive. Mechanical energy storage propulsion systems appear useful as power boosters for certain mission applications. DOE

INNOVATIONS AND TECHNOLOGY TRANSFER. THE ROLE OF THE EUROPEAN SPACE AGENCY, VOLUME 1 Final Report [INNOVATIONS ET TRANSFERTS TECHNOLOGIQUES: LE ROLE DE L'AGENCE SPATIALE EUROPEENE]
Patrice Brendle, Patrick Cohendet, Regis LaruedeTournemine, Helwig Schmied, and Daniel Vitray Feb. 1979 79 p In FRENCH 2 Vol.
(Contract ESA-3669/77-F-DKR(SC))
(ESA-CR(P)-1219-Vol-1) Avail: NTIS HC A05/MF A01

The areas of the economy most receptive to technology transfer, or which are most likely to readily absorb technological innovations were identified. Industrial opinion was solicited concerning the promotion of technical innovations resulting from activities in the European Space Agency (ESA). The sectors where most technology transfer occurs are telecommunications, optics, solar energy, and data processing. The monetary value of the ESA contribution has been determined for various technical sectors. In the view of industry, ESA has a role to play in both fundamental research, and in reducing costs of development. The patent system must be ameliorized within the member states to meet competition in external markets. Author (ESA)

URBANIZATION AND WATER QUALITY PLANNING: THE 208 EXPERIENCE IN MASSACHUSETTS
Harry E. Schwarz, Brandon B. Johnson, Robert J. Caiazzo, and Debra E. Pincus Jan. 1979 146 p refs Prepared in cooperation with Clark Univ., Worcester, Mass.
(Contract DI-14-34-0001-8023)
(PB80-106743; W80-00870; Pub-104; OWRT-A-104-Mass(1)) Avail: NTIS HC A07/MF A01 CSCL 13B

The degree of urbanization in an area that would affect the scope of the planning process, public participation in planning, and the plan itself was examined. Three measures of urbanization were used: the percentage of the region in urban land use; the proportion of the population served by sewers; and the population density. Each of these was an independent variable in assessing the interregional variation of attributes of the plans and of the planning process. It was found that the degree of urbanization does not appear to have been a significant factor in the 208 planning process. GRA

EVALUATION OF DEWATERING DEVICES FOR PRODUCING HIGH-SOLIDS SLUDGE CAKE
Alan F. Cassel and Berinda P. Johnson Aug. 1979 192 p
(Contract EPA-68-03-2455)
(PB80-111503; EPA-600/2-79-123) Avail: NTIS HC A09/MF A01 CSCL 13B

Pilot plant dewatering tests were made to establish design and operating parameters for dewatering municipal waste water sludges on recessed plate filter presses, continuous belt presses, and retrofit units for a vacuum filter. Results from the 1.5 year study showed that when dewatering lime and ferric chloride-conditioned sludges, the recessed plate presses consistently produced a 30 to 40 percent solids filter cake. Belt presses produced cake solids from 25 to 30 percent when the polymer conditioning dosage was optimized. When used as a retrofit device to a vacuum filter, the belt press gave cake solids in the 30 to 40 percent range. Design parameters are developed to dewater a mixture of 67 percent secondary and 33 percent primary sludge in a full scale plant installation. GRA

(Grant EPA-S-801398)
(PB80-105166; EPA-600/2-79-184) Avail: NTIS
HC A08/MF A01 CSCL 13B

The quality of water produced by each step of a state-of-the-art, commercially available process sequence and the feasibility and economics of renovating organic chemical wastewater for reuse as boiler feedwater or cycle cooling water were demonstrated using a 5-gpm pilot facility, located in Puerto Rico. The sequence consisted of sedimentation/filtration, carbon adsorption, pressure filtration, reverse osmosis, and ion-exchange. A pilot-scale boiler tested the product water as boiler feedwater at pressures, temperatures, and heat fluxes typical of full-scale manufacturing facilities. The cooling water test-loop studies indicated that special metallurgy would be required for the use of this renovated wastewater for cooling water. The total annualized cost of wastewater renovation to boiler feedwater quality at 67 percent water recovery, not including the cost of sludge or brine disposal, was $7.50/1000 gallons of product water in 1978. OZONE AND ULTRAVIOLET RADIATION DISINFECTION FOR SMALL COMMUNITY WATER SYSTEMS Final Report
Linden G. Witherell, Ray L. Solomon, and Kenneth M. Stone Jul. 1979 49 p refs
(Contract EPA-68-03-2182)
(PB80-108418; EPA-600/2-79-060) Avail: NTIS
HC A03/MF A01 CSCL 13B

Ozone and ultraviolet radiation were used as alternatives to chlorine for disinfection in several small existing community water systems. Both ozone and ultraviolet light were found to be inferior to chlorination from the standpoint of operation and maintenance requirements and maintaining disinfection in the distribution system. A disinfectant residual was found to be necessary even in the small water distribution systems studied. Neither ozone or ultraviolet provide a residual disinfectant. The main problem with chlorination in small community water systems is inadequate operation and maintenance. Inadequate operation and maintenance is a general problem of small community water systems, not limited to the disinfection aspect. GRA

The thickening and dewatering characteristics of chemical primary sludges were studied. Alum primary and ferric primary sludges were produced in parallel trains of a pilot operated using a municipal wastewater. Gravity thickening was evaluated using continuous, pilot scale gravity thickeners; dissolved air flotation thickening evaluations were performed using batch, bench-scale equipment. Sludge dewatering evaluations were performed for all chemical primary sludges using a pilot scale bowl centrifuge, vacuum belt filter and filter press. Correlations developed relating performance of each unit operation to specific characteristics identified for each chemical primary sludge are presented. An economic analysis of centrifugation and vacuum belt filtration of each chemical primary sludge is also presented. GRA

IMAGE PROPERTIES OF AN X-RAY TELESCOPE OF THE WOLTER-1 TYPE WITH EMPHASIS ON CONTRAST REDUCTION BY DIFFUSE REFLECTION Ph.D. Thesis
R. Lenzen Jan. 1980 105 p refs Transl. into ENGLISH of "Abbildungseigenschaften eines Roentgenteleskops vom Type Wolter-1 unter Besonderer beruecksichtigung der Kontrastverminderung Durch Diffuse Reflexion", West Germany, 1978 p 1-123 Original language document announced as A79-41829 Transl. by Scientific Translation Service, Santa Barbara, Calif.
(Contract NASw-3198)
(NASA-TM-75805) Avail: NTIS HC A06/MF A01 CSCL 03A

Theoretical and experimental results are presented on the geometrical-optic imaging properties of a Wolter-1 type paraboloid-hyperboloid X-ray telescope. Particular consideration is given to the effect of microroughness of the mirror on the imaging properties. Experiments were conducted in which scattering properties were determined as a function of wavelength, incidence angle, and roughness of the plane mirrors. Results indicate the need for optimization of mirror material and polishing technology as well as the development of improved mirror manufacturing techniques. The use of transmission gratings along with the Wolter-1 type telescope in spectroscopy applications is discussed. Author

SUPERCONDUCTING MAGNET SYSTEM FOR THE SPIRIT COSMIC RAY SPACE TELESCOPE
M. A. Green, J. M. DeOlivares, G. Tarle, P. B. Price, and E. K. Shirk Aug. 1979 18 p refs Presented at the Cryog. Eng. Conf., Madison, Wis., 21 Aug. 1979
(Contract W-7405-eng-48)
(LBL-9699; CONF-790815-32) Avail: NTIS HC A02/MF A01

The SPIRIT (a superconducting passive iron isotope telescope) experiment which requires a large volume of 2T field in order to achieve enough resolution to study heavy primary cosmic rays is discussed. It is proposed that the SPIRIT superconducting magnet system and its experimental package would be used in one of the space shuttles. The superconducting magnet design, based on thin high current density solenoid technology, is described. The superconducting magnet system consists of a number of coils which generate a 2T induction within the experiment, and at the same time allow free access to the package by cosmic rays. The superconducting magnet system uses a high current density conductor which is protected by a shorted secondary circuit. The magnet coils are to be cooled by pumped two phase helium which is circulated through tubes. Refrigeration is supplied from a large liquid helium dewar. DOE

90 ASTROPHYSICS

Includes cosmology; and interstellar and interplanetary gases and dust.

N80-21226 Johns Hopkins Univ., Baltimore, Md.
INTERSTELLAR MATTER AND EXTRAGALACTIC LIGHT Ph.D. Thesis
Rodney Charles Anderson 1979 246 p
Avail: Univ. Microfilms Order No. 8006911

Analyses of two experimental programs designed to estimate the density of the universe are reported. First, the Copernicus satellite was used to observe hydrogen and deuterium absorption in local interstellar matter. Secondly, two far ultraviolet spectrometers were used to study galactic plane light scattered off interstellar dust, in order to measure the scattering properties of the dust, and also to detect cosmic background radiation. The interstellar absorption spectra were obtained using bright, close stars as light sources. The density and temperature of interstellar hydrogen and deuterium along the line of sight to each target star were obtained by fitting appropriate models to the data. A set of acceptable densities and temperatures is presented for each star. Dissert. Abstr.

N80-21227 Cornell Univ., Ithaca, N. Y.
LATE-STAGE EVOLUTION OF SUPERNOVA REMNANTS Ph.D. Thesis
William Isaac Newman 1979 257 p
Avail: Univ. Microfilms Order No. 8003969

The evolution of spherically symmetric supernova remnants is examined by analytic and numerical means. The blast is assumed to take place in an homogeneous interstellar medium with a uniform density and an initially constant total energy. An approximate representation of the radiative cooling is included, precipitating a thermal instability and producing a cold dense shell. The dynamical transition from adiabatic to radiation dominated behavior is numerically simulated by a modified form of the pseudo viscosity method. Dissert. Abstr.

N80-21228 City Univ. of New York, N. Y.
THE HIGH LATITUDE EXTENSIONS OF GALACTIC SPIRAL ARMS Ph.D. Thesis
Judith Ellen Soukup 1979 202 p
Avail: Univ. Microfilms Order No. 8006747

The high z extensions of spiral arms in our galaxy were investigated observationally and theoretically. Numerical calculations of interstellar gas flow in a tightly wound spiral density wave were performed. The equations were time dependent; the two spatial dimensions were along the streamlines in the galactic plane and perpendicular to the plane. The analog between one dimensional gas flows into a potential hill and into a converging diverging nozzle is discussed to show exactly why and where a shock forms in a spiral arm. Two thermodynamic models of the gas are considered: an isothermal gas and a gas whose temperature increases with height from the galactic plane. Dissert. Abstr.

N80-21229 Wisconsin Univ. - Madison.
THE STRUCTURE AND DYNAMICS OF H2 REGIONS Ph.D. Thesis
Gary Lee Welter 1979 80 p
Avail: Univ. Microfilms Order No. 8001642

The early evolution of H2 regions, through the first few 100,000 years, is investigated under conditions of enhanced central density and increasing cluster luminosity. It is found that a D type ionization front can overtake the precursor shock under conditions of a fairly steep density-gradient such as may exist just beyond a stellar dust cocoon, or as new stars turn on within the H2 region. The shock is converted into a strong, outward moving pressure pulse as it is ionized. Rayleigh-Taylor instability in the shocked layer occurs as the ionization front approaches the shock, but the neutral globules so produced have a comparatively small and short term effect on nebular dynamics. The evolutionary effects of different recombination rates within the ionization front and different cooling rates within the shocked layer are investigated and found to be small. Possible modifica-

tions which the presence of dust or stellar winds could produce are briefly considered. Dissert. Abstr.

91 LUNAR AND PLANETARY EXPLORATION

Includes planetology; and manned and unmanned flights.

For spacecraft design see *18 Spacecraft Design Testing, and Performance*. For space stations see *15 Launch Vehicles and Space Vehicles*.

N80-21230 Pennsylvania State Univ., University Park.
AN INVESTIGATION AND ANALYSIS OF THE DENSITY AND THERMAL BALANCE OF THE MARTIAN IONOSPHERE Ph.D. Thesis
Ronald Perry Rohrbaugh 1979 176 p
Avail: Univ. Microfilms Order No. 8006049

The density and thermal balance of the Martian ionosphere were investigated and compared with the observational data from Vikings 1 and 2. The effects of diffusion and thermal conduction perpendicular to the assumed magnetic fields were included. An analysis of the thermalization of energetic O2(+) produced by the major ion neutral reactions was developed and presented. Dissert. Abstr.

N80-21231 Florida State Univ., Gainesville.
ON THE PRODUCTION OF LONG-PERIOD COMETS BY STELLAR PERTURBATIONS OF THE OORT COMET CLOUDS Ph.D. Thesis
Barbara Schreur 1979 118 p
Avail: Univ. Microfilms Order No. 8007506

A model cloud surrounding the Sun is established, and the perturbation to the orbits of the comets in this cloud as a result of the action of passing stars are presented. The model cloud of comets consists of some 100,000 comets with orbital orientations selected at random, and perihelion and aphelion distances selected to give a reasonable concentration of the space densities of the comets toward the Sun. A distribution of 100 passing stars was chosen to be representative of the probability of a given type of star passing at a given distance from the Sun. A perturbation of each cometary orbit due to each passing star was calculated. The individual perturbations were calculated as impuluses to be applied instantaneously to the orbit of a comet. As a check on the accuracy of this method, a number of perturbations were calculated by numerically integrating the equations of motion. The impulse method was found to be sufficiently accurate to determine the changes in the distribution of orbital parameters. Dissert. Abstr.

N80-21232 Cornell Univ., Ithaca, N. Y.
GEOMORPHOLOGY OF MARTIAN VALLEYS Ph.D. Thesis
David Christopher Pieri 1979 293 p
Avail: Univ. Microfilms Order No. 8003975

A broad range of topics related to Martian valleys are discussed including: terminology, classification, distribution, morphology, age, quantitative analysis of pattern, physics of flow, origin, and the relation of Martian valleys to climatic change. Channels are distinguished from valleys on the basis of: (1) the greater size of the large channels; and (2) the presence of flow erosions morphology in channels. Valleys generally are small (less than 5 km wide, less than 1 km deep), show little direct evidence of erosion by flow, and form ramified networks which coalesce down regional slopes. Data on morphology and planimetric characteristics of 240 Martian valley networks are presented. Dissert. Abstr.

N80-21233 California Univ., Los Angeles.
IMPACT CRATERS FROM CENTIMETERS TO MEGAMETERS Ph.D. Thesis
Steven Kent Croft 1979 282 p
Avail: Univ. Microfilms Order No. 8007428

The physics of cratering is related to the geology of craters by interpretation of empirical morphometrical relations determined for observed craters in terms of physical mechanisms known to be operative in cratering. A crater modification model is presented which quantitatively reproduces interior and ejecta volumes, rim heights and widths, apparent depths, and floor diameters of complex lunar craters. Diameter measurements are presented for central peak, peak ring, and multiring basins on the Moon, Mercury, Mars and the Earth. Rings of basins on all four planets are assigned to structural classes that are defined by morphological, morphometrical and geophysical criteria. Empirical relationships between structurally equivalent classes of rings are derived. Dissert. Abstr.

N80-21234*# Missouri Univ. -Rolla. Dept. of Chemistry.
TRANSPORT PROPERTIES IN THE ATMOSPHERE OF JUPITER Semiannual Progress Report, Jul. - Dec. 1979
Louis Biolsi, Jr. 1979 35 p refs
(Grant NsG-1369)
(NASA-CR-162897) Avail: NTIS HC A03/MF A01 CSCL 03B

The computer program used to obtain transport properties for the Hulburt-Hirschfelder potential was tested. Transport properties for the C-C interaction were calculated. Rough estimates for transport properties for the important ablation species were obtained as well as estimates of transport properties for some of the species associated with photochemical smog. The results are discussed. A.R.H.

N80-21235*# Atmospheric and Environmental Research, Inc., Cambridge, Mass.
OUTER SATELLITE ATMOSPHERES: THEIR EXTENDED NATURE AND PLANETARY INTERACTIONS Final Report, Feb. 1979 - Mar. 1980
William H. Smyth Apr. 1980 104 p refs
(Contract NASw-3174)
(NASA-CR-162902; FR-7) Avail: NTIS HC A06/MF A01 CSCL 03B

Highly developed numerical models are applied to interpret extended-atmosphere data for the sodium cloud of Io and the hydrogen torus of Titan. Solar radiation pressure was identified and verified by model calculations as the mechanism to explain two different east-west asymmetries observed in the sodium cloud. Analysis of sodium line profile data, suggesting that a Jupiter magnetospheric wind may be responsible for high speed sodium atoms emitted from Io, and preliminary modeling of the interaction of the Io plasma torus and Io's sodium cloud are also reported. Models presented for Titan's hydrogen torus are consistent both with the recent Pioneer 11 measurements and earlier Earth-orbiting observations by the Copernicus satellite. Progress is reported on developing models for extended gas and dust atmospheres of comets. Author

92 SOLAR PHYSICS

Includes solar activity, solar flares, solar radiation and sunspots.

N80-21236 Stanford Univ., Calif.
TO THE SOLAR FOCI Ph.D. Thesis
David Sonnabend 1979 324 p
Avail: Univ. Microfilms Order No. 8006356

The theory that the Sun is likely to act as a lens for gravitational radiation, with foci in the outer solar system is discussed. It is suggested that missions to these foci have the potential of directly measuring the density structure of the Sun. Other applications include gravitational wave astronomy and tests of general relativity. The theory is examined with emphasis upon the engineering aspects of focal missions - primarily spacecraft design and performance. Other topics studied include solar optics, gravitational wave detectors, navigation, and the design of missions for different purposes. Specifically, it will be shown that shuttle launched chemical rockets have a substantial capability for reacting some foci; and that all can be reached with large payloads using nuclear isotope - electric propulsion. Dissert. Abstr.

N80-21237*# Lockheed Missiles and Space Co., Palo Alto, Calif.

ANALYSIS OF TIME DEPENDENT PHENOMENA OBSERVED WITH THE LPSP OSO-8 INSTRUMENT Final Report
John W. Leibacher 15 Oct. 1979 170 p refs
(Contract NASw-3053)
(NASA-CR-162908) Avail: NTIS HC A08/MF A01 CSCL 03B

Data obtained by the Laboratoire de Physique Stellaire et Planetaire's ultraviolet spectrometer onboard the OSO-8 spacecraft were analyzed in an effort to dynamically model the solar chromosphere as an aid in enhancing knowledge of the dynamical processes themselves and of spectral line formation in the dynamic chromosphere. Repeated spectral scans of strong, optically thick resonance lines formed in the solar chromosphere were examined for indications of oscillatory velocities and intensities among other indications of velocity which were studied, the blue peak is reasonably well defined, and the position of a parabolic filter fitted by the least squares method was used to define it. Observed chromospheric oscillation periods are discussed as well as the variations in altitude of the emitting region which result primarily from the motion up and down during the oscillation. A.R.H.

DOPPLER OBSERVATIONS OF SOLAR ROTATION
P. H. Scherrer Mar. 1980 11 p refs Submitted for publication
(Contracts NAS5-24220; N00014-76-C-0207; Grants NGR-05-020-559; NSF ATM-77-20580)
(NASA-CR-162886; SU-SUIPR-804) Avail: NTIS HC A02/MF A01 CSCL 03B

Daily observations of the photospheric equatorial rotation rate using the Doppler effect mode at the Sanford Solar Observatory are presented. These observations show no variations in the rotation rate that exceed the observational error of about one percent. The average rotation rate is indistinguishable from that of sunspots and large scale magnetic field structures. J.M.S.

N80-21239*# Stanford Univ., Calif. Inst. for Plasma Research.
ON THE NATURE OF THE APPARENT RESPONSE OF VORTICITY AREA INDEX TO THE SOLAR MAGNETIC FIELD
J. M. Wilcox and P. H. Scherrer Mar. 1980 23 p refs
(Grant NGR-05-020-559; Contract N00014-76-C-0207; Grant NSF ATM-77-20580)
(NASA-CR-162915; SU-SUIPR-802) Avail: NTIS HC A02/MF A01 CSCL 03B

The characteristics of tropospheric circulation that are involved in the apparent response of the vorticity area index (VIA) as the solar magnetic field is carried past the Earth by the solar wind are discussed. It is shown that the response is concentrated in the tropospheric regions of most intense circulation, i.e. the central portions of well-formed low pressure troughs. Factors that must be considered when assessing the Sun-weather effect in the years from 1947 to 1978 are included. J.M.S.

N80-21240*# Stanford Univ., Calif. Inst. of Plasma Research.
THE ROTATION OF THE SUN: OBSERVATIONS AT STANFORD
J. M. Scherrer, J. M. Wilcox, and L. Svalgaard Feb. 1980 34 p refs
(Contract NAS5-24420; Grant NGR-05-020-559; Contract N00014-76-C-0207; Grant NSF ATM-77-20580)
(NASA-CR-162914; SU-SUIPR-799) Avail: NTIS HC A03/MF A01 CSCL 03B

Daily observations of the photospheric rotation rate using the Doppler effect made at the Stanford Solar Observatory since May 1976 are analyzed. Results show that these observations show no daily or long period variations in the rotation rate that exceed the observational error of about one percent. The average rotation rate is the same as that of the sunspot and the large-scale magnetic field structures. J.M.S.

93 SPACE RADIATION

Includes cosmic radiation and inner and outer earth's radiation belts.

For biological effects of radiation see *52 Aerospace Medicine*. For theory see *73 Nuclear and High-Energy Physics*.

EUROPEAN SCIENTIFIC NOTES, VOLUME 33, NUMBER 11
R. E. Machol, ed. and Dodie Thomas, ed. Nov. 1979 53 p
(AD A079711; ESN-33-11) Avail: NTIS HC A04/MF A01 CSCL 05/2

This is a monthly publication presenting brief articles concerning recent developments in European Scientific Research. It is hoped that these articles (which do not constitute part of the scientific literature) may prove of value to American scientists by calling attention to current developments and to institutions and individuals engaged in these scientific efforts. The articles are written primarily by members of the staff of ONRL and occasionally articles are prepared by, or in cooperation with, members of the scientific staff of the United States Air Force's European Office of Aerospace Research and Development and the United States Army Research and Standardization Group. Articles are also contributed by visiting Stateside scientists. GRA

SUBJECT INDEX

Typical Subject Index Listing

The subject heading is the key to the subject content of the document. Titles, report numbers, and accession numbers of pertinent documents are provided under each subject heading. When the title is insufficiently descriptive of the document content, a title extension has been added, separated from the title by three hyphens. The report number helps to indicate the type of document cited (e.g., NASA report, NASA translation, NASA contractor report). The NASA accession number is the number by which the document abstracts are arranged in this journal and by which the document is sold or requested. The titles, with title extensions if present, are arranged under each subject heading in ascending accession number order. The subject headings have been selected from the latest revision of the *NASA Thesaurus* (NASA SP-7050).

[PB80-102809] N80-20942

AIR TO AIR MISSILES
Aerothermal evaluation of high-temperature structural materials for use in high-performance missile design
[AD-A080023] N80-20319

AIR TRAFFIC CONTROL
Nowcast and short-range (0-2 hour) forecasts of thunderstorms and severe convective weather for use in air traffic control
[AD-A080426] N80-20247
Standard engineering installation package AN/TSQ-117, aircraft control central
[AD-A079776] N80-20254
Optimal flow control of air traffic
[PB80-105976] N80-20258

AIR TRANSPORTATION
The role of technology as air transportation faces the fuel situation
[NASA-TM-81793] N80-20260

AIR WATER INTERACTIONS
Laboratory study of thermal and flow structures in heated and/or cooled layers of water N80-20518
Monthly climatology for evaporation duct occurrence in the North Atlantic Ocean
[AD-A075524] N80-20992
Equatorial Pacific Ocean variability-seasonal and El Nino time scales N80-21007

AIRBORNE EQUIPMENT
Airborne electronic terrain map system: A literature review
[AD-A079402] N80-20255

AIRBORNE/SPACEBORNE COMPUTERS
Workshop on Real-Time Programming for NASA Flight Project
[NASA-TM-80236] N80-21045

AIRCRAFT ANTENNAS
A standardization evaluation potential study of the common multi-mode radar program
[AD-A079678] N80-20459

AIRCRAFT APPROACH SPACING
Optimal flow control of air traffic
[PB80-105976] N80-20258

AIRCRAFT CONFIGURATIONS
Aerodynamic design and analysis of the AST-204, AST-205, and AST-206 blended wing-fuse large supersonic transport configuration concepts
[NASA-CR-159223] N80-20232

AIRCRAFT CONSTRUCTION MATERIALS
Stress corrosion environmental effects on AF 1410 --- aircraft construction materials
[AD-A078598] N80-20374

AIRCRAFT CONTROL
Wing/store flutter with nonlinear pylon stiffness
[NASA-TM-81789] N80-20280
Adaptive estimation of information values in continuous decision making and control of advanced aircraft
[AD-A077917] N80-20281

AIRCRAFT DESIGN
Technology requirements and readiness for very large aircraft
[NASA-TM-81783] N80-20223
Aerodynamic design and analysis of the AST-204, AST-205, and AST-206 blended wing-fuse large supersonic transport configuration concepts
[NASA-CR-159223] N80-20232

AIRCRAFT ENGINES
Exhaust emissions characteristics for a general aviation light-aircraft Teledyne Continental Motors (TCM) GTSIO-520-K piston engine
[AD-A080433] N80-20270
A 150 and 300 kW lightweight diesel aircraft engine design study
[NASA-CR-3260] N80-20271
JT9D-7A (SP) jet engine performance deterioration trends
[NASA-TM-81459] N80-20274

AIRCRAFT EQUIPMENT
Development of a color alphanumeric liquid crystal display --- suitable for aircraft command and control
[AD-A079289] N80-20266

AIRCRAFT FUELS
The role of technology as air transportation faces the fuel situation
[NASA-TM-81793] N80-20260

AIRCRAFT GUIDANCE
Improved Sun-sensing guidance system for high-altitude aircraft
[NASA-CASE-FRC-11052-1] N80-20249

AIRCRAFT INSTRUMENTS
Airborne aids for coping with low-level wind shear. All-weather landing systems, engineering services support project, task 2 --- the use of aircraft instruments, flight simulation techniques, and mathematical models to understand wind shear effects during aircraft approach and takeoff
[AD-A080589] N80-20242

AIRCRAFT LANDING
Airborne aids for coping with low-level wind shear. All-weather landing systems, engineering services support project, task 2 --- the use of aircraft instruments, flight simulation techniques, and mathematical models to understand wind shear effects during aircraft approach and takeoff
[AD-A080589] N80-20242
Development of wind shear models and determination of wind shear hazards
[AD-A080588] N80-20243
Inertially augmented approach couplers
[AD-A080488] N80-20248

AIRCRAFT MANEUVERS
Aircraft motion sensitivity to dynamic stability derivatives --- motion simulation studies using cross coupling derivatives on fighter/ bomber aircraft
[AD-A079421] N80-20283

AIRCRAFT NOISE
Development and evaluation of a general aviation real world noise simulator
[NASA-CR-159237] N80-21100

AIRCRAFT PARTS
Thermal response and reusability tests of advanced flexible Reusable Surface Insulation (RSI) and ceramic tile RSI samples at surface temperatures to 1200 degrees F
[AD-A077887] N80-20399

AIRCRAFT PERFORMANCE
Technology requirements and readiness for very large aircraft
[NASA-TM-81783] N80-20223
Example of performance analysis using data obtained concurrently in air-path, body and Earth axes
[ESDU-79018] N80-20225
Optimum subsonic, high-angle-of-attack nacelles
[NASA-TM-81491] N80-20275

AIRCRAFT PILOTS
Summary of Department of Transportation/Federal Aviation Administration task force on crew workload report
[AD-A068189] N80-21032
AIRCRAFT RELIABILITY
Preliminary airworthiness evalaution, AH-1G with the airborne target acquisition fire control system and the hellfire modular missile system installed
[AD-A078340] N80-20265
AIRCRAFT SAFETY
Operational implications of some NACA/NASA rotary wing induced velocity studies
[NASA-TM-80232] N80-20231
Development of a bird/aircraft strike hazard assessment methodology
[AD-A075584] N80-20246
Summary of Department of Transportation/Federal Aviation Administration task force on crew workload report
[AD-A068189] N80-21032
AIRCRAFT SPIN
A spin-recovery parachute system for light general-aviation airplanes
[NASA-TM-80237] N80-20227
AIRCRAFT STABILITY
An approximate analysis of wing unsteady aerodynamics
[AD-A079322] N80-20239
Aircraft motion sensitivity to dynamic stability derivatives --- motion simulation studies using cross coupling derivatives on fighter/ bomber aircraft
[AD-A079421] N80-20283
AIRCRAFT STRUCTURES
Design, fabrication and test of graphite/polyimide composite joints and attachments for advanced aerospace vehicles
[NASA-CR-159110] N80-20316
AIRFOILS
Development of stability methods for applications to nonlinear aeroelastic optimization
[AD-A077851] N80-20282
AIRFRAMES
The prediction of mass loaded natural frequencies and forced response of complex, rib-stiffened structures
[AD-A079856] N80-20625
AIRPLANE PRODUCTION COSTS
Application of Bayesian approach to updating air frame CERs
[AD-A077064] N80-21064
AIRPORT PLANNING
Airport ground access
[AD-A068974] N80-20284
Airport obstacle maps N80-20673
AIRPORT TOWERS
Standard engineering installation package AN/TSQ-117, aircraft control central
[AD-A079776] N80-20254
AIRPORTS
Airfield pavement evaluation, volume 4. A bibliography with abstracts
[NTIS/PS-79/0754/6] N80-20288
The pressuremeter: Application of pavement design --- airport runways N80-20432
Inferred climatology for U.S. airports
[AD-A080487] N80-20987
ALASKA
Geophisical atlas N80-20734
ALFALFA
Monitoring drought in Colorado with LANDSAT MSS N80-20770
ALGORITHMS
Simulation of a navigator algorithm for a low-cost GPS receiver
[NASA-TM-81778] N80-20251
Noise suppression methods for robust speech processing
[AD-A079321] N80-20456
Comparison of algorithms for the summation of spherical plane functions N80-20699
A non-Gaussian stochastic model applied to deconvolution and seismogram inversion N80-20961
Fast parallel realization of matrix multiplication
[AD-A080074] N80-21063
Impact of vector processors on algorithms
[LA-8123-MS] N80-21080
Local search for the asymmetric traveling salesman problem
[PB80-118532] N80-21096
ALIPHATIC COMPOUNDS
Thermal conductivity of liquid carboxylic acids
[ESDU-79029] N80-20328
Vapour pressures and critical points of liquids. 14: Aliphatic oxygen-nitrogen compounds
[ESDU-79030] N80-20329
ALKALI METALS
Measurements and calculations of electronic excitation from collisions between atoms of alkalis and mercury in the energy range 10 eV to 1400 eV
[MPIS-24/1978] N80-21181
ALLOYS
Development of a procedure for estimating the high cycle fatique strength of some high temperature structural alloys
[BNL-NUREG-26085] N80-20378
ALPHA PARTICLES
Method and means for helium/hydrogen ratio measurement by alpha scattering
[NASA-CASE-NPO-14079-1] N80-20334
Techniques for measuring the alpha-particle distribution in magnetically confined plasmas
[PPPL-1592] N80-21164
Velocity space instabilities of alpha particles in Tokamak reactors --- plasma frequency instabilities due to hollow isotropic alpha velocity distributions
[DOE/TIC-11016] N80-21167
ALPS MOUNTAINS (EUROPE)
Regional modeling: The Ivrea zone --- Northern Italy N80-20731
Geophisical atlas N80-20734
ALTIMETERS
Contributions to the utilization of altimeter data N80-20644
Information relative to cartography and geodesy. Series 2: Translations
[REPT-37] N80-20714
On orbital fitting with altimeter data N80-20715
On a mathematical model for remote sensing altimetry N80-20716
The effect of sea state on altimeter measurements N80-20759
Mean sea surface computation using GEOS-3 altimeter data N80-20760
ALUMINUM
Dynamic modulus and damping of boron, silicon carbide, and alumina fibers
[NASA-TM-81422] N80-20313
Application of inelastic electron tunneling spectroscopy to the study of inhibition of aluminum corrosion N80-20367
Internal quality of aluminum die castings N80-20601
Resource and energy constraints of regional and global availability of aluminum copper, and iron 1975 - 2000: A computer study N80-20720
ALUMINUM ALLOYS
X-ray analysis of accrued damage in stress corrosion and corrosion fatigue --- 304 austenitic stainless steel and al 2024
[AD-A078511] N80-20372
Production of aluminum-silicon alloy and ferrosilicon and commercial purity aluminum by the direct reduction process, phase B
[CONS/5089-7] N80-20382
Inertia and friction welding of aluminum alloy 1100 to type 316 stainless steel
[Y-2165-REV] N80-20596
ALUMINUM COATINGS
An experimental, low-cost, silicon-aluminide high-temperature coating for superalloys
[NASA-TM-81455] N80-20370
AMBIENT TEMPERATURE
Rechargeable ambient temperature lithium cells N80-20833
AMERICIUM
Chemistry research and development --- americium and plutonium recovery and purification
[RFP-2952] N80-20309
Decontamination of metals containing plutonium and americium
[ANL-78-13] N80-20599
AMMETERS
Life test results of the NASA standard 20 ampere hour cells N80-20846
AMORPHOUS MATERIALS
Crystallization and irradiation effects in an amorphous alloy of type Fe40Ni38Mo4B18
[PNL-TR-372] N80-20390
Influence of magnetic ordering on the superconducting properties of amorphous (Zr/sub 1-x/Er/sub x/)3Rh alloys
[CALT-822-110] N80-20502
AMPLIFIERS
Multiband Klystron study
[AD-A078036] N80-20490
ANAEROBES
Production of methane using an anaerobic filter
[ANL-TRANS-1164] N80-20428
ANALOG CIRCUITS
GaAs analog integrated circuits (GaAs RF-LSI), phase 1. Volume 2: Appendices
[AD-A079589] N80-20496
GaAs analog integrated circuits (GaAs RF-LSI), volume 1 --- microwave receivers
[AD-A079588] N80-20497
ANALOG DATA
The future of analytical evaluation equipment --- image measurement techniques N80-20670
Digitizing of geometic data for thematic mapping: State-of-the-art and future developments N80-20687
ANALOG TO DIGITAL CONVERTERS
On precision in the gathering and production of cartographic data N80-20657
The production of photomaps from tidal flat areas N80-20682
Testing the accuracy of cartographic equipment: First results N80-20683
Digitizing of geometic data for thematic mapping: State-of-the-art and future developments N80-20687
Data capture for cartographic data bases N80-20689
Experiments in digitizing line structures by a raster scan process
[GMD-MITT-37] N80-20793
Determination of lines and nodes from images
[GMD-MITT-44] N80-20794
ANALYSIS (MATHEMATICS)
Probabilistic method for grouping data
[ORNL/CSD/TM-65] N80-21095
ANALYSIS OF VARIANCE
Sources of variations in LANDSAT autocorrelation --- Richmond, Virginia and Denver, Colorado N80-20767
Consistent estimation of variance parameters from many small samples with different means
[AD-A078227] N80-21087
ANGULAR DISTRIBUTION
Noncontacting method for measuring angular deflection
[NASA-CASE-LAR-12178-1] N80-21138
ANGULAR MOMENTUM
Angular momentum transfer in deeply inelastic collisions
[RLO-1388-395] N80-21111
ANIONS
Determination of selected anions in water by ion chromatography
[PB80-111941] N80-20356
ANISOTROPY
Thermal anisotropy of vegetation canopies --- Phoenix, Arizona N80-20773
ANNEALING
Investigation of elongation of boron filament during fabrication and annealing N80-20310
CDS solid state phase insensitive ultrasonic transducer --- annealing cadmium sulfide crystals
[NASA-CASE-LAR-12304-1] N80-20559
ANODES
Models for the photoelectrolytic decomposition of water at semiconducting oxide anodes
[AD-A079469] N80-20343
ANTENNA RADIATION PATTERNS
Theoretical and experimental study of the proximity effects of thin-wire antenna in pressure of biological bodies --- electromagnetic radiation effects N80-20451
ANTENNAS
On the physical realizability of broadband lumped-parameter equivalent circuits for energy-collecting structures
[AD-A079962] N80-20499

ANTHROPOMETRY
Establishment of the repeatability of performance of the SA103C three year old child test dummies
[PB80-112204] N80-21036
ANTIBODIES
On the cellular autoimmune mechanism for eliminating erythrocytes normally and under extreme influences
[NASA-TM-75735] N80-21014
ANTIFRICTION BEARINGS
Gas bearings, volume 2. Citations from the NTIS data base
[PB80-802499] N80-20800
ANTINEUTRINOS
Comparison of jet size in anti-neutrino proton interactions with that in positron electron annihilation
[ANL-HEP-PR-79-17] N80-21117
APOLLO PROJECT
The Apollo spacecraft: A chronology volume 4, 21 January 1966 - 13 July 1974
[NASA-SP-4009] N80-20437
APOLLO SPACECRAFT
The Apollo spacecraft: A chronology volume 4, 21 January 1966 - 13 July 1974
[NASA-SP-4009] N80-20437
APPROACH
Inertially augmented approach couplers
[AD-A080488] N80-20248
APPROXIMATION
Development of stability methods for applications to nonlinear aeroelastic optimization
[AD-A077851] N80-20282
A diagonally dominant solution for the cylinder end problem and a non-axisymmetric elasticity solution for a truncated spherical dome N80-20612
Problems of approximation by means of sampling functions N80-20700
Absorption characteristics of prolate spheroidal model of man and animals at and near resonance frequency
[PB80-108293] N80-21028
AQUICULTURE
Delaware sea grant college program
[PB80-122401] N80-21011
ARCHITECTURE
Seismic design of reinforced concrete buildings: An inelastic response spectrum approach --- earthquake resistant structures beams (supports) N80-20433
ARCHITECTURE (COMPUTERS)
Mechanization architecture for enhancement of avionics planning data base
[AD-A075572] N80-20267
Design and performance of local computer networks N80-21049
Impact of vector processors on algorithms
[LA-8123-MS] N80-21080
ARGON LASERS
A study of the collision processes in the thermic energy region by using atoms excited by laser light
[MPIS-2/1978] N80-20584
ARID LANDS
Heat Capacity Mapping Mission (HCMM) --- australia
[E80-10066] N80-20721
Water resources in and and semiarid regions. A bibliography with abstracts
[PB80-802259] N80-20795
ARIZONA
Effects of wheat irrigation frequency on reflectance in selected spectral bands --- Phoenix, Arizona N80-20771
Thermal anisotropy of vegetation canopies --- Phoenix, Arizona N80-20773
Time of day effects on wheat reflectance in fifteen selected bands --- Phoenix, Arizona N80-20774
AROMATIC COMPOUNDS
Evaluation of sensitized fluorescence for polynuclear aromatic hydrocarbon detection --- in combustion products
[PB80-108475] N80-20358
ARRAYS
Thermistor array impedance considerations
[AD-A079886] N80-20492
PARRAY technical papers presented at scientific and technical meetings
[AD-A077726] N80-21104
ARTERIES
Effects of hypokinesia and hypodynamia on the intraorganic arteries of the heart
[NASA-TM-76069] N80-21026
ARTERIOSCLEROSIS
Atherosclerotic changes of vessels caused by restriction of movement
[NASA-TM-76022] N80-21020
ARTIFICIAL INTELLIGENCE
K-lines: A theory of memory
[AD-A078116] N80-21030
Sequins and quilts: Representations for surfaces topography
[AD-A078068] N80-21097
Directional selectivity and its use in early visual processing --- construction of directionally selective units and their use in processing visual motion
[AD-A078054] N80-21144
ARTIFICIAL SATELLITES
Motion of artificial Earth satellites in related orbits N80-20703
ASIA
Geophysical atlas N80-20734
Gravity model development N80-20748
ASPECT RATIO
The effects of pitching rate on the hydrodynamic properties of hydrofoils
[AD-A079810] N80-20438
ASPHALT
Structural evaluation of sulphur-asphalt pavements N80-20436
ASSAYING
Trace characterization of metals in solid samples and air pollutants N80-20918
ASSEMBLING
Aerospace electrode line N80-20859
ASTRONOMICAL COORDINATES
Elaborating an astronomical longitude system N80-20647
Determination of azimuth and astronomical coordinates N80-20648
ASTRONOMICAL TELESCOPES
Superconducting magnet system for the SPIRIT cosmic ray space telescope
[LBL-9699] N80-21225
The rotation of the Sun: Observations at Stanford --- using the Doppler effect
[NASA-CR-162914] N80-21240
ASYMPTOTIC METHODS
Local asymptotic normality for progressively censored likelihood ratio statistics and applications
[AD-A077005] N80-21086
ASYMPTOTIC SERIES
Asymptotic eigenstructures
[NASA-CR-162900] N80-21050
ATLANTIC OCEAN
Ocean circulation N80-20761
Monthly climatology for evaporation duct occurrence in the North Atlantic Ocean
[AD-A075524] N80-20992
ATMOSPHERIC ATTENUATION
An improved model for the calculation of longwave flux at 11 micrometers --- satellite radiance measurements
[PB80-119431] N80-20981
ATMOSPHERIC CHEMISTRY
Validation of the Dairchem code 1: Quiet midlatitude conditions
[AD-A077880] N80-20965
ATMOSPHERIC CIRCULATION
Summer circulation over South America from satellite data N80-20983
ATMOSPHERIC DENSITY
Long-period terms in the neutral density of the upper atmosphere
[PB80-119464] N80-20978
An investigation and analysis of the density and thermal balance of the Martian ionosphere N80-21230
ATMOSPHERIC DIFFUSION
Atmospheric transport of acidity in southern California by wet and dry mechanisms N80-20917
Theoretical analysis of perturbation solutions to the problem of inertial capture of aerosol particles
[RLO-2227-727-7] N80-20927
Basic studies flow and diffusion over hills
[PB80-112014] N80-20986
ATMOSPHERIC EFFECTS
Effect of weather at Hannover, Federal Republic of Germany, on performance of electrooptical imaging systems. Part 3: Uncertainties in comparison of FLIR performance in the 3-5 and 8-12 micrometers bands
[AD-A079574] N80-21147
ATMOSPHERIC ELECTRICITY
The present status of atmospheric electricity, report of the USRA atmospheric electricity study panel
[PB80-111479] N80-20979
ATMOSPHERIC ENTRY
Wake flowfields for Jovian probe
[NASA-CR-159235] N80-20230
ATMOSPHERIC HEATING
A study of magnetogravity waves N80-20955
ATMOSPHERIC MODELS
User's guide for numerical modeling of buoyant plumes in a turbulent, stratified atmosphere
[PB80-114549] N80-20946
Long-period terms in the neutral density of the upper atmosphere
[PB80-119464] N80-20978
Meteorological data, series A monographs. Volume 3, no. 1: A study of prediction of characteristic synoptic structures with the aid of a numerical model of the humid atmosphere N80-20984
Adaptation and optimization of a line-by-line radiative transfer program for the STAR-100 (STARSMART)
[NASA-CR-159238] N80-21044
ATMOSPHERIC MOISTURE
Precipitation and accumulation estimates for East Antarctica, derived from rawinsonde information N80-20956
A test of the climatic normality of synthetic profiles of atmospheric liquid water content over the USSR in 1973
[AD-A077021] N80-20990
ATMOSPHERIC TURBULENCE
User's guide for numerical modeling of buoyant plumes in a turbulent, stratified atmosphere
[PB80-114549] N80-20946
ATMOSPHERICS
A model of natural HF radio noise in severely disturbed propagation environments
[AD-A077619] N80-20474
The present status of atmospheric electricity, report of the USRA atmospheric electricity study panel
[PB80-111479] N80-20979
ATOMIC COLLISIONS
Determination of molecular-ion structures through studies of the collisionally-induced dissociation of fast (MeV) molecular ions
[CONF-790843-10] N80-21116
Transport properties in the atmosphere of Jupiter
[NASA-CR-162897] N80-21234
ATOMIC EXCITATIONS
Measurements and calculations of electronic excitation from collisions between atoms of alkalis and mercury in the energy range 10 eV to 1400 eV
[MPIS-24/1979] N80-21181
ATOMIC SPECTRA
Atomic and molecular gas phase spectrometry
[AD-A079657] N80-20350
ATOMIC STRUCTURE
Influence of magnetic ordering on the superconducting properties of amorphous (Zr/sub 1-x/Er/sub x/)3Rh alloys
[CALT-822-110] N80-20502
Studies in the electronic structure of matter
[COO-1198-1268] N80-21174
ATOMIC THEORY
Studies in the electronic structure of matter
[COO-1198-1268] N80-21174
AUDITORY PERCEPTION
Plasma cortisol levels and auditory functioning in humans exposed to short and prolonged durations of noise N80-21018
AUSTENITIC STAINLESS STEELS
X-ray analysis of accrued damage in stress corrosion and corrosion fatigue --- 304 austenitic stainless steel and al 2024
[AD-A078511] N80-20372
AUSTRALIA
Heat Capacity Mapping Mission (HCMM) --- australia
[E80-10066] N80-20721
Crustal anomaly representation N80-20728
Gravity model development N80-20748
AUSTRIA
The German-Austrian Doppler Observation Campaign N80-20696
AUTOCORRELATION
Sources of variations in LANDSAT autocorrelation --- Richmond, Virginia and Denver, Colorado N80-20767

AUTOMATED MIXED TRAFFIC VEHICLES
AMTV headway sensor and safety design
[NASA-CR-162717] N80-21203
AUTOMATIC TEST EQUIPMENT
An operating and support cost model for avionics automatic test equipment --- f-16 aircraft
[AD-A075586] N80-20269
AUTOMATION
Development of automated welding processes for field fabrication of thick-walled pressure vessels: Electron beam method
[FE-2606-T1] N80-20597
AUTOMOBILE ACCIDENTS
An assessment of the risks presented by carbon fiber composites released from motor vehicle fires
[NASA-CR-159207] N80-20311
AUTOMOBILE ENGINES
Effect of water injection and off scheduling of variable inlet guide vanes, gas generator speed and power turbine nozzle angle on the performance of an automotive gas turbine engine
[NASA-TM-81415] N80-20272
Combustion and operating characteristics of spark-ignition engines
[NASA-CR-162896] N80-20340
Supporting research and technology for automotive Stirling engine development
[NASA-TM-81495] N80-21200
Fuel economy screening study of advanced automotive gas turbine engines
[NASA-TM-81433] N80-21201
AUTOMOBILES
Hydrogen storage for automobiles
[BNL-26906] N80-20886
Electric and hybrid vehicle program
[DOE/CS-0026-7] N80-21204
Energy storage systems for automobile propulsion
[UCID-18320] N80-21211
Collision avoidance radar braking systems investigation, phase 3 study
[PB80-108939] N80-21218
Development of aerodynamic disturbance test procedures. Volume 2: Technical report
[PB80-118383] N80-21219
AUXILIARY POWER SOURCES
TDRSS battery life cycle tests interim report
N80-20845
AVIONICS
Advanced FIREFLY assessment generalized mechanization requirements report
[AD-A079752] N80-20263
Mechanization architecture for enhancement of avionics planning data base
[AD-A075572] N80-20267
A study of two avionics life cycle cost models and their applicability
[AD-A076981] N80-20268
An operating and support cost model for avionics automatic test equipment --- f-16 aircraft
[AD-A075586] N80-20269
The vulnerability of commercial aircraft avionics to carbon fibers
[NASA-CR-159213] N80-20317
A standardization evaluation potential study of the common multi-mode radar program
[AD-A079678] N80-20459
AXES OF ROTATION
Polar motion research N80-20755
AXIAL COMPRESSION LOADS
Analytical/experimental investigation of the instability of composite cylindrical panels
[AD-A079850] N80-20628
AXIAL FLOW
Aerodynamics of advanced axial-flow turbomachinery
[AD-A079617] N80-20277
Fluid mechanics, internal flow sub-series. Volume 7: A guide to fan selection and performance
[ESDU-79037] N80-20511
AXIAL FLOW TURBINES
Aerodynamics of advanced axial-flow turbomachinery
[AD-A079617] N80-20277
AZIMUTH
Determination of azimuth and astronomical coordinates N80-20648
Time of day effects on wheat reflectance in fifteen selected bands --- Phoenix, Arizona N80-20774

B

BACKGROUND RADIATION
Near-millimeter wave technology base study. Volume 1: Propagation and target/background characteristics
[AD-A079620] N80-20461
BACKSCATTERING
Remote sensing of ocean surface current and current shear by HF backscatter radar N80-20718
Backscattering of electromagnetic waves from electrostatic waves in a magnetized plasma
N80-21153
BALANCE
Rotor model parameters estimation and rotor balancing studies with quadratic programming
N80-20587
BALLISTIC TRAJECTORIES
The particle dynamics of target penetration
[AD-A077114] N80-20592
BANDWIDTH
Speech bandwidth reduction
[PB80-103955] N80-20479
BARIUM ION CLOUDS
Preliminary report of numerical simulations of intermediate wavelength ExB gradient drift instability in ionospheric plasma clouds
[AD-A079313] N80-20968
BARLEY
Monitoring drought in Colorado with LANDSAT MSS N80-20770
BAROCLINIC WAVES
Nongeostrophic baroclinic instability of two fluids --- stability analysis of fluid in a rotating cylinder
N80-20517
BARREN LAND
Surface mine monitoring --- Pennsylvania
N80-20764
BASALT
Strontium isotopic and trace element geochemistry of the Saddle Mountains and Grande Ronde Basalts of the Columbia River Basalt group N80-20958
Hotspots and the evolution of the mantle
[NASA-CR-162906] N80-20964
Determination of basalt physical and thermal properties at varying temperatures, pressures, and moisture contents
[RHO-BWI-C-55] N80-20971
Determination of basalt physical and thermal properties at varying temperatures, pressures, and moisture contents
[RHO-BWI-C-54] N80-20972
BATCH PROCESSING
Locational characteristics and the sequence of computer assisted processes of cartographic generalization N80-20685
BATHYMETERS
Bathymetric data reduction subsystem
[AD-A079624] N80-21008
BAYES THEOREM
Application of Bayesian approach to updating air frame CERs
[AD-A077064] N80-21064
Some contributions to gamma-minimax and empirical Bayes selection procedures N80-21085
Smoothness priors and the distributed lag estimator
[AD-A075574] N80-21090
BAYS (TOPOGRAPHIC FEATURES)
Hydrographic observations in the Georgia Bight (April 1978)
[PB80-111453] N80-21012
BEAM CURRENTS
Random signal flaw detection
[AD-A078443] N80-21103
BEAMS (RADIATION)
Nuclear collision at E/A is equivalent to T/ sub F/
[LBL-9520] N80-21121
Method and apparatus for Doppler frequency modulation of radiation
[NASA-CASE-NPO-14524-1] N80-21141
BEDS (PROCESS ENGINEERING)
Photochemical conversion of coal to gasoline in an entrained bed reactor
[ORO-5020-T1] N80-20415
BERMUDA
The SEASAT altimeter height bias using four Bermuda overflights N80-20758
The effect of sea state on altimeter measurements
N80-20759
BERYLLIUM
Influence of purity level on the mechanical properties of hot isostatically pressed beryllium
[SAND-79-8232] N80-20377
BERYLLIUM COMPOUNDS
Structure and properties of glasses --- beryllium fluoride glass
[AD-A080071] N80-20400
BETA PARTICLES
Beta gauge operation manual
[PB80-112337] N80-20937
BIAS
Studies of the statistical bias and signal characteristics of laser velocimeters
[AD-A079634] N80-20579
BIBLIOGRAPHIES
Inertial navigation and guidance, volume 2. A bibliography with abstracts
[NTIS/PS-79/0762/9] N80-20259
Airfield pavement evaluation, volume 4. A bibliography with abstracts
[NTIS/PS-79/0754/6] N80-20288
Stress corrosion of steel. A bibliography with abstracts
[PB80-803729] N80-20394
Tropospheric scatter communications. A bibliography with abstracts
[NTIS/PS-79/0750/4] N80-20478
Boundary layer transition, volume 4. A bibliography with abstracts
[PB80-803265] N80-20555
Gallium arsenide lasers. A bibliography with abstracts
[PB80-803612] N80-20585
Hydrogen fluoride and deuterium fluoride lasers, Volume 2. A bibliography with abstracts, 1976-1979
[PB80-803273] N80-20586
Gas bearings, volume 2. Citations from the NTIS data base
[PB80-802499] N80-20600
Earth resources. A continuing bibliography with indexes, issue 24
[NASA-SP-7041(24)] N80-20717
Water resources in arid and semiarid regions. A bibliography with abstracts
[PB80-802259] N80-20795
Energy information data base
[DOE/TIC-4579-R10-SUPPL-6] N80-20881
Wind energy information directory
[SERI/SP-69-290] N80-20883
Solar water pumps. Citations from the Engineering Index data base
[PB80-802531] N80-20910
Remote sensing applied to pollution monitoring. Citations from the International Aerospace Abstracts data base

National geodetic survey data: Availability, explanation and application
[PB80-118615] N80-20977
Signs and display systems: Graphic design and human engineering. A bibliography with abstracts
[PB80-803158] N80-21031
Microcomputers: General applications, part 1, volume 4. Citations from the Engineering Index data base
[NTIS/PS-79/0726/4] N80-21041
High energy particle physics research
[SAN-0034-191-T1] N80-21136
NASA patent abstracts bibliogrpahy. A continuing bibliography. Section 1: Abstracts, supplement 16
[NASA-SP-7039(16)] N80-21190
Management information systems, volume 2. A bibliography with abstracts
[PB80-802739] N80-21193
BILLETS
Influence of purity level on the mechanical properties of hot isostatically pressed beryllium
[SAND-79-8232] N80-20377
BIOASSAY
Interpretation of environmental assessment data
[PB80-108160] N80-20933
BIODEGRADATION
Production of methane using an anaerobic filter
[ANL-TRANS-1164] N80-20428
Biodegradation and treatability of specific pollutants
[PB80-106438] N80-20932

BIOELECTRICITY
Initial dynamics of the EKG during an electrical defibrillation of the heart
[NASA-TM-76002] N80-21019
Cold shivering activity after unilateral destruction of the vestibular apparatus
[NASA-TM-76099] N80-21021
BIOLOGICAL EFFECTS
Theoretical and experimental study of the proximity effects of thin-wire antenna in pressure of biological bodies --- electromagnetic radiation effects
N80-20451
Induced electromagnetic fields in conducting bodies irradiated by magnetic fields and microwaves
N80-20452
BIOMASS
Off-nadir viewing effects on spectral assessment of green biomass N80-20772
Assessing soybean leaf area and leaf biomass by spectral measurements — Beltsville, Maryland Agricultural Research Center N80-20775
A spectral method for determining the percentage of green herbage material in clipped samples
N80-20780
Evaluation of a spectral method for percentage green determination using clipped rangeland forage samples --- Texas N80-20781
BIOMASS ENERGY PRODUCTION
Survey of biomass gasification. Volume 1: Synopsis and executive summary
[SERI/TR-33-239-VOL-1] N80-20427
Biomass energy systems: Environmental readiness document
[DOE/ERD-0021] N80-20905
BIONICS
K-lines: A theory of memory
[AD-A078116] N80-21030
Establishment of the repeatability of performance of the SA103C three year old child test dummies
[PB80-112204] N80-21036
BIOSPHERE
A global biogeocenotical biosphere simulation
[NASA-TM-76042] N80-20920
BIRD-AIRCRAFT COLLISIONS
Development of a bird/aircraft strike hazard assessment methodology
[AD-A075584] N80-20246
BISMUTH
Bismuth: Mineral commodity profiles, August 1979
[PB80-111438] N80-20361
BLOCK DIAGRAMS
Nearly balanced incomplete block designs
[AD-A079726] N80-21094
BLOOD
Coagulating activity of the blood, vascular wall, and myocardium under hypodynamia conditions
[NASA-TM-76056] N80-21023
BLOOD COAGULATION
Coagulating activity of the blood, vascular wall, and myocardium under hypodynamia conditions
[NASA-TM-76056] N80-21023
BLOOD PRESSURE
Atherosclerotic changes of vessels caused by restriction of movement
[NASA-TM-76022] N80-21020
BLOOD VESSELS
Atherosclerotic changes of vessels caused by restriction of movement
[NASA-TM-76022] N80-21020
BLUNT BODIES
Real-gas effects on the aerodynamics of blunt cones as measured in a hypervelocity range
[AD-A075526] N80-20241
Complete supersonic flowfields over blunt bodies in a generalized orthogonal coordinate system
[NASA-TM-81784] N80-20529
BOEING 747 AIRCRAFT
JT9D-7A (SP) jet engine performance deterioration trends
[NASA-TM-81459] N80-20274
BOLTS
Use of two-dimensional transmission photoelastic models to study stresses in double-lap bolted joints: Load transfer and stresses in the inner lap
[VPI-E-80-9] N80-20621
BOLTZMANN TRANSPORT EQUATION
The Boltzmann equation with a soft potential. Part 1: Linear, spatially-homogeneous
[AD-A079706] N80-21068
BOMBER AIRCRAFT
The development of rapid predictive methods for three-dimensional transonic flow fields about fighter bomber aircraft, part 1
[AD-A078683] N80-20236
Aircraft motion sensitivity to dynamic stability derivatives --- motion simulation studies using cross coupling derivatives on fighter/ bomber aircraft
[AD-A079421] N80-20283
BORESIGHTS
Millstone Hill Radio Star Calibration
[AD-A079037] N80-20475
BORIDES
Roles of crystal fields in magnetic superconducting rare-earth rhodium borides
[LA-UR-79-3174] N80-21175
BORON FIBERS
Investigation of elongation of boron filament during fabrication and annealing N80-20310
Dynamic modulus and damping of boron, silicon carbide, and alumina fibers
[NASA-TM-81422] N80-20313
Calculation of residual principal stresses in CVD boron on carbon filaments
[NASA-TM-81456] N80-20314
BOROSILICATE GLASS
Ultrapure glass optical waveguide development in microgravity by the sol-gel process
[NASA-CR-162910] N80-21142
BOUNDARIES
Shape segmentation using relaxation
[AD-A078084] N80-21060
BOUNDARY LAYER EQUATIONS
Introduction to computational techniques for boundary layers
[SAND-79-0893] N80-20550
BOUNDARY LAYER FLOW
Stability and transition of wave induced boundary layer flows N80-20226
Numerical solution of the two-dimensional incompressible averaged Navier-Stokes equations for finite arbitrary shaped isolated bodies, part 1
[AD-A080093] N80-20544
Introduction to computational techniques for boundary layers
[SAND-79-0893] N80-20550
BOUNDARY LAYER STABILITY
Stability and transition of wave induced boundary layer flows N80-20226
A contribution to the stability of electrically conducting Boussinesq fluids by the energy method
N80-20522
BOUNDARY LAYER TRANSITION
Detection of the transitional layer between laminar and turbulent flow areas on a wing surface --- using an accelerometer to measure pressure levels during wind tunnel tests
[NASA-CASE-LAR-12261-1] N80-20224
Stability and transition of wave induced boundary layer flows N80-20226
Boundary layer transition, volume 4. A bibliography with abstracts
[PB80-803265] N80-20555
Holographic interferometric survey of boundary layer transition in an axisymmetric free convection thermal boundary layer
[AD-A079880] N80-20567
BOUNDARY VALUE PROBLEMS
Dynamic Green's functions for layered media and applications to boundary-value problems --- for earthquake engineering in viscoelastic media
N80-20431
Investigation of transform techniques for solving electromagnetic radiation and scattering problems
[AD-A077895] N80-20456
On the physical realizability of broadband lumped-parameter equivalent circuits for energy-collecting structures
[AD-A079962] N80-20499
A numerical study of normal-shock/turbulent boundary layer interactions
[AD-A079858] N80-20537
Finite-amplitude solitary water waves
[AD-A079718] N80-20546
Time-dependent inelastic analysis by the boundary element method and the finite element method
N80-20616
Energy release rate calculations for interface edge cracks based on a conservation integral
[AD-A079723] N80-20626
High order finite difference methods for elliptic boundary value problems N80-21042
An estimate related to the strong maximum principle
[AD-A079705] N80-21065
The Boltzmann equation with a soft potential. Part 1: Linear, spatially-homogeneous
[AD-A079706] N80-21068
BOUSSINESQ APPROXIMATION
A contribution to the stability of electrically conducting Boussinesq fluids by the energy method
N80-20522
BRAGG ANGLE
Studies of the statistical bias and signal characteristics of laser velocimeters
[AD-A079634] N80-20579
BRAKES (FOR ARRESTING MOTION)
Collision avoidance radar braking systems investigation, phase 3 study
[PB80-108939] N80-21218
BRILLOUIN EFFECT
Brillouin scattering in xenon near the critical point
N80-21099
BRITTLENESS
Materials and mechanics of rate effects in brittle fracture --- cantilever beams and steels
[COO-2422-22] N80-20635
BROADBAND
On the physical realizability of broad-band equivalent circuits for wire loop and dipole antennas
[AD-A079961] N80-20498
On the physical realizability of broadband lumped-parameter equivalent circuits for energy-collecting structures
[AD-A079962] N80-20499
BUBBLE MEMORY DEVICES
Magnetic bubble research
[AD-A078702] N80-21040
BUBBLE TECHNIQUE
Magnetic bubble research
[AD-A078702] N80-21040
BUBBLES
The dynamics of an ultrasonic cavitation bubble
N80-20520
BUCKLING
Column buckling of isotropic and composite beams using a truncated Fourier series
[AD-A079862] N80-20629
Dynamic buckling of a rigid-plastic cylindrical shell: A second order differential equation subject to four boundary conditions
[COO-4122-29] N80-20636
Extension of the Vaughan-Florence analysis of dynamic buckling of a rigid-plastic cylindrical shell
[COO-4122-28] N80-20637
BUILDINGS
Assessment of environmental wind conditions by wind tunnel model studies --- buildings
[PB80-115926] N80-20445
BUOYANCY
Purely buoyant diffusion flames: Some experimental results
[PB80-112113] N80-20364
User's guide for numerical modeling of buoyant plumes in a turbulent, stratified atmosphere
[PB80-114549] N80-20946
BURNING RATE
Asymptotic analysis of near-stoichiometric flame propagation N80-20330
How to burn coal efficiently and economically, and meet air pollution requirements: The fluidized-bed combustion process
[PB80-107501] N80-20911
BUTANES
Normal butane: Provisional thermodynamic functions from 135 to 700 K at pressures to 700 bar
[PB80-118193] N80-20365

C

CADASTRAL MAPPING
Computer-assisted thematic mapping for federal planning N80-20686
CADMIUM
Cadmium
[PB80-111420] N80-20362
CADMIUM COMPOUNDS
Cadmium
[PB80-111420] N80-20362

CADMIUM SULFIDES
CDS solid state phase insensitive ultrasonic transducer --- annealing cadmium sulfide crystals
[NASA-CASE-LAR-12304-1] N80-20559
CALCULUS OF VARIATIONS
Effect of imperfections on the collapse of rectangular plates using variational calculus
[AD-A079905] N80-20627
CALIBRATING
Satellite calibration data, annual data report
[AD-A075602] N80-20301
Millstone Hill Radio Star Calibration
[AD-A079037] N80-20475
A calibration of the Preston tube in liquid flow systems
[AD-A079876] N80-20538
The SEASAT altimeter height bias using four Bermuda overflights N80-20758
Six-foot line transducer calibration procedure: Explains theory, methodology, and procedures used at Sensor Accuracy Check Site (SACS), Long Beach, California
[AD-A079522] N80-21102
CALIFORNIA
Earth Survey Applications Division: Research leading to the effective use of space technology in applications relating to the Earth's surface and interior
[E80-10084] N80-20722
On the slection of station sites for observing strain steps and earthquake forerunners in California N80-20740
Earthquake and crustal deformation studies --- San Francisco and Fort Ross, California N80-20743
Crustal motion measurements in California (SAFE) N80-20746
Mantle convection and subcrustal stress N80-20752
The spaceborne laser ranging system N80-20785
Marine geology and tectonic evolution of the northwestern margin of the California continental borderland N80-20959
CANTILEVER BEAMS
Materials and mechanics of rate effects in brittle fracture --- cantilever beams and steels
[COO-2422-22] N80-20635
CAPES (LANDFORMS)
Gravity model development N80-20748
CARBON
Low temperature thermal conductivities of glassy carbons
[COO-1198-1280] N80-20323
Measurement of electrical conductivity in carbon/epoxy composite material over the frequency range 75 MHz to 2.0 GHz
[AD-A078008] N80-20489
CARBON DIOXIDE
International scientific interest in the question of CO2 induced climate change
[UCID-18332] N80-20985
CARBON DIOXIDE LASERS
Generation of 16 micron radiation using stimulated rotational Raman scattering in hydrogen --- using a CO2 TEA laser N80-20573
Separation control in all apt light pipe
[AD-A079904] N80-20577
Efficient high energy infrared third harmonic generation in gases and liquids for laser fusion applications --- carbon dioxide lasers
[COO-4251-7] N80-20581
CARBON FIBER REINFORCED PLASTICS
Damping of anisotropic composites studied from the properties of the rolled components
[ILR-41] N80-20324
CARBON FIBERS
An assessment of the risks presented by carbon fiber composites released from motor vehicle fires
[NASA-CR-159207] N80-20311
High electrical resistivity carbon/graphite fibers
[NASA-CR-162909] N80-20312
Calculation of residual principal stresses in CVD boron on carbon filaments
[NASA-TM-81456] N80-20314
The vulnerability of commercial aircraft avionics to carbon fibers
[NASA-CR-159213] N80-20317
Prediction and verification of moisture effects on carbon fiber-epoxy composites
[AD-A079557] N80-20320
Electrochemical polymerization and deposition on carbon fibers N80-20396
CARBON MONOXIDE
Coal liquefaction with synthesis gas
[PETC/TR-79/1] N80-20416
CARBON STEELS
Large-strain deformation of a mild steel at intermediate temperatures N80-20369
CARBON TETRACHLORIDE
Application of inelastic electron tunneling spectroscopy to the study of inhibition of aluminum corrosion N80-20367
CARBONATES
Performance model for molten carbonate fuel cells
[TR-190] N80-20884
CARBOXYLIC ACIDS
Thermal conductivity of liquid carboxylic acids
[ESDU-79029] N80-20328
CARCINOGENS
Formulation of a preliminary assessment of halogenated organic compounds in man and environmental media
[PB80-112170] N80-21029
CAROTENE
Spectra of isolated vegetational constituents N80-20779
CARRIER FREQUENCIES
Sampling digital multiple channel same frequency repeater study
[AD-A078817] N80-20472
CASCADE FLOW
Hot wire anemometer investigation of turbulence levels and development of liquid crystal flow visualization techniques for the rectilinear cascade test facility
[AD-A078284] N80-20533
CASES (CONTAINERS)
Portable heatable container
[NASA-CASE-NPO-14237-1] N80-20606
CASTING
Internal quality of aluminum die castings N80-20601
CASTINGS
Characterization of casting defects in typical castings of a directionally solidified superalloy
[AD-A077270] N80-20376
Internal quality of aluminum die castings N80-20601
CATALYSIS
Refining and upgrading of synfuels from coal and oil shales by advanced catalytic processes
[FE-2315-37] N80-20407
CATALYSTS
Kinetics and mechanisms of catalytic hydroliquefaction and hydrogasification of lignite
[FE-2702-7] N80-20421
Exploratory studies in catalytic coal liquefaction
[EPRI-AF-1184] N80-20422
Catalyst characterization in coal liquefaction
[SAND-79-1969] N80-20423
CATHODE RAY TUBES
A direct measure of CRT image quality
[AD-A075610] N80-21146
CAVITATION FLOW
Cavitation induced instabilities associated with turbomachines N80-20519
The dynamics of an ultrasonic cavitation bubble N80-20520
CAVITIES
Thermo-elastic-plastic stresses in hollow cylinders due to quenching
[AD-A077109] N80-20622
CELESTIAL REFERENCE SYSTEMS
Determination of variations of time dependent coordinates through astronomical and Doppler observations N80-20649
CENSORED DATA (MATHEMATICS)
Local asymptotic normality for progressively censored likelihood ratio statistics and applications
[AD-A077005] N80-21088
CENSUS
NASA-census Application Pilot Test (APT) and urban area delineation studies --- Seattle, Washington; Austin, Texas; Orlando, Florida; Boston, Massachusetts, and Richmond, Virginia N80-20765
CERAMIC COATINGS
Study program to develop and evaluate die and container materials for the growth of silicon ribbons --- for development of low cost solar cells
[NASA-CR-162899] N80-20818
CERAMICS
Composite wall concept for high temperature turbine shrouds: Survey of low modulus strain isolator materials
[NASA-TM-81443] N80-20398
The Science of Ceramic Machining and Surface Finishing 2 --- conferences
[PB80-110133] N80-20441
Inorganic spark chamber frame and method of making the same
[NASA-CASE-GSC-12354-1] N80-20565
CHANNELS (DATA TRANSMISSION)
Experimental Image Compression Subsystem (EICS) communication testing
[AD-A077546] N80-20470
CHARGE COUPLED DEVICES
Signal processing circuit development
[AD-A079053] N80-20465
CHECKOUT
Minicomputer controlled system for testing telemetry receiving and recording systems
[AD-A078803] N80-20305
CHEMICAL ANALYSIS
Time resolved analysis of fluorescent metal chelates N80-20336
Selected ion fragmentation with a triple quadrupole mass spectrometer N80-20337
A chromatograph injection valve, an apparatus for rapid insertion of miniature glass samplers into the carrier gas flow of a gas chromatograph
[AD-A079882] N80-20345
Determination of selected anions in water by ion chromatography
[PB80-111941] N80-20356
Pressure sintering and creep deformation: A joint modeling approach
[COO-2408-6] N80-20388
Trace and minor element analyses of coal liquefaction products
[PETC/TR-79/3] N80-20417
Assessment of low- to moderate-temperature geothermal resources of Nevada
[NVO-01556-1] N80-20792
Trace characterization of metals in solid samples and air pollutants N80-20918
Interpretation of environmental assessment data
[PB80-108160] N80-20933
CHEMICAL BONDS
Molecular orbital criteria for reductive elimination from organotransition-metal complexes
[AD-A079447] N80-20344
CHEMICAL FRACTIONATION
Chemistry research and development --- americium and plutonium recovery and purification
[RFP-2952] N80-20309
CHEMICAL REACTIONS
Structural assessment of involutes
[AD-A077875] N80-20318
Vapor pressure and melting behavior of sulfuric acid-water systems
[PB80-116007] N80-20363
Basic research in engineering: Fluid dynamics and thermal processes --- workshop
[FE-2468-54] N80-20551
Additional reversal characteristics of sealed nickel cadmium cells N80-20848
Reversal of nickel cadmium cells --- chemical reactions N80-20849
Structure reactivity correlations for environmental reactions
[PB80-110323] N80-20934
Bifurcations of a model diffusion-reaction
[AD-A079725] N80-21071
CHEMICAL REACTORS
Thermal reactor and process --- liquid silicon production from silane
[NASA-CASE-NPO-14369-1] N80-20338
Processing research on chemically vapor deposited silicon nitride --- for electromagnetic windows in chemical reactors
[AD-A079328] N80-20349
Design of photochemical reaction chamber --- to study exhaust gases from coal fired power plants
[PB80-100654] N80-20360
Production of aluminum-silicon alloy and ferrosilicon and commercial purity aluminum by the direct reduction process, phase B
[CONS/5089-7] N80-20382

Liquid phase methanation/shift pilot plant operation and laboratory support work
[FE-2036-37] N80-20413
Coal liquefaction test center
[FE-1517-78] N80-20425

CHEMILUMINESCENCE
A study by optical spectroscopy of chemiluminescent reactions between ions and molecules for N(+)+NO yields N2(+)* +O
[MPIS-4/1979] N80-21126

CHESAPEAKE BAY (US)
Decline of submerged aquatic plants in Chesapeake Bay
[PB80-114747] N80-21009

CHINESE PEOPLES REPUBLIC
Earth Survey Applications Division: Research leading to the effective use of space technology in applications relating to the Earth's surface and interior
[E80-10084] N80-20722

CHLORINE
N-type molybdenum diselenide-based liquid junction solar cells: A non-aqueous electrolyte system employing the chlorine/chloride couple
[AD-A079712] N80-20871

CHLOROPHYLLS
Spectra of isolated vegetational constituents N80-20779
A spectral method for determining the percentage of green herbage material in clipped samples N80-20780
Evaluation of a spectral method for percentage green determination using clipped rangeland forage samples --- Texas N80-20781
Airborne laser fluorosensing of surface water chlorophyll a --- Lake Mead, Nevada
[PB80-113400] N80-20797

CHROMATOGRAPHY
Determination of selected anions in water by ion chromatography
[PB80-111941] N80-20356

CHROMIUM
Reliability of energy dispersive X-ray fluorescence analysis of low-alloy steels
[AD-A077154] N80-20371
Black chrome outgassing study
[UCRL-82797] N80-20389
Production of thin film networks which utilize chrome-gold conductors
[BDX-613-2257] N80-20503
Compensation mechanisms in GaAs. Study of chrome and oxygen in this material and their influence in obtaining semi-insulating GaAs
[LEP-79/640.SME-645-C] N80-21182

CHROMOSPHERE
Analysis of time dependent phenomena observed with the LPSP OSO-8 instrument --- solar chromosphere and photosphere
[NASA-CR-162908] N80-21237

CIRCUIT BOARDS
A normal yoke for the determination of the magnetic characteristics of electrical sheets
[BLL-RTS-11946] N80-20481

CIRCUIT DIAGRAMS
Placement and routing algorithms for hierarchical integrated circuit layout N80-20486

CIRCULAR CYLINDERS
Fluctuating response of circular cylinders in small groups in fluid flow: Discussion and guide to data available
[ESDU-79025] N80-20510
Fluid flow through a partially filled cylinder --- laminar flow N80-20516

CIRCULAR PLATES
On wings of circular design
[NASA-TM-75505] N80-20229

CITIES
NASA-census Application Pilot Test (APT) and urban area delineation studies --- Seattle, Washington; Austin, Texas; Orlando, Florida; Boston, Massachusetts, and Richmond, Virginia N80-20765
The impact of future diesel emissions on the air quality of large cities
[PB80-113857] N80-20947
Priority R and D needs of urban America, resource document
[PB80-106164] N80-21215

CLEANING
ISS/SIMS characterization of UV/O sub 3 cleaned surfaces
[AD-A078425] N80-20375

CLEANLINESS
Spacecraft test chamber contamination study in the AEDC Mark 1 facility
[AD-A079638] N80-20296

CLIMATOLOGY
International scientific interest in the question of CO2 induced climate change
[UCID-18332] N80-20985
Inferred climatology for U.S. airports
[AD-A080487] N80-20987
A test of the climatic normality of synthetic profiles of atmospheric liquid water content over the USSR in 1973
[AD-A077021] N80-20990
US Navy and Marine Corps Meteorological station climatic summaries
[AD-A076976] N80-20991

CLOCKS
The Exxon rechargeable cells --- solar rechargeable clocks N80-20834

CLOUD COVER
Sources of variations in LANDSAT autocorrelation --- Richmond, Virginia and Denver, Colorado N80-20767

CLOUD PHYSICS
The present status of atmospheric electricity, report of the USRA atmospheric electricity study panel
[PB80-111479] N80-20979

CLOUD SEEDING
The economic effects of weather modification activities. Part 2: Range production and interindustry analysis
[PB80-112055] N80-21006

CLUMPS
Role of cluster size and surface on phase transitions N80-20331
Probabilistic method for grouping data
[ORNL/CSD/TM-65] N80-21095

COAL
Combustion of methanol coal slurries in Hartmann resonator
[FE-2744-T2] N80-20351
Experimental laboratory measurement of thermophysical properties of selected coal types
[NASA-CR-162913] N80-20404
Refining and upgrading of synfuels from coal and oil shales by advanced catalytic processes
[FE-2315-37] N80-20407
Support studies in fluidized-bed combustion 1978 annual report
[PB80-112758] N80-20430
Surface mine monitoring --- Pennsylvania N80-20764
Computer processing of multispectral scanner data over coal strip mines
[PB80-111677] N80-20803
Environmental development plan: Coal extraction and preparation
[DOE/EDP-0050] N80-20921

COAL GASIFICATION
Liquid phase methanation/shift pilot plant operation and laboratory support work
[FE-2036-37] N80-20413
Advanced development of a short-residence-time hydrogasifier
[FE-3125-5] N80-20414
Chemical and physical stability of refractories for use in coal gasification
[COO-2904-14] N80-20429
Coal-conversion technologies: Some health and environmental effects
[BNL-5103] N80-20930
Control technologies for particulate and tar emissions from coal converters
[PB80-108392] N80-20949
Hot gas cleanup process
[PB80-108467] N80-20950

COAL LIQUEFACTION
Coal liquefaction with synthesis gas
[PETC/TR-79/1] N80-20416
Trace and minor element analyses of coal liquefaction products
[PETC/TR-79/3] N80-20417
Exploratory studies in catalytic coal liquefaction
[EPRI-AF-1184] N80-20422
Catalyst characterization in coal liquefaction
[SAND-79-1969] N80-20423
Coal liquefaction test center
[FE-1517-78] N80-20425
Zinc halide hydrocracking process for distillate fuels from coal
[FE-1743-68] N80-20426
Coal-conversion technologies: Some health and environmental effects
[BNL-5103] N80-20930

COAL UTILIZATION
Photochemical conversion of coal to gasoline in an entrained bed reactor
[ORO-5020-T1] N80-20415
Factors affecting cleanup of exhaust gases from a pressurized, fluidized-bed coal combustor
[NASA-TM-81439] N80-20532
How to burn coal efficiently and economically, and meet air pollution requirements: The fluidized-bed combustion process
[PB80-107501] N80-20911
Coal-conversion technologies: Some health and environmental effects
[BNL-5103] N80-20930

COASTAL CURRENTS
Delaware sea grant college program
[PB80-122401] N80-21011

COASTS
Gravity model development N80-20748
Meteorological criteria for standard project hurricane and probable maximum hurricane windfields, gulf and east coasts of the United States
[PB80-117997] N80-20999
National winter storms operations plan
[PB80-118425] N80-21000

COAXIAL CABLES
Multiple property variations in coaxial cylindrical conductors determined with multiple-frequency eddy currents
[NUREG-CR-0967] N80-20505

COBALT
Exploratory studies in catalytic coal liquefaction
[EPRI-AF 1184] N80-20422
Catalyst characterization in coal liquefaction
[SAND-79-1969] N80-20423

COCKPIT SIMULATORS
Development and evaluation of a general aviation real world noise simulator
[NASA-CR-159237] N80-21100

CODING
Some aspects of block quantization with applications to source coding and digital holography N80-20562
Source coding with side information and universal coding
[PB80-108343] N80-21195

COGENERATION
Feasibility of cogeneration application of a 4.8 MW fuel cell power plant at a Santa Clara, California paper mill
[SAN-2189-T1] N80-20876

COLLISION AVOIDANCE
Development of a bird/aircraft strike hazard assessment methodology
[AD-A075584] N80-20246
Collision avoidance radar braking systems investigation, phase 3 study
[PB80-108939] N80-21218

COLLISION PARAMETERS
Determination of molecular-ion structures through studies of the collisionally-induced dissociation of fast (MeV) molecular ions
[CONF-790843-10] N80-21116

COLLISIONAL PLASMAS
Collisional effects on electrostatic waves in isotropic plasmas N80-21150
Numerical study of current-driven collisional drift and alfven instabilities in a sheared magnetic field
[IPPJ-436] N80-21157

COLLISIONLESS PLASMAS
Stability analysis of cylindrical Vlasov equilibria N80-21152

COLOR
Development of a color alphanumeric liquid crystal display --- suitable for aircraft command and control
[AD-A079289] N80-20266
ADP-supported color separation N80-20684

COLOR PHOTOGRAPHY
Production of color composites form multispectral data records N80-20712

COLORADO
Earth Survey Applications Division: Research leading to the effective use of space technology in applications relating to the Earth's surface and interior
[E80-10084] N80-20722
Geological/geophysical resource assessment --- Rio Grande rift N80-20725
NASA-census Application Pilot Test (APT) and urban area delineation studies --- Seattle, Washington; Austin, Texas; Orlando, Florida; Boston, Massachusetts, and Richmond, Virginia N80-20765
Sources of variations in LANDSAT autocorrelation --- Richmond, Virginia and Denver, Colorado N80-20767
Monitoring drought in Colorado with LANDSAT MSS N80-20770
Energy source book --- Colorado, Montana, North Dakota, South Dakota, Utah, and Wyoming
[DOE/TIC-10190] N80-20895

COLUMBIA RIVER BASIN (ID-OR-WA)
Strontium isotopic and trace element geochemistry of the Saddle Mountains and Grande Ronde Basalts of the Columbia River Basalt group N80-20958

COLUMNS (SUPPORTS)
Column buckling of isotropic and composite beams using a truncated Fourier series
[AD-A079862] N80-20629

COMBINATORIAL ANALYSIS
Combinatorial problems of applied discrete mathematics
[AD-A079521] N80-21075

COMBUSTIBLE FLOW
Development of combustion diagnostics and applications to turbulent combustion
[AD-A079523] N80-20348
Development of combustion data to utilize low-Btu gases as industrial process fuels, project 61004. Special report no. 7: Premix tunnel burner
[FE-2489-41] N80-20418

COMBUSTION
On flame spread mechanism over combustible solid surface
[BLL-RTS-12027] N80-20327
Combustion and operating characteristics of spark-ignition engines
[NASA-CR-162896] N80-20340
Atomic and molecular gas phase spectrometry
[AD-A079657] N80-20350
Flame propagation, autoignition and combustion in alcohol-petroleum-air mixtures and other alternative fuels
[COO-4486-5] N80-20420

COMBUSTION CHAMBERS
Development of combustion data to utilize low-Btu gases as industrial process fuels, project 61004. Special report no. 7: Premix tunnel burner
[FE-2489-41] N80-20418
Factors affecting cleanup of exhaust gases from a pressurized, fluidized-bed coal combustor
[NASA-TM-81439] N80-20532

COMBUSTION EFFICIENCY
Combustion of methanol coal slurries in Hartmann resonator
[FE-2744-T2] N80-20351
Evaluation of fuel character effects on the F101 engine combustion system
[AD-A077860] N80-20405
Support studies in fluidized-bed combustion 1978 annual report
[PB80-112758] N80-20430

COMBUSTION PHYSICS
Detailed modeling of diesel combustion
[CONF-7709196-1] N80-20352
Chemical kinetic modeling for combustion applications
[UCRL-81777] N80-20353

COMBUSTION PRODUCTS
Application of Raman diagnostics to combustion
[NASA-CR-162901] N80-20339
Evaluation of sensitized fluorescence for polynuclear aromatic hydrocarbon detection --- in combustion products
[PB80-108475] N80-20358
Pollutant formation in flat laminar opposed jet diffusion flames N80-20919

COMBUSTION STABILITY
The structure of eddies in turbulent flames, volume 1
[AD-A078625] N80-20341

COMETS
On the production of long-period comets by stellar perturbations of the Oort comet clouds --- calculation of orbital perturbation of comets around the Sun due to passing stars N80-21231
Outer satellite atmospheres: Their extended nature and planetary interactions --- sodium cloud of Io, hydrogen torus of Titan, and comet atmospheres
[NASA-CR-162902] N80-21235

COMMAND AND CONTROL
The Art of Communications Interfaces; technology insertion in the C3I arena: Proceedings of the 4th Annual Seminar
[AD-A078344] N80-20471

COMMAND GUIDANCE
Sources of tracking error in millimeter wavelength missile guidance systems
[AD-A078226] N80-20298

COMMERCIAL AIRCRAFT
The vulnerability of commercial aircraft avionics to carbon fibers
[NASA-CR-159213] N80-20317

COMMODITIES
Perlite: Mineral commodity profiles
[PB80-111362] N80-20359
Molybdenum: Mineral commodity profiles
[PB80-110885] N80-20392
Lithium Mineral commodity profiles
[PB80-123011] N80-20799

COMMUNICATION EQUIPMENT
The Art of Communications Interfaces; technology insertion in the C3I arena: Proceedings of the 4th Annual Seminar
[AD-A078344] N80-20471

COMMUNICATION NETWORKS
Biomedical communications experiments. Using the communications technology satellite: Technical evaluation
[PB80-111016] N80-20476

COMMUNICATION SATELLITES
A note on almost noiseless channels
[AD-A077588] N80-20473
NATO: In-orbit experience N80-20836
RCA Satcom: In-orbit experience N80-20837

COMMUNICATION THEORY
Combinatorial problems of applied discrete mathematics
[AD-A079521] N80-21075

COMMUNICATIONS TECHNOLOGY SATELLITE
Biomedical communications experiments. Using the communications technology satellite: Technical evaluation
[PB80-111016] N80-20476

COMPARATORS
The future of analytical evaluation equipment --- image measurement techniques N80-20670
Airport obstacle maps N80-20673

COMPLEX SYSTEMS
Bounding the reliability of multistate systems
[AD-A075579] N80-20602

COMPOSITE MATERIALS
Aerothermal evaluation of high-temperature structural materials for use in high-performance missile design
[AD-A080023] N80-20319
Prediction and verification of moisture effects on carbon fiber-epoxy composites
[AD-A079557] N80-20320
Investigation of in situ composites for electromagnetic device applications with emphasis on development of microwave tube cathodes and high resolution displays
[AD-A079698] N80-20321
Advanced composites: Design and application. Proceedings of the meeting of the Mechanical Failures Prevention Group
[NASA-CR-162864] N80-20325
Research and development on a spiral-wound membrane system for single-stage seawater desalination
[PB80-114705] N80-20357
Wave propagation in three-dimensional inelastic media
[AD-A080081] N80-20468
Measurement of electrical conductivity in carbon/epoxy composite material over the frequency range 75 MHz to 2.0 GHz
[AD-A078008] N80-20489
Fabrication of superconducting wire composites by directional solidification
[IS-4698] N80-20501
Column buckling of isotropic and composite beams using a truncated Fourier series
[AD-A079862] N80-20629

COMPOSITE PROPELLANTS
Experimental and analytical study of erosive burning of solid propellants
[AD-A079618] N80-20409

COMPOSITE STRUCTURES
Design, fabrication and test of graphite/polyimide composite joints and attachments for advanced aerospace vehicles
[NASA-CR-159110] N80-20316
Advanced composites: Design and application. Proceedings of the meeting of the Mechanical Failures Prevention Group
[NASA-CR-162864] N80-20325
Composite wall concept for high temperature turbine shrouds: Survey of low modulus strain isolator materials
[NASA-TM-81443] N80-20398

COMPRESSED AIR
Economics of thermal energy storage for compressed air energy storage systems
[PNL-SA-7949] N80-20903
Economics of compressed air energy storage employing thermal energy storage
[PNL-3191] N80-20904

COMPRESSIBLE FLOW
Computation of axisymmetric separated nozzle-afterbody flow --- computer program for solving compressible nozzle flow using navierstokes equation
[AD-A079694] N80-20238
Progress in turbulence modeling for complex flow fields including effects of compressibility
[NASA-TP-1517] N80-20527
Stability of self-similar flow: Uniform implosion of an ablatively driven shell
[AD-A079890] N80-20540

COMPRESSION LOADS
Design of helical compression springs
[AD-A077113] N80-20593

COMPRESSION TESTS
Transverse compressive testing of thick Kevlar/epoxy laminates
[SAND-79-0176] N80-20322

COMPUTATIONAL FLUID DYNAMICS
Introduction to computational techniques for boundary layers
[SAND-79-0893] N80-20550

COMPUTER COMPONENTS
Computer circuit card puller
[NASA-CASE-FRC-11042-1] N80-20589
Remote system software --- for a digital seismic data system
[UCID-18191] N80-20791

COMPUTER GRAPHICS
Development, status, and goals of cartographic automation N80-20655
Automatic acquisition and processing of cartographic data N80-20656
Reports on cartography and topographical measurements. Series 2: Translations --- computer assisted data correlation
[REPT-35] N80-20679
A program for the fully automated displacement of point and line features in cartographic generalization N80-20680
A digital terrain model for large surfaces and direct storage access N80-20681
Locational characteristics and the sequence of computer assisted processes of cartographic generalization N80-20685
Computer-assisted thematic mapping for federal planning N80-20686
Digitizing of geometic data for thematic mapping: State-of-the-art and future developments N80-20687
Map projection change: Some programs for the transformation of the contents of available maps according to different map projections N80-20690
Interactive aids for cartography and photo interpretation
[AD-A079553] N80-20789
Experiments in digitizing line structures by a raster scan process
[GMD-MITT-37] N80-20793

Determination of lines and nodes from images
[GMD-MITT-44] N80-20794
Region representation raster-to-quadtree conversion
[AD-A078086] N80-21046
Syndia users guide
[AD-A075538] N80-21047
Shape segmentation using relaxation
[AD-A078084] N80-21060
Computing perimeters of images represented by quadtrees
[AD-A078083] N80-21061

COMPUTER NETWORKS
Design and performance of local computer networks N80-21049

COMPUTER PROGRAMMING
Rotocraft flight simulation, computer program C81. Volume 3: Programmer's manual
[AD-A077345] N80-20262
Computer based generalization for the elaboration and extension of topographic maps N80-20658
Bathymetric data reduction subsystem
[AD-A079624] N80-21008
Microcomputers: General applications, part 1, volume 4. Citations from the Engineering Index data base
[NTIS/PS-79/0726/4] N80-21041
ISIS users manual
[NASA-TM-80144] N80-21043
Workshop on Real-Time Programming for NASA Flight Project
[NASA-TM-80236] N80-21045

COMPUTER PROGRAMS
Computation of axisymmetric separated nozzle-afterbody flow --- computer program for solving compressible nozzle flow using navierstokes equation
[AD-A079694] N80-20238
An operating and support cost model for avionics automatic test equipment --- f-16 aircraft
[AD-A075586] N80-20269
Real-time data reduction capabilities at the Langley 7 by 10 foot high speed tunnel
[NASA-TM-78801] N80-20286
Coding, testing and documentation of processors for the flight design system
[NASA-CR-160552] N80-20289
AFSIM, an Air Force sattellite interactions model
[AD-A078032] N80-20300
Frame C: A compact procedure for quantitative energy-dispersive electron probe X-ray analysis
[PB80-110307] N80-20570
A program for the fully automated displacement of point and line features in cartographic generalization N80-20680
The RGST chain program for the determination of potential coefficients and station coordinates N80-20702
Geodyn program systems development N80-20747
PLASTIC CANOPY: A computer program for the structural analysis of protective canopies
[PB80-122724] N80-20798
Computer manual for calculating wave-height distributions about offshore structures
[PB80-109150] N80-21013
Adaptation and optimization of a line-by-line radiative transfer program for the STAR-100 (STARSMART)
[NASA-CR-159238] N80-21044
Syndia users guide
[AD-A075538] N80-21047
Documentation of a computer program for Hilliers heuristic procedure in integer linear programming
[AD-A075576] N80-21048
Description of data entry for automated cost estimating
[K/CSD/TM-29-REV-1] N80-21196
Urban mass transportation energy conservation: SRGP operating instructions and program documentation, volume 5
[DOE/PE/8628-1-VOL-5] N80-21205

COMPUTER SYSTEMS DESIGN
Design and performance of local computer networks N80-21049

COMPUTER SYSTEMS PROGRAMS
ANSR-2: Analysis of nonlinear structural response, user's manual
[PB80-113301] N80-20440
Remote system software --- for a digital seismic data system
[UCID-18191] N80-20791
Guidelines for evaluation of minicomputer hardware and software: A users perspective
[AD-A078460] N80-21039
ISIS users manual
[NASA-TM-80144] N80-21043
Description of the Wharton/ODA system
[AD-A079601] N80-21191

COMPUTER TECHNIQUES
The data bank in the cartographic automation system N80-20660

COMPUTERIZED DESIGN
Placement and routing algorithms for hierarchical integrated circuit layout N80-20486
Development of numerical techniques and computer systems for design, analysis and fabrication of interdigital transducers as surface acoustic wave devices
[AD-A079623] N80-20493
Optimization of horizontal control networks by nonlinear programming
[PB80-117948] N80-20976
Automated synthesis of digital hardware modules: Simulation and verification of interconnections
[AD-A078463] N80-21038

COMPUTERIZED SIMULATION
Development of wind shear models and determination of wind shear hazards
[AD-A080588] N80-20243
Computer modeling of terrain effects on Instrument Landing System (ILS) glide slope systems
[AD-A078228] N80-20252
Adaptive estimation of information values in continuous decision making and control of advanced aircraft
[AD-A077917] N80-20281
Computer simulation of the martensite transformation in a model two-dimensional body
[LBL-9346] N80-20383
Solution of the equations of convective heat, mass, and momentum transfer by the finite-element method using quadrilateral elements N80-20515
Computer simulation of a solar energy system which utilizes flat-plate collectors
[AD-A079906] N80-20870
Wind Energy System Time-domain (WEST) analyzers using hybrid simulation techniques
[NASA-CR-159737] N80-20909
Validation of the Dairchem code 1: Quiet midlatitude conditions
[AD-A077880] N80-20965
Preliminary report of numerical simulation of intermediate wavelength collisional Rayleigh-Taylor instability in equatorial spread F
[AD-A079307] N80-20969

CONCAVITY
Determination of forces on arbitrary concave bodies in high speed rarefied gases
[LOG-J11513] N80-20530

CONCENTRATION (COMPOSITION)
Effect of space flight on sodium, copper, manganese and magnesium content in the skeletal bones
[NASA-TM-75506] N80-21025

CONCENTRATORS
Installation and startup of the fixed mirror solar concentrator collector field subsystem
[GA-A-15344] N80-20888
Optical analysis and optimization of line focus collectors
[SERI/TR-34-092] N80-20893

CONCRETES
Seismic design of reinforced concrete buildings: An inelastic response spectrum approach --- earthquake resistant structures beams (supports) N80-20433
Pavement recycling-bituminous concrete and concrete mix designs
[PB80-106263] N80-20443
Use of Glass Reinforced Concrete (GRCD) as a substrate for photovoltaic modules
[NASA-CR-162898] N80-20819
Acoustic emission monitoring of steel and concrete structural elements with particular reference to primary nuclear containment structures
[CONF-790966-1] N80-21105

CONDUCTORS
Production of thin film networks which utilize chrome-gold conductors
[BDX-613-2257] N80-20503

CONFERENCES
Advanced composites: Design and application. Proceedings of the meeting of the Mechanical Failures Prevention Group
[NASA-CR-162864] N80-20325
The Science of Ceramic Machining and Surface Finishing 2 --- conferences
[PB80-110133] N80-20441
The Art of Communications Interfaces; technology insertion in the C3I arena: Proceedings of the 4th Annual Seminar
[AD-A078344] N80-20471
Basic research in engineering: Fluid dynamics and thermal processes --- workshop
[FE-2468-54] N80-20551
International symposium on urban hydrology: Proceedings of two special sessions, spring annual meeting, American Geophysical Union
[PB80-123078] N80-20805
The 1979 Goddard Space Flight Center Battery Workshop
[NASA-CP-2117] N80-20820
Fifth Working Conference (Space Biology) at the 21st Plenary Session of COSPAR
[NASA-TM-76107] N80-21017
Physics with fast molecular-ion beams
[ANL/PHY-79-3] N80-21115
Proceedings of USSR-Japan Joint Seminar on Plasma Diagnostics
[IPPJ-438] N80-21154

CONGRESSIONAL REPORTS
Patent policy, part 2
[GPO-58-551] N80-21199

CONICAL BODIES
Real-gas effects on the aerodynamics of blunt cones as measured in a hypervelocity range
[AD-A075526] N80-20241
Basic research in three-dimensional imaging from transient radar scattering signatures
[AD-A079423] N80-20462

CONSERVATION
Technical options for conservation of metals: Case studies of selected metals and products
[PB80-102619] N80-20393

CONSOLIDATION
Analysis of the consolidation of layered soils using the method of lines
[PB80-112766] N80-20447

CONTAINERLESS MELTS
Ultrapure glass optical waveguide development in microgravity by the sol-gel process
[NASA-CR-162910] N80-21142

CONTAMINANTS
Spacecraft test chamber contamination study in the AEDC Mark 1 facility
[AD-A079638] N80-20296
Indicatory fate study
[PB80-102809] N80-20942

CONTAMINATION
Nickel contaminated titanium weld wire study
[LTR-141-93] N80-20381

CONTINENTAL SHELVES
Marine geology and tectonic evolution of the northwestern margin of the California continental borderland N80-20959

CONTROL SURFACES
Transonic unsteady airloads on an energy efficient transport wing with oscillating control surfaces
[NASA-TM-81788] N80-20228
An approximate analysis of wing unsteady aerodynamics
[AD-A079322] N80-20239

CONTROL THEORY
Asymptotic eigenstructures
[NASA-CR-162900] N80-21050
Closed-loop eigenvalue specification for infinite dimensional systems augmented and deficient hyperbolic cases
[AD-A079727] N80-21053

CONTROLLABILITY
Preliminary airworthiness evalaution, AH-1G with the airborne target acquisition fire control system and the hellfire modular missile system installed
[AD-A078340] N80-20265

CONVECTION
Interferometric study of the natural convection characteristics of flat plate, slat and vee-corrugated solar collectors
[COO-2971-6] N80-20900

CONVECTION CURRENTS
Global intra-plate volcanism N80-20744
CONVECTIVE FLOW
The gravity field in the central pacific from satellite-to-satellite tracking and implications for mantle convection N80-20750
Mantle convection and subcrustal stress N80-20752
Information theory density distribution --- Earth Mantle N80-20753
CONVECTIVE HEAT TRANSFER
Two-dimensional, laminar, mixed (forced and free) convection, radiative diffusion flames N80-20333
Solution of the equations of convective heat, mass, and momentum transfer by the finite-element method using quadrilateral elements N80-20515
COOLING
Distribution of steady state temperatures and thermoelastic stresses in cylindrical shell with internal heat generation and cooled on both sides or only on one side
[GA-A-15509] N80-20634
Thermal energy storage application areas --- for building heating and cooling
[CONS/5113-T4] N80-20894
COOLING SYSTEMS
Heat-pump-centered integrated community energy systems: System development
[ANL/CNSV-TM-8] N80-20880
Comprehensive study of drift from mechanical draft cooling towers
[PNL-3083] N80-20928
COORDINATE TRANSFORMATIONS
Complete supersonic flowfields over blunt bodies in a generalized orthogonal coordinate system
[NASA-TM-81784] N80-20529
Map projection change: Some programs for the transformation of the contents of available maps according to different map projections N80-20690
COORDINATES
Three-dimensional laminar solution of the Navier-Stokes equations using body-filtered coordinate systems, part 2
[AD-A080046] N80-20543
Setting data from multistage analytical orientation N80-20709
COPOLYMERS
Synthesis, characterization, and properties of isoprene-methyl methacrylate copolymers N80-20395
COPPER
Resource and energy constraints of regional and global availability of aluminum copper, and iron 1975 - 2000: A computer study N80-20720
Effect of space flight on sodium, copper, manganese and magnesium content in the skeletal bones
[NASA-TM-75506] N80-21025
COPPER SELENIDES
Emerging materials systems for solar cell applications Cu(2-x)Se
[DOE/ET-23005/T1] N80-20872
CORN
Monitoring drought in Colorado with LANDSAT MSS N80-20770
Relative sensitivity of fifteen spectral bands to changes in soybean canopy cover for wet and dry soils N80-20776
Thematic mapper versus multispectral scanner for crop monitoring N80-20778
CORRELATION
On correlation parameters for some binary sequences of lengths 31 and 63 for spread-spectrum multiple-access communications
[AD-A077152] N80-20464
CORRELATION DETECTION
An acquisition aid for a phase locked loop --- using an iterative technique N80-20485
CORROSION
Application of inelastic electron tunneling spectroscopy to the study of inhibition of aluminum corrosion N80-20367
CORROSION RESISTANCE
Testing the corrosion protection properties of coatings by means of pulsed direct current
[BLL-RTS-11872] N80-20366
Corrosion resistance of zinc-level plated U-0.75 Ti
[AD-A075539] N80-20373
Chemical and physical stability of refractories for use in coal gasification
[COO-2904-14] N80-20429
COSMIC RAYS
Superconducting magnet system for the SPIRIT cosmic ray space telescope
[LBL-9999] N80-21225
COST ANALYSIS
A study of two avionics life cycle cost models and their applicability
[AD-A076981] N80-20268
Description of data entry for automated cost estimating
[K/CSD/TM-29-REV-1] N80-21196
COST ESTIMATES
Application of Bayesian approach to updating air frame CERs
[AD-A077064] N80-21064
Description of data entry for automated cost estimating
[K/CSD/TM-29-REV-1] N80-21196
COTTON
Plant stress and relationships to spectral responses --- cotton and tomato plants N80-20769
CRACK PROPAGATION
Stress corrosion environmental effects on AF 1410 --- aircraft construction materials
[AD-A078598] N80-20374
Fatigue crack propagation in Hastelloy X weld metal
[ORNL/TM-6999] N80-20386
Measurement of transient response of a central crack to a tensile pulse N80-20609
Finite-element analysis of problems involving stress singularities --- including lap joints and elastic crack problems N80-20610
Energy release rate calculations for interface edge cracks based on a conservation integral
[AD-A079723] N80-20626
Materials and mechanics of rate effects in brittle fracture --- cantilever beams and steels
[COO-2422-22] N80-20635
CRACKS
Fracture mechanics of bi-material interface cracks --- the behavior of a metallic interface cracks N80-20611
Singular finite element shape functions in estimating stress intensity factors N80-20618
CRATERS
Impact craters from centimeters to megameters N80-21233
CREEP ANALYSIS
An evaluation of four current models to predict the creep-fatigue interaction in rene 95
[AD-A077168] N80-20623
CREEP DIAGRAMS
Pressure sintering and creep deformation: A joint modeling approach
[COO-2408-6] N80-20388
CRITICAL POINT
Vapour pressures and critical points of liquids. 14: Aliphatic oxygen-nitrogen compounds
[ESDU-79030] N80-20329
CROP GROWTH
Plant stress and relationships to spectral responses --- cotton and tomato plants N80-20769
Off-nadir viewing effects on spectral assessment of green biomass N80-20772
Thematic mapper versus multispectral scanner for crop monitoring N80-20778
The economic effects of weather modification activities. Part 1: Crop production
[PB80-112048] N80-21005
CROP INVENTORIES
Monitoring drought in Colorado with LANDSAT MSS N80-20770
Assessing soybean leaf area and leaf biomass by spectral measurements --- Beltsville, Maryland Agricultural Research Center N80-20775
CROP VIGOR
Monitoring drought in Colorado with LANDSAT MSS N80-20770
Radiometric resolution for monitoring vegetation: How many bits are needed? N80-20777
CROSS COUPLING
Aircraft motion sensitivity to dynamic stability derivatives --- motion simulation studies using cross coupling derivatives on fighter/ bomber aircraft
[AD-A079421] N80-20283
CROSS FLOW
Fluid mechanics, internal flow sub-series. Volume 7: A guide to fan selection and performance
[ESDU-79037] N80-20511
CROSSED FIELD GUNS
Impact fusion with a segmented rail gun
[AD-A079811] N80-20307
CRUDE OIL
Analysis of current trends in U.S. petroleum and natural gas production
[PB80-116056] N80-20800
Analysis of water resources requirement for the enhanced (tertiary) oil recovery in the southern plains region of the United States
[PB80-110869] N80-20801
CRUSTAL FRACTURES
On the slection of station sites for observing strain steps and earthquake forerunners in California N80-20740
Earthquake and crustal deformation studies --- San Francisco and Fort Ross, California N80-20743
CRYOGENIC EQUIPMENT
Evaluation of some cryogenic sensors and instrumentations for a large superconducting MHD magnet
[CONF-790815-30] N80-20568
CRYOGENIC FLUID STORAGE
LeRC reduced gravity fluid management technology program
[NASA-TM-81450] N80-20304
CRYOGENIC ROCKET PROPELLANTS
LeRC reduced gravity fluid management technology program
[NASA-TM-81450] N80-20304
CRYOTRAPPING
Atomic hydrogen storage --- cryotrapping and magnetic field strength
[NASA-CASE-LEW-12081-2] N80-20402
CRYSTAL DISLOCATIONS
Grain-boundary diffusion: Structural effects, models and mechanisms
[CONF-7909100-1] N80-20387
CRYSTAL GROWTH
Large area silicon sheet by EFG
[NASA-CR-162907] N80-20816
Mathematical models of some controlled crystallization process
[BLL-RTS-12032] N80-21168
CRYSTAL LATTICES
The effect of plastic deformation on the transport of hydrogen in nickel
[AD-A077660] N80-20391
Phase transitions in lattice gauge theories N80-21172
CRYSTAL STRUCTURE
Effects of surface structure on secondary electron emission N80-21170
Study of Raman linewidths as a function of structure, bonding and temperature N80-21171
Roles of crystal fields in magnetic superconducting rare-earth rhodium bondes
[LA-UR-79-3174] N80-21175
Energy of 100 coincidence twist boundaries in transition metal oxides
[CONF-7907101-2] N80-21179
Standard X-ray diffraction powder patterns. Section 16: Data for 86 substances
[PB80-110364] N80-21183
CRYSTALLINITY
Mechanical properties of crystalline solids --- transient deformation, grain boundary, sliding, and grain boundary cavitation processes in Zircaloys
[COO-2172-29] N80-21180
CRYSTALLIZATION
Crystallization and irradiation effects in an amorphous alloy of type Fe40Ni38Mo4B18
[PNL-TR-372] N80-20390
Crystallization and metasomatism of the Cuchillo Mountain laccolith, Sierra County, New Mexico N80-20957
Mathematical models of some controlled crystallization process
[BLL-RTS-12032] N80-21168
CRYSTALLOGRAPHY
Analytical electron microscope study of the omega phase transformation in a zirconium-niobium alloy
[COO-1198-1279] N80-20385

CURVE FITTING
Information relative to cartography and geodesy. Series 2: Translations
[REPT-37] N80-20714
On orbital fitting with altimeter data N80-20715
General least-squares fitting procedures to minimize the volume of a hyperellipsoid
[LA-8096-MS] N80-21081

CYCLIC LOADS
On the theory of cyclic viscoplasticity --- stress-strain response N80-20608

CYLINDRICAL BODIES
Oscillating flow about tube bundles
[AD-A078269] N80-20534
Numerical solution of the two-dimensional incompressible averaged Navier-Stokes equations for finite arbitrary shaped isolated bodies, part 1
[AD-A080093] N80-20544
A diagonally dominant solution for the cylinder end problem and a non-axisymmetric elasticity solution for a truncated spherical dome N80-20612
Thermo-elastic-plastic stresses in hollow cylinders due to quenching
[AD-A077109] N80-20622
Analytical/experimental investigation of the instability of composite cylindrical panels
[AD-A079850] N80-20628
Experimental study of cap and thickness influence on the vibration response and damping of flexible fluid-coupled coaxial cylinders
[CONF-790515-14] N80-20633

CYLINDRICAL SHELLS
Distribution of steady state temperatures and thermoelastic stresses in cylindrical shell with internal heat generation and cooled on both sides or only on one side
[GA-A-15509] N80-20634
Dynamic buckling of a rigid-plastic cylindrical shell: A second order differential equation subject to four boundary conditions
[COO-4122-29] N80-20636
Extension of the Vaughan-Florence analysis of dynamic buckling of a rigid-plastic cylindrical shell
[COO-4122-28] N80-20637

D

D REGION
Validation of the Dairchem code 1: Quiet midlatitude conditions
[AD-A077880] N80-20985

DAMAGE
X-ray analysis of accrued damage in stress corrosion and corrosion fatigue --- 304 austenitic stainless steel and al 2024
[AD-A078511] N80-20372

DAMPING
Apparatus for damping operator induced oscillations of a controlled system --- using adaptive filters to damp oscillations in a flight control system
[NASA-CASE-FRC-11041-1] N80-20488
Fluid and thermodynamic characteristics of compressible recoil
[AD-A078587] N80-20548

DATA ACQUISITION
Design of data acquisition and control systems for environmental monitoring and microclimate control
[COO-4397-T3] N80-20924
Satellite activities of NOAA 1978 --- geostationary and polar orbiting systems
[PB80-112782] N80-21002

DATA BASES
Mechanization architecture for enhancement of avionics planning data base
[AD-A075572] N80-20267
The data bank in the cartographic automation system N80-20660
Data capture for cartographic data bases N80-20689
Functional analysis of the Water Resources Scientific Information Center (WRSIC)
[PB80-111842] N80-20804
Panel discussion: Bridging the gap technology developing flight hardware N80-20823
Description of the Wharton/ODA system
[AD-A079601] N80-21191
Advanced query techniques
[AD-A079626] N80-21192

DATA COLLECTION PLATFORMS
Development of A seismic data collection platform N80-20745

DATA COMPRESSION
Sources of variations in LANDSAT autocorrelation --- Richmond, Virginia and Denver, Colorado N80-20767

DATA CORRELATION
Sources of variations in LANDSAT autocorrelation --- Richmond, Virginia and Denver, Colorado N80-20767
Pre-stack partial migration N80-20963

DATA LINKS
Biomedical communications experiments. Using the communications technology satellite: Technical evaluation
[PB80-111016] N80-20476

DATA PROCESSING
Cartography applications and research N80-20654
On the displacement problem as part of a process in generalizing topographical maps. Proposition for heirarchial order and the search for EDP assisted solutions N80-20675
Linear array pushbroom radiometer data analysis N80-20784
Computer processing of multispectral scanner data over coal strip mines
[PB80-111677] N80-20803
Pre-stack partial migration N80-20963
Description of data entry for automated cost estimating
[K/CSD/TM-29-REV-1] N80-21196

DATA REDUCTION
Real-time data reduction capabilities at the Langley 7 by 10 foot high speed tunnel
[NASA-TM-78801] N80-20286
Fast Fourier transform square wave voltammetry N80-20335
Line generalization and data reduction from a mathematical optimization point of view N80-20678
Day-night differences in radiosonde observations of the stratosphere and troposphere
[PB80-117989] N80-20995
Bathymetric data reduction subsystem
[AD-A079624] N80-21008

DATA RETRIEVAL
A digital terrain model for large surfaces and direct storage access N80-20681
Advanced query techniques
[AD-A079626] N80-21192

DATA SYSTEMS
Data capture for cartographic data bases N80-20689

DATA TRANSMISSION
Experimental Image Compression Subsystem (EICS) communication testing
[AD-A077546] N80-20470
Source coding with side information and universal coding
[PB80-108343] N80-21195

DAWN CHORUS
Substorm-related VLF chorus events: Local-time dependence and relationship to newly-injected clouds of drifting energetic electrons N80-20450

DECIDUOUS TREES
Remote monitoring of forest cover conditions --- deciduous tree defoliation in Pennsylvania N80-20763

DECISION MAKING
Adaptive estimation of information values in continuous decision making and control of advanced aircraft
[AD-A077917] N80-20281
Decision analysis: Engineering science or clinical art
[AD-A079035] N80-21078
Description of the Wharton/ODA system
[AD-A079601] N80-21191

DECISION THEORY
Decision analysis: Engineering science or clinical art
[AD-A079035] N80-21078
On the candidate date problem with a random number of candidates
[AD-A075577] N80-21092

DECONTAMINATION
Decontamination of metals containing plutonium and americium
[ANL-78-13] N80-20599

DEFECTS
Characterization of casting defects in typical castings of a directionally solidified superalloy
[AD-A077270] N80-20376

DEFENSE COMMUNICATIONS SATELLITE SYSTEM
Cell short circuit, preshort signature N80-20650

DEFLAGRATION
Deflagration wave formed by ion beam. Part 3: With energy of direct fusion reaction
[IPPJ-435-PT-3] N80-21156

DEFLECTION
Noncontacting method for measuring angular deflection
[NASA-CASE-LAR-12178-1] N80-21138

DEFOLIATION
Remote monitoring of forest cover conditions --- deciduous tree defoliation in Pennsylvania N80-20763

DEFORMATION
Time-dependent inelastic analysis by the boundary element method and the finite element method N80-20616
On the nonlinear deformation geometry of Euler-Bernoulli beams --- rotary wings
[NASA-TP-1566] N80-20619

DEGREES OF FREEDOM
Instantaneous kinematics of multiple degree-of-freedom motions N80-21098

DEHYDRATION
Remote sensing of leaf water content in the near infrared N80-20768
Chemical primary sludge thickening and dewatering
[PB80-108970] N80-21222

DEMAND (ECONOMICS)
Perlite: Mineral commodity profiles
[PB80-111362] N80-20359
Molybdenum. Mineral commodity profiles
[PB80-110885] N80-20392
Resource and energy constraints of regional and global availability of aluminum copper, and iron 1975 - 2000: A computer study N80-20720
Lithium Mineral commodity profiles
[PB80-123011] N80-20799
Urban transportation energy conservation: Analytic procedures for estimating changes in travel demand and fuel consumption, volume 2
[DOE/PE/8628-1-VOL-2] N80-21207

DENSITY DISTRIBUTION
Information theory density distribution --- Earth Mantle N80-20753

DESALINIZATION
Research and development on a spiral-wound membrane system for single-stage seawater desalination
[PB80-114705] N80-20357

DESIGN ANALYSIS
Lubrication of rolling-element bearings
[NASA-TM-81449] N80-20591
Update, comparing different plate treatments and design N80-20860

DESTRUCTIVE TESTS
Electrical, thermal and abusive tests on lithium thionyl chloride cells N80-20829

DESULFURIZING
Hot gas cleanup process
[PB80-108467] N80-20950

DETERGENTS
Applications of liquid chromatography in the field of surface-active compounds
[BLL-RTS-11948] N80-20326

DETONATION
Initiation mechanisms of solid rocket propellant detonation
[AD-A079986] N80-20411

DETONATION WAVES
Deflagration wave formed by ion beam. Part 3: With energy of direct fusion reaction
[IPPJ-435-PT-3] N80-21156

DEUTERIUM
Measures of the transverse differential effect for the rotary excitation of the molecule HD colliding with Ne and D2
[MPIS-16/1978] N80-21124

DF LASERS
Hydrogen fluoride and deuterium fluoride lasers, Volume 2. A bibliography with abstracts, 1976-1979
[PB80-803273] N80-20586

DIAGNOSIS
Glycerol test in diagnosing increased intralabyrinth pressure
[NASA-TM-76110] N80-21022
DIELECTRICS
Dispersion and attenuation characteristics of modes in a TEM-Cell with a lossy dielectric slab
[PB80-105141] N80-20571
DIES
Internal quality of aluminum die castings
N80-20601
Study program to develop and evaluate die and container materials for the growth of silicon ribbons — for development of low cost solar cells
[NASA-CR-162899] N80-20518
DIESEL ENGINES
A 150 and 300 kW lightweight diesel aircraft engine design study
[NASA-CR-3260] N80-20271
Detailed modeling of diesel combustion
[CONF-7709196-1] N80-20352
Evaluation of exhaust collection configuration on diesel particulate measurement
[PB80-104995] N80-20941
The impact of future diesel emissions on the air quality of large cities
[PB80-113657] N80-20947
DIESEL FUELS
Stability survey of hydrocarbon fuels
[BETC-1778-4] N80-20424
Light-duty diesel gaseous emissions measurement - comparison of dilution tunnel test results to certification cell test results
[PB80-115991] N80-20945
DIFFERENCE EQUATIONS
On the existence of simple Liapunov functions for linear retarded difference differential equations
[AD-A075553] N80-21066
DIFFERENTIAL EQUATIONS
Dynamic buckling of a rigid-plastic cylindrical shell: A second order differential equation subject to four boundary conditions
[COO-4122-29] N80-20636
Applying integrals of motion to the numerical solution of differential equations
[NASA-TM-58225] N80-21059
On the existence of simple Liapunov functions for linear retarded difference differential equations
[AD-A075553] N80-21066
Numerical methods for stiff nonlinear and quadratic differential equations
[AD-A079303] N80-21077
Lectures on the practical solution of differential equations
[ORNL/TM-6920] N80-21082
DIFFERENTIAL GEOMETRY
Differential geometry applied to geodesy in the case of the gravity field of the earth
[SER-C/DISS-250-MITT-148] N80-20975
DIFFRACTION
Studies of the statistical bias and signal characteristics of laser velocimeters
[AD-A079634] N80-20579
DIFFRACTION PATTERNS
Standard X-ray diffraction powder patterns. Section 16: Data for 86 substances
[PB80-110364] N80-21183
DIFFUSION COEFFICIENT
Transport properties in the atmosphere of Jupiter
[NASA-CR-162897] N80-21234
DIFFUSION FLAMES
Purely buoyant diffusion flames: Some experimental results
[PB80-112113] N80-20364
Pollutant formation in flat laminar opposed jet diffusion flames N80-20919
DIFFUSION THEORY
Bifurcations of a model diffusion-reaction
[AD-A079725] N80-21071
DIFFUSIVITY
Grain-boundary diffusion: Structural effects, models and mechanisms
[CONF-7909100-1] N80-20387
The effect of plastic deformation on the transport of hydrogen in nickel
[AD-A077660] N80-20391
DIGITAL DATA
Improvement in classification accuracy of LANDSAT MSS data in areas of mountainous terrain
N80-20766
Linear array pushbroom radiometer data analysis
N80-20784
DIGITAL RADAR SYSTEMS
Nowcast and short-range (0-2 hour) forecasts of thunderstorms and severe convective weather for use in air traffic control
[AD-A080426] N80-20247
DIGITAL SIMULATION
A digital terrain model for large surfaces and direct storage access N80-20681
DIGITAL SYSTEMS
Analysis of first and second order binary quantized digital phase-locked loops for ideal and white Gaussian noise inputs
[NASA-CR-162841] N80-20250
Sampled-data analysis in parameter space
[AD-A077879] N80-20297
Memory-based frame synchronizer — for voice data processing in digital communication systems
[NASA-CASE-GSC-12430-1] N80-20453
Sampling digital multiple channel same frequency repeater study
[AD-A078817] N80-20472
Automated synthesis of digital hardware modules: Simulation and verification of interconnections
[AD-A078463] N80-21038
DIGITAL TECHNIQUES
Fast Fourier transform square wave voltammetry
N80-20335
Some aspects of block quantization with applications to source coding and digital holography N80-20562
Development, status, and goals of cartographic automation N80-20655
Automatic acquisition and processing of cartographic data N80-20656
Computer based generalization for the elaboration and extension of topographic maps N80-20658
The data bank in the cartographic automation system N80-20660
Digital height model with ITEK correlator
N80-20669
Digital map bases from photogrammetric measurements N80-20671
Tasks and possibilities of digital image data processing in photogrammetry N80-20672
DIGITAL TO ANALOG CONVERTERS
A 20 bit plus sign, relay switched D/A converter
[PB80-105331] N80-20509
Graphic production of maps on screens or photocomposition devices N80-20659
Setting data from multistage analytical orientation
N80-20709
On the writing accuracy of the reproduction unit of the Optronics System P1700 N80-20711
DIGITAL TRANSDUCERS
Development of numerical techniques and computer systems for design, analysis and fabrication of interdigital transducers as surface acoustic wave devices
[AD-A079623] N80-20493
DIODES
Theory and applications of negative differential resistance in the current-voltage characteristics of metal-insulator-metal diodes N80-20484
Measurement techniques for high power semiconductor materials and devices
[DOE/RA-0041] N80-20506
DIPOLE ANTENNAS
On the physical realizability of broad-band equivalent circuits for wire loop and dipole antennas
[AD-A079961] N80-20498
DIRECT CURRENT
Testing the corrosion protection properties of coatings by means of pulsed direct current
[BLL-RTS-11872] N80-20366
DIRECTIVITY
Directional selectivity and its use in early visual processing — construction of directionally selective units and their use in processing visual motion
[AD-A078054] N80-21144
DISCHARGERS
Additional reversal characteristics of sealed nickel cadmium cells N80-20848
DISKS
A symbol disk with interchangeable symbols and its applications to cartography N80-20677
DISPLACEMENT
On the displacement problem as part of a process in generalizing topographical maps. Proposition for heirarchial order and the search for EDP assisted solutions N80-20675
DISPLAY DEVICES
Development of a color alphanumeric liquid crystal display — suitable for aircraft command and control
[AD-A079289] N80-20266
Investigation of in situ composites for electromagnetic device applications with emphasis on development of microwave tube cathodes and high resolution displays
[AD-A079698] N80-20321
Signs and display systems: Graphic design and human engineering. A bibliography with abstracts
[PB80-803158] N80-21031
Research on new electronic display technologies
[AD-A079323] N80-21035
A direct measure of CRT image quality
[AD-A075610] N80-21146
DISSOCIATION
Determination of molecular-ion structures through studies of the collisionally-induced dissociation of fast (MeV) molecular ions
[CONF-790843-10] N80-21118
DISTORTION
Web distortion and flexural-torsional buckling
[PB80-116221] N80-20444
DISTRIBUTED PARAMETER SYSTEMS
Closed-loop eigenvalue specification for infinite dimensional systems augmented and deficient hyperbolic cases
[AD-A079727] N80-21053
Smoothness priors and the distributed lag estimator
[AD-A075574] N80-21090
DISTRICT OF COLUMBIA
NASA-census Application Pilot Test (APT) and urban area delineation studies — Seattle, Washington; Austin, Texas; Orlando, Florida; Boston, Massachusetts, and Richmond, Virginia N80-20765
DIURNAL VARIATIONS
The 1-GWh diurnal load-leveling superconducting magnetic energy storage system reference design. Appendix C: Dewar and structural support
[LA-7885-MS-VOL-6] N80-20897
DIVERTERS
Divertor experiments in a toroidal plasma, with ExB drift due to an applied radial electric field
N80-21151
DOPED CRYSTALS
Compensation mechanisms in GaAs. Study of chrome and oxygen in this material and their influence in obtaining semi-insulating GaAs
[LEP-79/640.SME-645-C] N80-21182
DOPPLER EFFECT
Effect of linear approximation for satellite Doppler frequency in geodetic positioning
[AD-A078129] N80-20299
The satellite station Wetzell N80-20641
Contributions of the SFB 78/IFAG to Doppler measurements for satellite positioning N80-20643
Determination of variations of time dependent coordinates through astronomical and Doppler observations N80-20649
The German-Austrian Doppler Observation Campaign N80-20696
The EROS-Doppler Observation Campaign (EROS-DOC) N80-20697
Development of Doppler Observations at Wetzell during 1975-1976 N80-20698
Method and apparatus for Doppler frequency modulation of radiation
[NASA-CASE-NPO-14524-1] N80-21141
The rotation of the Sun: Observations at Stanford — using the Doppler effect
[NASA-CR-162914] N80-21240
DOPPLER RADAR
Remote sensing of ocean surface current and current shear by HF backscatter radar N80-20718
DOSIMETERS
Development and application of the electrochemical etching technique — for thermal and epithermal neutron dosimetry
[ORO-4814-T1] N80-20355
DRAG
The effects of pitching rate on the hydrodynamic properties of hydrofoils
[AD-A079810] N80-20436

Determination of streamline geometry and equivalent radius over arbitrary bodies with application to three-dimensional drag problem
[AD-A077878] N80-20535

DRIFT RATE
Comprehensive study of drift from mechanical draft cooling towers
[PNL-3083] N80-20928

DROP SIZE
Development of droplet sizing for the scrubbing systems
[PB80-108574] N80-20954

DROUGHT
Remote sensing of leaf water content in the near infrared N80-20768
Monitoring drought in Colorado with LANDSAT MSS N80-20770

DRYING
Evaluation of dewatering devices for producing high-solids sludge cake
[PB80-111503] N80-21216

DUCTED FLOW
Laser-Raman measurements in a ducted, two-stream, subsonic, H2/air combustion flow
[AD-A078112] *IPC-20233

DUFFING DIFFERENTIAL EQUATION
Steady motions exhibited by Duffing's equation: A picture book of regular and chaotic motions
[IPPJ-434] N80-21155

DUMMIES
Establishment of the repeatability of performance of the SA103C three year old child test dummies
[PB80-112204] N80-21036

DUNES
Application of LANDSAT imagery to monitor sand dunes movement in the Sahara Desert N80-20719

DUST
Control technologies for particulate and tar emissions from coal converters
[PB80-108392] N80-20949

DYNAMIC CONTROL
Bias errors in a random vibration extremal control strategy
[SAND-79-1222] N80-20632

DYNAMIC MODULUS OF ELASTICITY
Dynamic modulus and damping of boron, silicon carbide, and alumina fibers
[NASA-TM-81422] N80-20313

DYNAMIC PROGRAMMING
System identification structural dynamics: An application to wind force estimation — nonlinear dynamic programming filter N80-20435

DYNAMIC RESPONSE
Time resolved spectroscopy using synchrotron radiation
[LBL-9475] N80-20354
Fluctuating response of circular cylinders in small groups in fluid flow: Discussion and guide to data available
[ESDU-79025] N80-20510
Experimental study of cap and thickness influence on the vibration response and damping of flexible fluid-coupled coaxial cylinders
[CONF-790615-14] N80-20633

DYNAMIC STRUCTURAL ANALYSIS
Technology requirements and readiness for very large aircraft
[NASA-TM-81783] N80-20223
System identification structural dynamics: An application to wind force estimation — nonlinear dynamic programming filter N80-20435
Resonance zones on the surface of a dipping layer due to plane SH seismic input
[PB80-107907] N80-20980

E

EARTH CORE
Spherical harmonic models of the core field N80-20727

EARTH CRUST
Earth Survey Applications Division: Research leading to the effective use of space technology in applications relating to the Earth's surface and interior
[E80-10084] N80-20722
Earth survey applications division: Research leading to the effective use of space technology in applications relating to the Earth's surface and interior
[E80-10087] N80-20723
Geological/geophysical resource assessment — Rio Grande rift N80-20725
Magnetic field modeling and crustal studies N80-20726
Crustal anomaly representation N80-20728
Regional modeling: The Ivrea zone — Northern Italy N80-20731
Global geology and geophysics using satellite-derived data N80-20733
Geophisical atlas N80-20734
Comparative planetology/crustal evolution N80-20735
Crustal deformation: Crustal dynamics project N80-20736
Investigation of crustal dynamics using VLBI N80-20737
Crustal structure and dynamics of southeastern US — Maryland, Virginia, North Carolina, South Carolina, West Virginia, Georgia, Tennessee, and Kentucky N80-20738
Development of A seismic data collection platform N80-20745
Crustal motion measurements in California (SAFE) N80-20746
Gravity model development N80-20748
Information theory density distribution — Earth Mantle N80-20753

EARTH MANTLE
Regional modeling: The Ivrea zone — Northern Italy N80-20731
Interpretation of geoid anomalies in the vicinity of subduction zones — Tonga-Kermadec and the New Hebrides island arc, North Fiji, South Fiji and Lau-havre N80-20732
Global intra-plate volcanism N80-20744
The gravity field in the central pacific from satellite-to-satellite tracking and implications for mantle convection N80-20750
Mantle convection and subcrustal stress N80-20752
Information theory density distribution — Earth Mantle N80-20753
Mean sea surface computation using GEOS-3 altimeter data N80-20760
Hotspots and the evolution of the mantle
[NASA-CR-162906] N80-20964

EARTH MOVEMENTS
Investigation of crustal dynamics using VLBI N80-20737
GSFC site stability N80-20741
Geodetic stability of the Green Bank, West Virginia VLBI site N80-20742
Crustal motion measurements in California (SAFE) N80-20746
The enhanced nodal equilibrium ocean tide and polar motion N80-20754
Polar motion research N80-20755

EARTH ORBITS
Determination of the minimum delta 5 transfer trajectory from a low Earth orbit to a stable orbit around the Lagrangian point L4 in a restricted four-body system
[AD-A079881] N80-20295
Motion of artificial Earth satellites in related orbits N80-20703

EARTH PLANETARY STRUCTURE
Comparative planetology/crustal evolution N80-20735
Plate boundary deformation in California — Southern California: Elsinore, Earthquake Valley, and San Felipe Faults N80-20739
A determination of GM N80-20756
Hotspots and the evolution of the mantle
[NASA-CR-162906] N80-20964

EARTH RESOURCES PROGRAM
Earth resources. A continuing bibliography with indexes; issue 24
[NASA-SP-7041(24)] N80-20717

EARTH ROTATION
Geodyn program systems development N80-20747
Unexplained Lageos perturbation N80-20751
Polar motion and Earth rotation results from Lageos N80-20757

EARTH SURFACE
Simulation study of a geometric shape factor technique for estimating earth-emitted radiant flux densities from wide-field-of-view radiation measurements
[NASA-TP-1629] N80-20986

EARTH TIDES
A survey of the geodetical work of the IFAG from 1952-1977 N80-20640
Earth tides N80-20652
The enhanced nodal equilibrium ocean tide and polar motion N80-20754
Starlette orbit analyses for ocean tidal studies N80-20762

EARTHQUAKE DAMAGE
Earthquake and crustal deformation studies — San Francisco and Fort Ross, California N80-20743

EARTHQUAKE RESISTANT STRUCTURES
Seismic design of reinforced concrete buildings: An inelastic response spectrum approach — earthquake resistant structures beams (supports) N80-20430
Resonance zones on the surface of a dipping layer due to plane SH seismic input
[PB80-107907] N80-20980

EARTHQUAKES
On the selection of station sites for observing strain steps and earthquake forerunners in California N80-20740
Earthquake and crustal deformation studies — San Francisco and Fort Ross, California N80-20743
Development of A seismic data collection platform N80-20745
Finite-difference synthetic seismograms for kinematic models of the earthquake source N80-20960
Resonance zones on the surface of a dipping layer due to plane SH seismic input
[PB80-107907] N80-20980

ECOLOGY
Decline of submerged aquatic plants in Chesapeake Bay
[PB80-114747] N80-21009

ECONOMETRICS
Resource and energy constraints of regional and global availability of aluminum, copper, and iron: 1975 - 2000: A computer study N80-20720

ECONOMIC ANALYSIS
Bismuth: Mineral commodity profiles, August 1979
[PB80-111438] N80-20361
Economics of thermal energy storage for compressed air energy storage systems
[PNL-SA-7949] N80-20903
Economics of compressed air energy storage employing thermal energy storage
[PNL-3191] N80-20904
Economics of weather modification: A review
[PB80-110398] N80-20996
The economic effects of weather modification activities. Part 1: Crop production
[PB80-112048] N80-21005
Innovations and technology transfer: The role of the European Space Agency. Volume 2: Annexes
[ESA-CR-(P)-1219-VOL-2] N80-21213

ECONOMIC DEVELOPMENT
Innovations and technology transfer: The role of the European Space Agency, volume 1
[ESA-CR(P)-1219-VOL-1] N80-21212

ECONOMIC FACTORS
Cadmium
[PB80-111420] N80-20352
The economic effects of weather modification activities. Part 1: Crop production
[PB80-112048] N80-21005

ECONOMIC IMPACT
Economics of weather modification: A review
[PB80-110398] N80-20996
The economic effects of weather modification activities. Part 2: Range production and interindustry analysis
[PB80-112055] N80-21006

EDDY CURRENTS
Multiple property variations in coaxial cylindrical conductors determined with multiple-frequency eddy currents
[NUREG-CR-0967] N80-20505

EDGES
Texture primitive extraction using an edge-based approach
[AD-A078085] N80-21051

EDUCATION
Delaware sea grant college program
[PB80-122401] N80-21011
EIGENVALUES
Initial-value problems in stratified shear flows --- geophysics
[AD-A079525] N80-20542
Asymptotic eigenstructures
[NASA-CR-162900] N80-21050
Closed-loop eigenvalue specification for infinite dimensional systems: augmented and deficient hyperbolic cases
[AD-A079727] N80-21053
EIGENVECTORS
Asymptotic eigenstructures
[NASA-CR-162900] N80-21050
Nonlinear diffraction theory by an eigenfunction expansion of the Green's function --- for surface gravity wave action on a circular cylinder N80-21058
EJECTORS
An experimental study of static thrust augmentation using a 2-d variable ejector
[AD-A079857] N80-20279
ELASTIC BUCKLING
Web distortion and flexural-torsional buckling
[PB80-116221] N80-20444
ELASTIC DAMPING
Dynamic modulus and damping of boron, silicon carbide, and alumina fibers
[NASA-TM-81422] N80-20313
ELASTIC PLATES
Effect of imperfections on the collapse of rectangular plates using variational calculus
[AD-A079905] N80-20827
ELASTIC PROPERTIES
A diagonally dominant solution for the cylinder end problem and a non-axisymmetric elasticity solution for a truncated spherical dome N80-20612
Rigid-plastic finite-element analysis of plastic deformation in metal-forming processes
[AD-A079967] N80-20830
ELASTIC SCATTERING
Kaon-proton backward elastic scattering between 476 and 1064 MeV/c
[LBL-8969] N80-21120
ELECTRIC BATTERIES
The 1979 Goddard Space Flight Center Battery Workshop
[NASA-CP-2117] N80-20820
Overview of NASA battery technology program N80-20821
Panel discussion: Bridging the gap technology developing flight hardware N80-20823
TDRSS battery life cycle tests interim report N80-20845
Life test results of the NASA standard 20 ampere hour cells N80-20846
Battery reconditioning, summary of TRW experience N80-20847
Cell short circuit, preshort signature N80-20850
Accelerated test design N80-20853
Analytical modeling of battery cycle life N80-20856
ELECTRIC CHOPPERS
Error analysis in the measurement of average power with application to switching controllers
[NASA-CR-159792] N80-21202
ELECTRIC CONDUCTORS
Multiple property variations in coaxial cylindrical conductors determined with multiple-frequency eddy currents
[NUREG-CR-0967] N80-20505
A contribution to the stability of electrically conducting Boussinesq fluids by the energy method N80-20522
ELECTRIC CURRENT
Life test results of the NASA standard 20 ampere hour cells N80-20846
ELECTRIC DISCHARGES
Lithium thionyl chloride high-rate discharge N80-20830
Lithium battery discharge tests N80-20831
ELECTRIC EQUIPMENT TESTS
Mission simulator test data --- an overview of a real time mission simulation test program of a nickel cadmium battery N80-20855
Air Force nickel-hydrogen flight experiment N80-20862
Nickel hydrogen cell characterization test results N80-20863
ELECTRIC FIELDS
Divertor experiments in a toroidal plasma, with ExB drift due to an applied radial electric field N80-21151
ELECTRIC GENERATORS
Test and evaluation report of the ERDC Hybrid-Electric Van (HEVAN)
[DOE/TIC-10232] N80-21210
ELECTRIC HYBRID VEHICLES
Electric and hybrid vehicle program
[DOE/CS-0026-7] N80-21204
Mechanical energy storage technology for transportation applications project plan
[UCRL-15138] N80-21209
Test and evaluation report of the ERDC Hybrid-Electric Van (HEVAN)
[DOE/TIC-10232] N80-21210
ELECTRIC IGNITION
Characterization of electrical ignition sources within television receivers
[PB80-103450] N80-20477
ELECTRIC MOTOR VEHICLES
Electric and hybrid vehicle program
[DOE/CS-0026-7] N80-21204
Mechanical energy storage technology for transportation applications project plan
[UCRL-15138] N80-21209
ELECTRIC POWER PLANTS
Economics of compressed air energy storage employing thermal energy storage
[PNL-3191] N80-20904
Environmental assessment methodology: Solar power plant applications. Volume 1. Environmental impact assessment methodology
[EPRI-ER-1070-VOL-1] N80-20926
ELECTRIC POWER SUPPLIES
Lithium cell technology and safety report of the In-Service Lithium Safety Committee N80-20824
ELECTRIC PROPULSION
Impact fusion with a segmented rail gun
[AD-A079811] N80-20307
ELECTRIC WIRE
Calculation of the singularity expansion method parameters from the transient response of a thin wire
[AD-A078852] N80-20457
ELECTRICAL ENGINEERING
Standard engineering installation package, nondirectional beacon
[AD-A078204] N80-20253
ELECTRICAL FAULTS
Characterization of electrical ignition sources within television receivers
[PB80-103450] N80-20477
Determining the mode of high voltage breakdowns in vacuum devices
[GEPP-OP-469] N80-20504
MIL-M-38510/470 test vectors: Fault detection efficiency measurement via hardware fault simulation --- rca 1802 microprocessor
[NASA-CR-162916] N80-21037
ELECTRICAL IMPEDANCE
Thermistor array impedance considerations
[AD-A079886] N80-20492
ELECTRICAL MEASUREMENT
Fast Fourier transform square wave voltammetry N80-20335
Measurement of electrical conductivity in carbon/epoxy composite material over the frequency range 75 MHz to 2.0 GHz
[AD-A078008] N80-20489
Electrical, thermal and abusive tests on lithium thionyl chloride cells N80-20829
Characterization of prototype secondary lithium battery N80-20832
Update of the IUE battery in-flight performance N80-20838
Nickel hydrogen cell characterization test results N80-20863
Error analysis in the measurement of average power with application to switching controllers
[NASA-CR-159792] N80-21202
ELECTRICAL PROPERTIES
Metal-insulator-semiconductor aspects of monolithic zinc oxide surface acoustic wave structures N80-20483
Pocket nickel cadmium cell and battery evaluation N80-20851
ELECTRICAL RESISTANCE
Testing the corrosion protection properties of coatings by means of pulsed direct current
[BLL-RTS-11872] N80-20366
Theory and applications of negative differential resistance in the current-voltage characteristics of metal-insulator-metal diodes N80-20484
ELECTRICAL RESISTIVITY
High electrical resistivity carbon/graphite fibers
[NASA-CR-162909] N80-20312
Measurement of electrical conductivity in carbon/epoxy composite material over the frequency range 75 MHz to 2.0 GHz
[AD-A078008] N80-20489
ELECTRO-OPTICS
Electrooptical devices --- including semiconductor lasers and photodiodes
[AD-A077153] N80-20576
Noncontacting method for measuring angular deflection
[NASA-CASE-LAR-12178-1] N80-21138
Passive infrared surveillance. Part 1: Model formulation
[AD-A075603] N80-21145
Effect of weather at Hannover, Federal Republic of Germany, on performance of electrooptical imaging systems. Part 3: Uncertainties in comparison of FLIR performance in the 3-5 and 8-12 micrometers bands
[AD-A079574] N80-21147
ELECTROACOUSTIC TRANSDUCERS
Fabrication, characterization and optimization of posfet (PVF2-silicon) piezoelectric transducers for low frequency 100 Hz to 500 KHz underwater acoustic applications
[AD-A079113] N80-20500
CDS solid state phase insensitive ultrasonic transducer --- annealing cadmium sulfide crystals
[NASA-CASE-LAR-12304-1] N80-20559
ELECTROCARDIOGRAPHY
Initial dynamics of the EKG during an electrical defibrillation of the heart
[NASA-TM-76002] N80-21019
ELECTROCATALYSTS
Catalyst surfaces for the chromous/chromic redox couple
[NASA-CASE-LEW-13148-1] N80-20487
ELECTROCHEMICAL CELLS
Catalyst surfaces for the chromous/chromic redox couple
[NASA-CASE-LEW-13148-1] N80-20487
Additional reversal characteristics of sealed nickel cadmium cells N80-20848
Reversal of nickel cadmium cells --- chemical reactions N80-20849
ELECTROCHEMISTRY
The development of an electrochemical method for the determination of the effective volume of charged polymers in solution and its application to continuing studies of metal ion binding polyelectrolytes N80-20332
Development and application of the electrochemical etching technique --- for thermal and epithermal neutron dosimetry
[ORO-4814-T1] N80-20355
Testing the corrosion protection properties of coatings by means of pulsed direct current
[BLL-RTS-11872] N80-20366
Electrochemical polymerization and deposition on carbon fibers N80-20396
The 1979 Goddard Space Flight Center Battery Workshop
[NASA-CP-2117] N80-20820
Sulfur studies on lithium sulfur dioxide batteries N80-20828
Nickel electrode plate thickening study N80-20858
Status of the DOE battery and electrochemical technology program
[MTR-8026] N80-20902
ELECTRODEPOSITION
Electrochemical polymerization and deposition on carbon fibers N80-20396
ELECTRODES
The practical limit of loading nickel hydroxide electrodes N80-20857
Nickel electrode plate thickening study N80-20858
Aerospace electrode line N80-20859
Update, comparing different plate treatments and design N80-20860

ELECTROLYTES
The development of an electrochemical method for the determination of the effective volume of charged polymers in solution and its application to continuing studies of metal ion binding polyelectrolytes N80-20332
N-type molybdenum diselenide-based liquid junction solar cells: A non-aqueous electrolyte system employing the chlorine/chloride couple
[AD-A079712] N80-20871
ELECTROLYTIC CELLS
Lightweight fuel cell powerplant components program
[NASA-CR-161412] N80-20306
Catalyst surfaces for the chromous/chromic redox couple
[NASA-CASE-LEW-13148-1] N80-20487
Rechargeable ambient temperature lithium cells N80-20833
Status of the DOE battery and electrochemical technology program
[MTR-8026] N80-20902
ELECTROMAGNETIC FIELDS
Induced electromagnetic fields in conducting bodies irradiated by magnetic fields and microwaves N80-20452
ELECTROMAGNETIC RADIATION
Theoretical and experimental study of the proximity effects of thin-wire antenna in pressure of biological bodies --- electromagnetic radiation effects N80-20451
Absorption characteristics of prolate spheroidal model of man and animals at and near resonance frequency
[PB80-108293] N80-21028
ELECTROMAGNETIC SCATTERING
Investigation of transform techniques for solving electromagnetic radiation and scattering problems
[AD-A077895] N80-20456
Calculation of the singularity expansion method parameters from the transient response of a thin wire
[AD-A075852] N80-20457
Finite element application to transient scattering problems
[AD-A078682] N80-20458
A variational approximation for scattering of scalar waves by stochastic surfaces
[AD-A077066] N80-20463
ELECTROMAGNETIC WAVE TRANSMISSION
Near-millimeter wave technology base study. Volume 1: Propagation and target/background characteristics
[AD-A079620] N80-20461
A variational approximation for scattering of scalar waves by stochastic surfaces
[AD-A077066] N80-20463
Backscattering of electromagnetic waves from electrostatic waves in a magnetized plasma N80-21153
ELECTRON BEAM WELDING
Development of automated welding processes for field fabrication of thick-walled pressure vessels: Electron beam method
[FE-2606-T1] N80-20597
ELECTRON BEAMS
Thermal initiation of high explosives with an electron beam
[AD-A077535] N80-20408
Free electron laser: An introduction
[BNL-26501] N80-20580
Strongly turbulent stabilization of electron beam-plasma interactions
[NASA-CR-162843] N80-21159
ELECTRON EMISSION
Effects of surface structure on secondary electron emission N80-21170
ELECTRON ENERGY
Effects of surface structure on secondary electron emission N80-21170
ELECTRON MICROSCOPY
Microstructural studies of thick film resistors using transmission electron microscopy
[SAND-79-0387C] N80-20508
Load relaxation and transmission electron microscopy studies of germanium N80-21169
ELECTRON MOBILITY
Compensation mechanisms in GaAs. Study of chrome and oxygen in this material and their influence in obtaining semi-insulating GaAs
[LEP-79/640.SME-645-C] N80-21182
ELECTRON PROBES
Frame C: A compact procedure for quantitative energy-dispersive electron probe X-ray analysis
[PB80-110307] N80-20570
ELECTRON RADIATION
Secondary electron radiation
[UCRL-TRANS-11465] N80-21112
ELECTRON SCATTERING
Numerical study of current-driven collisional drift and alfven instabilities in a sheared magnetic field
[IPPJ-436] N80-21157
Parity nonconservation in polarized electron scattering at high energies
[SLAC-PUB-2409] N80-21173
Parity violation in deep inelastic electron scattering
[SLAC-PUB-2432] N80-21178
ELECTRON STATES
Effects of high pressure on molecular electronic spectra. 2: Morse-potential formulation
[AD-A079898] N80-21109
Ground states and magnetic responses of model valence-fluctuation systems
[LA-UR-79-3144] N80-21176
ELECTRON TUNNELING
Application of inelastic electron tunneling spectroscopy to the study of inhibition of aluminum corrosion N80-20367
ELECTRON-ION RECOMBINATION
Coherence in penning ionization and first kind collisions: Volume recombination of ions/electrons
[AD-A079742] N80-21107
ELECTRONIC COUNTERMEASURES
Multiband Klystron study
[AD-A078036] N80-20490
ELECTRONIC EQUIPMENT
An assessment of the risks presented by carbon fiber composites released from motor vehicle fires
[NASA-CR-159207] N80-20311
Dispersion and attenuation characteristics of modes in a TEM-Cell with a lossy dielectric slab
[PB80-105141] N80-20571
ELECTRONIC EQUIPMENT TESTS
High power millimeter wave amplifier --- results of tests on traveling wave tubes
[AD-A078007] N80-20491
ELECTRONIC MODULES
Automated synthesis of digital hardware modules: Simulation and verification of interconnections
[AD-A078463] N80-21038
ELECTRONIC PACKAGING
Computer circuit card puller
[NASA-CASE-FRC-11042-1] N80-20589
ELECTRONIC TRANSDUCERS
Six-foot line transducer calibration procedure: Explains theory, methodology, and procedures used at Sensor Accuracy Check Site (SACS), Long Beach, California
[AD-A079522] N80-21102
ELECTROPLATING
Corrosion resistance of zinc-level plated U-0.75 Ti
[AD-A075539] N80-20373
Development of low cost contacts to silicon solar cells
[NASA-CR-162905] N80-20815
ELECTROSTATIC WAVES
Collisional effects on electrostatic waves in isotropic plasmas N80-21150
Backscattering of electromagnetic waves from electrostatic waves in a magnetized plasma N80-21153
ELLIPSES
General least-squares fitting procedures to minimize the volume of a hyperellipsoid
[LA-8096-MS] N80-21081
ELLIPTIC DIFFERENTIAL EQUATIONS
An estimate related to the strong maximum principle
[AD-A079705] N80-21065
ELONGATION
Strain hardening of iron, axisymmetric vs plane strain elongation
[CONF-790801-5] N80-20380
EMISSION SPECTRA
The structure and dynamics of H2 regions N80-21229
ENERGY ABSORPTION
Design of helical compression springs
[AD-A077113] N80-20593
ENERGY CONSERVATION
Energy conservation in the US: Some interdisciplinary approaches with an emphasis on industrial cogeneration N80-20811
Energy efficient buildings program
[LBL-9576] N80-20877
Urban mass transportation energy conservation: SRGP operating instructions and program documentation, volume 5
[DOE/PE/8628-1-VOL-5] N80-21205
Urban transportation energy conservation: Case city applications of analysis methodologies, volume 3
[DOE/PE/8628-1-VOL-3] N80-21206
Urban transportation energy conservation: Analytic procedures for estimating changes in travel demand and fuel consumption, volume 2
[DOE/PE/8628-1-VOL-2] N80-21207
Analytical procedures for urban transportation energy conservation: Summary of findings and methodologies, volume 1
[DOE/PE/8628-1-VOL-1] N80-21208
ENERGY CONSUMPTION
Industrial fuel choice analysis model. Volume 2: Appendices to model documentation
[DOE/EIA-2832/1-VOL-2-APP] N80-20419
Resource and energy constraints of regional and global availability of aluminum copper, and iron 1975 - 2000: A computer study N80-20720
Analysis and evaluation in the production process and equipment area of the low-cost solar array project
[NASA-CR-162904] N80-20814
Projections of direct energy consumption by mode: The 1975 - 2000 baseline
[ANL/CNSV-4] N80-20878
Industrial Sector Technology Use Model (ISTUM): Industrial energy use in the United States, 1974 - 2000. Volume 2: Results
[DOE/FE-2344/2] N80-20885
Perspective on world energy
[DOE/TIC-10273] N80-20898
Limits to energy modeling
[ORAU-IEA-79-16(0)] N80-20907
ENERGY CONVERSION
Synthetic fuels from peat gasification
[CONF-790803-55] N80-20412
Liquid phase methanation/shift pilot plant operation and laboratory support work
[FE-2036-37] N80-20413
Photochemical conversion of coal to gasoline in an entrained bed reactor
[ORO-5020-T1] N80-20415
Coal liquefaction test center
[FE-1517-78] N80-20425
Wind energy in the mountains of New Hampshire as a potential energy source for Portsmouth Naval Shipyard
[AD-A076975] N80-20868
Milatarized thermoelectric power sources
[AD-A075609] N80-20869
Wind energy information directory
[SERI/SP-69-290] N80-20883
Darrieus vertical axis wind turbine program overview
[SAND-79-2146C] N80-20891
Wind energy systems
[SERI/PR-351-480] N80-20892
Development and evaluation of a model doubly-fed machine
[PB80-100662] N80-20916
Environmental development plan for space applications --- development of nuclear power supplies for use in space
[DOE/EDP-0057] N80-20922
Wind characteristics for field testing of wind conversion systems
[SAND-78-1563] N80-20993
ENERGY CONVERSION EFFICIENCY
Efficient high energy infrared third harmonic generation in gases and liquids for laser fusion applications --- carbon dioxide lasers
[COO-4251-7] N80-20581
Comparison of theoretical and experimental solar cell performance N80-20806
Residential solar heating and cooling using evacuated tube solar collectors: CSN Solar House 3
[COO-2858-24-SUMM] N80-20887

How to burn coal efficiently and economically, and meet air pollution requirements: The fluidized-bed combustion process
[PB80-107501] N80-20911

ENERGY POLICY

Refining and upgrading of synfuels from coal and oil shales by advanced catalytic processes
[FE-2315-37] N80-20407

Industrial fuel choice analysis model. Volume 2: Appendices to model documentation
[DOE/EIA-2832/1-VOL-2-APP] N80-20419

Basic research in engineering: Fluid dynamics and thermal processes --- workshop

ENERGY REQUIREMENTS

A comparative study of the energy alternatives for the State of New York N80-20607

ENERGY STORAGE

Combined solar collector and energy storage system
[NASA-CASE-LAR-12205-1] N80-20810

The 20 watt-hour per kilogram nickel cadmium energy storage for Intelsat V N80-20844

Computer simulation of a solar energy system which utilizes flat-plate collectors
[AD-A079906] N80-20870

Mechnical energy storage technology development
[SAND-79-1151] N80-20874

Hydrogen storage for automobiles
[BNL-26906] N80-20886

Thermal energy storage application areas --- for building heating and cooling
[CONS/5113-T4] N80-20894

The 1-GWh diurnal load-leveling superconducting magnetic energy storage system reference design. Appendix C: Dewar and structural support
[LA-7885-MS-VOL-6] N80-20897

Development and evaluation of a model doubly-fed machine
[PB80-100662] N80-20916

Mechanical energy storage technology for transportation applications project plan
[UCRL-15136] N80-21209

Energy storage systems for automobile propulsion
[UCID-18320] N80-21211

ENERGY TECHNOLOGY

Exploratory studies in catalytic coal liquefaction
[EPRI-AF-1184] N80-20422

Survey of biomass gasification. Volume 1: Synopsis and executive summary
[SERI/TR-33-239-VOL-1] N80-20427

Measurement techniques for high power semiconductor materials and devices
[DOE/RA-0041] N80-20506

Basic research in engineering: Fluid dynamics and thermal processes --- workshop
[FE-2468-54] N80-20551

A comparative study of the energy alternatives for the State of New York N80-20607

Lithium thionyl chloride high rate discharge N80-20830

Lithium battery discharge tests N80-20831

Characterization of prototype secondary lithium battery N80-20832

Milatarized thermoelectric power sources
[AD-A075609] N80-20869

DOE/JPL advanced thermionic technology program
[COO-3056-37] N80-20873

Thermal fluid selection for long-distance heat transmission
[CONF-790803-47] N80-20879

Energy information data base
[DOE/TIC-4579-R10-SUPPL-6] N80-20881

Conversion system overview assessment. Volume 1: Solar thermoelectrics
[SERI/TR-35-078-VOL-1] N80-20882

Residential solar heating and cooling using evacuated tube solar collectors: CSN Solar House 3
[COO-2858-24-SUMM] N80-20887

Installation and startup of the fixed mirror solar concentrator collector field subsystem
[GA-A-15344] N80-20888

The 1-GWh diurnal load-leveling superconducting magnetic energy storage system reference design. Appendix C: Dewar and structural support
[LA-7885-MS-VOL-6] N80-20897

Status of the DOE battery and electrochemical technology program
[MTR-8026] N80-20902

Determining the feasibility of incorporating water resource constraints into energy models
[EPRI-EA-1147] N80-20908

National solar heating and cooling programs
[PB80-104987] N80-20915

Environmental development plan: Coal extraction and preparation
[DOE/EDP-0050] N80-20921

Fusion technology development
[DOE/ET-0116/1] N80-21165

ENERGY TRANSFER

On the physical realizability of broadband lumped-parameter equivalent circuits for energy-collecting structures
[AD-A079962] N80-20499

Energy release rate calculations for interface edge cracks based on a conservation integral
[AD-A079723] N80-20626

ENGINE CONTROL

Alternatives for jet engine control
[NASA-CR-162911] N80-20273

ENGINE DESIGN

A 150 and 300 kW lightweight diesel aircraft engine design study
[NASA-CR-3260] N80-20271

Supporting research and technology for automotive Stirling engine development
[NASA-TM-81495] N80-21200

Fuel economy screening study of advanced automotive gas turbine engines
[NASA-TM-81433] N80-21201

ENGINE INLETS

Optimum subsonic, high-angle-of-attack nacelles
[NASA-TM-81491] N80-20275

Velocity profiles in a long inlet duct employing a photon correlating laser velocimeter without seeding
[AD-A079878] N80-20278

ENGINE TESTING LABORATORIES

Aerosol filter loading data for a simulated jet engine test cell aerosol
[AD-A078779] N80-20287

ENGINE TESTS

Exhaust emissions characteristics for a general aviation light-aircraft Teledyne Continental Motors (TCM) GTSIO-520-K piston engine
[AD-A080433] N80-20270

JT9D-7A (SP) jet engine performance deterioration trends
[NASA-TM-81459] N80-20274

ENGINEERING

Common cause failure analysis techniques: A review and comparative evaluation
[TREE-1349] N80-20603

ENTHALPY

Normal butane: Provisional thermodynamic functions from 135 to 700 K at pressures to 700 bar
[PB80-118193] N80-20365

ENTIRE FUNCTIONS

Applying integrals of motion to the numerical solution of differential equations
[NASA-TM-58225] N80-21059

ENTRAINMENT

Development of superior entrainment separators
[PB80-112394] N80-20936

ENTROPY

Normal butane: Provisional thermodynamic functions from 135 to 700 K at pressures to 700 bar
[PB80-118193] N80-20365

ENVIRONMENT EFFECTS

Environmental assessment methodology: Solar power plant applications. Volume 3. Environmental impact assessment application
[EPRI-ER-1070-VOL-3] N80-20889

Biomass energy systems: Environmental readiness document
[DOE/ERD-0021] N80-20905

Environmental assessment methodology: Solar power plant applications. Volume 1. Environmental impact assessment methodology
[EPRI-ER-1070-VOL-1] N80-20926

Coal-conversion technologies: Some health and environmental effects
[BNL-5103] N80-20930

Environmental assessment of an active oil field in the northwestern Gulf of Mexico, 1977 - 1978. Volume 3: Chemical and physical investigations
[PB80-107899] N80-20939

Assessment of the impact of resource recovery on the environment
[PB80-102874] N80-20948

ENVIRONMENT MANAGEMENT

Guidelines to the air quality management systems, revised
[PB80-109978] N80-20953

ENVIRONMENT MODELS

Systematic sensitivity analysis of air quality simulation models
[PB80-112162] N80-20935

ENVIRONMENT PROTECTION
Public information and lake eutrophication: A case study of Gull Lake in southwestern Michigan
[PB80-113715] N80-20802
Environmental development plan: Coal extraction and preparation
[DOE/EDP-0050] N80-20821
ENVIRONMENTAL MONITORING
Remote monitoring of forest cover conditions --- deciduous tree defoliation in Pennsylvania
N80-20763
Surface mine monitoring --- Pennsylvania
N80-20764
Design of data acquisition and control systems for environmental monitoring and microclimate control
[COO-4397-T3] N80-20924
Survey of instrumentation for environmental monitoring: Major update. Volume 3: Radiation
[LBL-1-VOL-3] N80-20925
Environmental assessment methodology: Solar power plant applications. Volume 1. Environmental impact assessment methodology
[EPRI-ER-1070-VOL-1] N80-20926
Interpretation of environmental assessment data
[PB80-108160] N80-20933
Application of germanium detectors to environmental monitoring
[PB80-113624] N80-20936
Further characterization of sorbents for environmental sampling
[PB80-118763] N80-20944
Satellite activities of NOAA 1978 --- geostationary and polar orbiting systems
[PB80-112782] N80-21002
Formulation of a preliminary assessment of halogenated organic compounds in man and environmental media
[PB80-112170] N80-21029
ENVIRONMENTAL TESTS
Stress corrosion environmental effects on AF 1410 --- aircraft construction materials
[AD-A078598] N80-20374
EPOXY RESINS
Prediction and verification of moisture effects on carbon fiber-epoxy composites
[AD-A079557] N80-20320
Transverse compressive testing of thick Kevlar/epoxy laminates
[SAND-79-0176] N80-20322
Performance of a gel permeation chromatograph and its usefulness in examining mixtures of organic materials --- liquid chromatography analysis of epoxy resins
[AD-A079953] N80-20346
Measurement of electrical conductivity in carbon/epoxy composite material over the frequency range 75 MHz to 2.0 GHz
[AD-A078008] N80-20489
EQUATIONS OF MOTION
Example of performance analysis using data obtained concurrently in air-path, body and Earth axes
[ESDU-79018] N80-20225
EQUATORIAL ATMOSPHERE
Preliminary report of numerical simulation of intermediate wavelength collisional Rayleigh-Taylor instability in equatorial spread F
[AD-A079307] N80-20969
EQUATORS
Equatorial Pacific Ocean variability-seasonal and El Nino time scales N80-21007
EQUILIBRIUM FLOW
Initial-value problems in stratified shear flows --- geophysics
[AD-A079525] N80-20542
EQUIVALENT CIRCUITS
On the physical realizability of broad-band equivalent circuits for wire loop and dipole antennas
[AD-A079961] N80-20498
On the physical realizability of broadband lumped-parameter equivalent circuits for energy-collecting structures
[AD-A079962] N80-20499
ERBIUM ALLOYS
Influence of magnetic ordering on the superconducting properties of amorphous (Zr/sub 1-x/Er/sub x/)3Rh alloys
[CALT-822-110] N80-20502
EREP
Earth resources. A continuing bibliography with indexes, issue 24
[NASA-SP-7041(24)] N80-20717
ERGODIC PROCESS
On the scale of fluctuation of random functions
[PB80-107985] N80-21084
EROS (SATELLITES)
The EROS-Doppler Observation Campaign (EROS-DOC) N80-20697
EROSIVE BURNING
Experimental and analytical study of erosive burning of solid propellants
[AD-A079618] N80-20409
ERROR ANALYSIS
Modeling and error analysis of a superconducting gravity gradiometer N80-20557
On the verification of satellite reflectance measurements N80-20694
ERROR CORRECTING DEVICES
On the writing accuracy of the reproduction unit of the Optronics System P1700 N80-20711
ERYTHROCYTES
On the cellular autoimmune mechanism for eliminating erythrocytes normally and under extreme influences
[NASA-TM-75735] N80-21014
ESTIMATING
Rotor model parameters estimation and rotor balancing studies with quadratic programming
N80-20587
Consistent estimation of variance parameters from many small samples with different means
[AD-A078227] N80-21097
Properties of isotonic estimators of mean lifetime in a simple prototype development model
[AD-A075578] N80-21091
ETCHING
Development and application of the electrochemical etching technique --- for thermal and epithermal neutron dosimetry
[ORO-4814-T1] N80-20355
ETHANE
Liquid phase methanation/shift pilot plant operation and laboratory support work
[FE-2036-37] N80-20413
ETHYLENE
Molecular beam photoionization and gas-surface scattering
[LBL-9838] N80-21177
EULER-LAGRANGE EQUATION
A recursive Lagrangian formulation of manipulator dynamics and a comparative study of dynamics formulation complexity
[AD-A078067] N80-21062
EUROPE
Elaborating an astronomical longitude system
N80-20647
Geophisical atlas N80-20734
Investigation of crustal dynamics using VLBI
N80-20737
EUROPEAN SPACE AGENCY
Study and implementation of an ESA computerized planning system, phase 1. Volume 2: Data files and updating
[GTS-760972-VOL-2] N80-21196
Study and implementation of an ESA computerized planning system, phase 2. Volume 4: Updating of Subprograms ESA 1-5
[GTS-760972-VOL-4] N80-21187
Study and implementation of an ESA computerized planning system, phase 2. Volume 5: Project returns and benefits
[GTS-760972-VOL-5] N80-21186
Study and implementation of an ESA computerized planning system. Executive summary
[GTS-760972-VOL-6] N80-21189
Innovations and technology transfer. The role of the European Space Agency, volume 1
[ESA-CR(P)-1219-VOL-1] N80-21212
Innovations and technology transfer. The role of the European Space Agency. Volume 2: Annexes
[ESA-CR-(P)-1219-VOL-2] N80-21213
EUTECTICS
Investigation of in situ composites for electromagnetic device applications with emphasis on development of microwave tube cathodes and high resolution displays
[AD-A079698] N80-20321
EUTROPHICATION
Public information and lake eutrophication: A case study of Gull Lake in southwestern Michigan
[PB80-113715] N80-20802
EVAPORATION
Monthly climatology for evaporation duct occurrence in the North Atlantic Ocean
[AD-A075524] N80-20992
EXCIMERS
Investigation of Hg2 as a discharge pumped optical storage medium
[COO-4630.A000-1] N80-20582
EXCITONS
Optical determination of the properties of excitons bound to impurities in semiconductors N80-21139
EXHAUST EMISSION
Exhaust emissions characteristics for a general aviation light-aircraft Teledyne Continental Motors (TCM) GTSIO-520-K piston engine
[AD-A080433] N80-20270
Particle diagnostics using Mie scattering and image intensification techniques --- to analyze particles in exhaust emission
[AD-A079888] N80-20541
Evaluation of exhaust collection configuration on diesel particulate measurement
[PB80-104995] N80-20941
Light-duty diesel gaseous emissions measurement - comparison of dilution tunnel test results to certification cell test results
[PB80-115991] N80-20945
The impact of future diesel emissions on the air quality of large cities
[PB80-113657] N80-20947
EXHAUST GASES
Exhaust emissions characteristics for a general aviation light-aircraft Teledyne Continental Motors (TCM) GTSIO-520-K piston engine
[AD-A080433] N80-20270
Design of photochemical reaction chamber --- to study exhaust gases from coal fired power plants
[PB80-100654] N80-20360
Factors affecting cleanup of exhaust gases from a pressurized, fluidized-bed coal combustor
[NASA-TM-81439] N80-20532
EXISTENCE THEOREMS
On the existence of simple Liapunov functions for linear retarded difference differential equations
[AD-A075553] N80-21066
EXOBIOLOGY
Fifth Working Conference (Space Biology) at the 21st Plenary Session of COSPAR
[NASA-TM-76107] N80-21017
EXPERIMENTAL DESIGN
Gas flow in fluidized beds of large particles: Experiment and theory N80-20525
Combinatorial problems of applied discrete mathematics
[AD-A079521] N80-21075
To the solar foci --- design of experiments to study effect of the solar foci gravity waves and gravitational fields N80-21236
EXPLOSIVES
Thermal initiation of high explosives with an electron beam
[AD-A077535] N80-20408
EXPONENTIAL FUNCTIONS
Pulsatile laminar flow separation in an exponentially diverging tube N80-20526
EXTERNAL STORES
Aerodynamic characteristics and store loads of the 1/24-scale F-111 aircraft model with several external store loadings
[AD-A078677] N80-20235
Wing/store flutter with nonlinear pylon stiffness
[NASA-TM-81789] N80-20280
EXTRATERRESTRIAL RADIATION
Interstellar matter and extragalactic light
N80-21226
EXTRUDING
Experimental laboratory measurement of thermophysical properties of selected coal types
[NASA-CR-162913] N80-20404

F

F REGION
Preliminary report of numerical simulations of intermediate wavelength ExB gradient drift instability in ionospheric plasma clouds
[AD-A079313] N80-20968

F-4 AIRCRAFT
F-4 Phantom aircrew survival equipment evaluation
[AD-A076330] N80-20245
A singular perturbation analysis of minimum time long range intercept
[NASA-CR-162895] N80-20261

F-15 AIRCRAFT
Evaluation of packaging for the CN-1325/ASN-108 AHRS displacement gyro, F-15 aircraft
[AD-A078707] N80-20264

F-16 AIRCRAFT
An operating and support cost model for avionics automatic test equipment --- f-16 aircraft
[AD-A075586] N80-20269

F-111 AIRCRAFT
Aerodynamic characteristics and store loads of the 1/24-scale F-111 aircraft model with several external store loadings
[AD-A078677] N80-20235

FABRICATION
Development of automated welding processes for field fabrication of thick-walled pressure vessels: Electron beam method
[FE-2606-T1] N80-20597

FACSIMILE COMMUNICATION
National Weather Service forecasting handbook no. 1: Facsimile products
[PB80-125255] N80-21004

FAILURE
Structural tests on a tile/strain isolation pad thermal protection system --- space shuttles
[NASA-TM-80226] N80-20302
Coil spring failures in aerospace hardware
[AD-A077808] N80-20595

FAILURE ANALYSIS
Advanced composites: Design and application. Proceedings of the meeting of the Mechanical Failures Prevention Group
[NASA-CR-162864] N80-20325
Common cause failure analysis techniques: A review and comparative evaluation
[TREE-1349] N80-20603
Development of failure model for nickel cadmium cells N80-20854

FAILURE MODES
Determining the mode of high voltage breakdowns in vacuum devices
[GEPP-OP-469] N80-20504
Mod 1 wind turbine generator failure modes and effects analysis
[NASA-CR-159494] N80-20864

FARM CROPS
Plant stress and relationships to spectral responses --- cotton and tomato plants N80-20769
Monitoring drought in Colorado with LANDSAT MSS N80-20770

FARMLANDS
Surface mine monitoring --- Pennsylvania N80-20764
Major uses of land in the United States, 1974
[PB80-114226] N80-20796

FAST FOURIER TRANSFORMATIONS
Fast Fourier transform square wave voltammetry N80-20335

FATIGUE (MATERIALS)
Development of a procedure for estimating the high cycle fatigue strength of some high temperature structural alloys
[BNL-NUREG-26085] N80-20378
Fatigue crack propagation in Hastelloy X weld metal
[ORNL/TM-6999] N80-20386
An evaluation of four current models to predict the creep-fatigue interaction in rene 95
[AD-A077168] N80-20623

FEASIBILITY ANALYSIS
Feasibility of cogeneration application of a 4.8 MW fuel cell power plant at a Santa Clara, California paper mill
[SAN-2189-T1] N80-20876

FEEDBACK CONTROL
Stabilizing an unstable orbit about L3 in the Sun, Earth, Moon system using linear constant gain feedback
[AD-A079860] N80-20292
Closed-loop eigenvalue specification for infinite dimensional systems augmented and deficient hyperbolic cases
[AD-A079727] N80-21053

FERROELECTRICITY
Ion implantation in perovskite type ferroelectrics
[AD-A080078] N80-20495

FIBER COMPOSITES
An assessment of the risks presented by carbon fiber composites released from motor vehicle fires
[NASA-CR-159207] N80-20311
High electrical resistivity carbon/graphite fibers
[NASA-CR-162909] N80-20312

FIBER OPTICS
Passive fiber optic gyro study
[AD-A079471] N80-20566

FIBERS
A model theory for the fibrous absorber. Part 1: Regular fibre arrangements
[NASA-TM-75800] N80-21101
Optical detection of fiber particles in water --- Lake Superior
[PB80-116866] N80-21148

FIBRILLATION
Initial dynamics of the EKG during an electrical defibrillation of the heart
[NASA-TM-76002] N80-21019

FIELD EFFECT TRANSISTORS
GaAs analog integrated circuits (GaAs RF-LSI), phase 1. Volume 2: Appendices
[AD-A079589] N80-20496

FIELD THEORY (PHYSICS)
Dense and dilute instanton-anti-instanton pair configurations
[COO-1545-263] N80-21118
Unified gauge theories in nuclear physics N80-21127

FIGHTER AIRCRAFT
Aircraft motion sensitivity to dynamic stability derivatives --- motion simulation studies using cross coupling derivatives on fighter/ bomber aircraft
[AD-A079421] N80-20283

FINITE DIFFERENCE THEORY
A numerical study of normal-shock/turbulent boundary layer interactions
[AD-A079858] N80-20537
Numerical solution of the two-dimensional incompressible averaged Navier-Stokes equations for finite arbitrary shaped isolated bodies, part 1
[AD-A080093] N80-20544
Introduction to computational techniques for boundary layers
[SAND-79-0893] N80-20550
Column buckling of isotropic and composite beams using a truncated Fourier series
[AD-A079862] N80-20629
Numerical simulation of dual-media thermal energy storage systems
[SAND-78-2282] N80-20875
Finite-difference synthetic seismograms for kinematic models of the earthquake source N80-20960
The generation of synthetic seismograms for laterally heterogeneous models using the finite difference technique N80-20962
High order finite difference methods for elliptic boundary value problems N80-21042

FINITE ELEMENT METHOD
Finite element application to transient scattering problems
[AD-A078682] N80-20458
Finite-element analysis of problems involving stress singularities --- including lap joints and elastic crack problems N80-20610
Time-dependent inelastic analysis by the boundary element method and the finite element method N80-20616
An investigation of rib stiffened hyperbolic cooling tower under statical loads using discrete field and Galerkin finite element methods N80-20617
Singular finite element shape functions in estimating stress intensity factors N80-20618
Rigid-plastic finite-element analysis of plastic deformation in metal-forming processes
[AD-A078987] N80-20630
Waste isolation safety assessment program. A brief description of the three-dimensional finite element ground-water flow model adapted for waste isolation safety assessments
[PNL-2652] N80-21131

FIRE CONTROL
Advanced FIREFLY assessment generalized mechanization requirements report
[AD-A079752] N80-20263

FIRES
An assessment of the risks presented by carbon fiber composites released from motor vehicle fires
[NASA-CR-159207] N80-20311

FIXED POINTS (MATHEMATICS)
A globally convergent ball newton method
[AD-A079728] N80-21072

FLAME PROPAGATION
On flame spread mechanism over combustible solid surface
[BLL-RTS-12027] N80-20327
Asymptotic analysis of near-stoichiometric flame propagation N80-20330
Combustion and operating characteristics of spark-ignition engines
[NASA-CR-162896] N80-20340
Purely buoyant diffusion flames: Some experimental results
[PB80-112113] N80-20364
Flame propagation, autoignition and combustion in alcohol-petroleum-air mixtures and other alternative fuels
[COO-4486-5] N80-20420

FLAME TEMPERATURE
Purely buoyant diffusion flames: Some experimental results
[PB80-112113] N80-20364

FLAMES
The structure of eddies in turbulent flames, volume 1
[AD-A078625] N80-20341
Theoretical and computational approach to modeling flame ignition
[AD-A079306] N80-20347
Atomic and molecular gas phase spectrometry
[AD-A079657] N80-20350

FLAMMABILITY
On flame spread mechanism over combustible solid surface
[BLL-RTS-12027] N80-20327

FLAT PLATES
Vibration of plates of various geometries N80-20613
Computer simulation of a solar energy system which utilizes flat-plate collectors
[AD-A079906] N80-20870

FLEXING
Web distortion and flexural-torsional buckling
[PB80-116221] N80-20444

FLIGHT CHARACTERISTICS
Human comfort response to dominant random motions in longitudinal modes of aircraft motion
[NASA-CR-159186] N80-21033
Human comfort response to random motions with a dominant pitching motion
[NASA-CR-159140] N80-21034

FLIGHT CONTROL
Advanced FIREFLY assessment generalized mechanization requirements report
[AD-A079752] N80-20263
Coding, testing and documentation of processors for the flight design system
[NASA-CR-160552] N80-20289
Apparatus for damping operator induced oscillations of a controlled system --- using adaptive filters to damp oscillations in a flight control system
[NASA-CASE-FRC-11041-1] N80-20488

FLIGHT CREWS
F-4 Phantom aircrew survival equipment evaluation
[AD-A076330] N80-20245
Summary of Department of Transportation/Federal Aviation Administration task force on crew workload report
[AD-A068189] N80-21032

FLIGHT HAZARDS
Development of wind shear models and determination of wind shear hazards
[AD-A080588] N80-20243

FLIGHT PATHS
A singular perturbation analysis of minimum time long range intercept
[NASA-CR-162895] N80-20261
FLIGHT SIMULATION
Airborne aids for coping with low-level wind shear. All-weather landing systems, engineering services support project, task 2 --- the use of aircraft instruments, flight simulation techniques, and mathematical models to understand wind shear effects during aircraft approach and takeoff
[AD-A080589] N80-20242
Rotocraft flight simulation, computer program C81. Volume 3: Programmer's manual
[AD-A077345] N80-20262
FLIGHT TESTS
Preliminary airworthiness evalaution, AH-1G with the airborne target acquisition fire control system and the hellfire modular missile system installed
[AD-A078340] N80-20265
Air Force nickel-hydrogen flight experiment
N80-20862
FLIR DETECTORS
Effect of weather at Hannover, Federal Republic of Germany, on performance of electrooptical imaging systems. Part 3: Uncertainties in comparison of FLIR performance in the 3-5 and 8-12 micrometers bands
[AD-A079574] N80-21147
FLORIDA
NASA-census Application Pilot Test (APT) and urban area delineation studies --- Seattle, Washington; Austin, Texas; Orlando, Florida; Boston, Massachusetts, and Richmond, Virginia N80-20765
Estimating nocturnal surface temperature in Florida using thermal data from geostationary satellite data
N80-20982
FLOW CHARACTERISTICS
Ground plane effects on a contoured surface at low subsonic velocities
[AD-A079877] N80-20237
Aerodynamics of advanced axial-flow turbomachinery
[AD-A079617] N80-20277
Kinematics and dynamics of vortex rings in a tube
N80-20524
Fluid and thermodynamic characteristics of compressible recoil
[AD-A078587] N80-20548
Laboratory study of flow and thermal structures in heated and/or cooled layers of water
[PB80-120694] N80-20556
FLOW DISTRIBUTION
Wake flowfields for Jovian probe
[NASA-CR-159235] N80-20230
Operational implications of some NACA/NASA rotary wing induced velocity studies
[NASA-TM-80232] N80-20231
The development of rapid predictive methods for three-dimensional transonic flow fields about fighter bomber aircraft, part 1
[AD-A078683] N80-20236
Scale model studies for establishing the flow patterns of a low-speed tunnel
[NASA-CR-159234] N80-20285
Progress in turbulence modeling for complex flow fields including effects of compressibility
[NASA-TP-1517] N80-20527
Complete supersonic flowfields over blunt bodies in a generalized orthogonal coordinate system
[NASA-TM-81784] N80-20529
Oscillating flow about tube bundles
[AD-A078269] N80-20534
A calculating technique for the flow field around a hydraulic turbine --- panel method
[ILR-37] N80-20553
Conceptual design study of the hylife lithium waterfall laser fusion chamber
[UCRL-13944] N80-20583
Basic studies flow and diffusion over hills
[PB80-112014] N80-20998
FLOW EQUATIONS
Computation of three-dimensional aerodynamic flow
[AD-A080073] N80-20240
FLOW MEASUREMENT
Development of combustion diagnostics and applications to turbulent combustion
[AD-A079523] N80-20348
FLOW STABILITY
A contribution to the stability of electrically conducting Boussinesq fluids by the energy method
N80-20522
Pulsatile laminar flow separation in an exponentially diverging tube N80-20526
Theoretical study of steady vortex rings in the case of variable partitioning of the force
[MPIS-29/1978] N80-20554
FLOW VELOCITY
Operational implications of some NACA/NASA rotary wing induced velocity studies
[NASA-TM-80232] N80-20231
FLOW VISUALIZATION
The structure of eddies in turbulent flames, volume 1
[AD-A078625] N80-20341
Hot wire anemometer investigation of turbulence levels and development of liquid crystal flow visualization techniques for the rectilinear cascade test facility
[AD-A078284] N80-20533
Particle diagnostics using Mie scattering and image intensification techniques --- to analyze particles in exhaust emission
[AD-A079888] N80-20541
FLUID DYNAMICS
Basic research in engineering: Fluid dynamics and thermal processes --- workshop
[FE-2468-54] N80-20551
FLUID FILTERS
Aerosol filter loading data for a simulated jet engine test cell aerosol
[AD-A078779] N80-20287
Development of superior entrainment separators
[PB80-112394] N80-20938
FLUID FLOW
Fluctuating response of circular cylinders in small groups in fluid flow: Discussion and guide to data available
[ESDU-79025] N80-20510
FLUID MECHANICS
Fluid mechanics, internal flow sub-series. Volume 7: A guide to fan selection and performance
[ESDU-79037] N80-20511
European scientific notes, volume 33, number 11
[AD-A079711] N80-21241
FLUIDIZED BED PROCESSORS
Support studies in fluidized-bed combustion 1978 annual report
[PB80-112758] N80-20430
Experimental and theoretical investigations of heat transfer between a gas-solid fluidized bed and immersed tubes N80-20514
Gas flow in fluidized beds of large particles: Experiment and theory N80-20525
Factors affecting cleanup of exhaust gases from a pressurized, fluidized-bed coal combustor
[NASA-TM-81439] N80-20532
FLUORESCENCE
Time resolved analysis of fluorescent metal chelates N80-20336
Evaluation of sensitized fluorescence for polynuclear aromatic hydrocarbon detection --- in combustion products
[PB80-108475] N80-20358
Reliability of energy dispersive X-ray fluorescence analysis of low-alloy steels
[AD-A077154] N80-20371
Airborne laser fluorosensing of surface water chlorophyll a --- Lake Mead, Nevada
[PB80-113400] N80-20797
Laser induced fluorescence of trapped molecular ions
[LBL-10021] N80-21114
FLUORIDES
Structure and properties of glasses --- beryllium fluoride glass
[AD-A080071] N80-20400
FLUTTER
Wing/store flutter with nonlinear pylon stiffness
[NASA-TM-81789] N80-20280
FLUX DENSITY
Nonideal compensation in MHD generators --- models of the distortion of the total magnetic flux density by the induced magnetic flux density
N80-21149
FLYWHEELS
Mechnical energy storage technology development
[SAND-79-1151] N80-20874
Mechanical energy storage technology for transportation applications project plan
[UCRL-15138] N80-21209
FOCI
To the solar foci --- design of experiments to study effect of the solar foci gravity waves and gravitational fields N80-21236
FOLDING STRUCTURES
Closed cell structures using triangular plates
N80-20615
FOLIAGE
Remote sensing of leaf water content in the near infrared N80-20768
Assessing soybean leaf area and leaf biomass by spectral measurements --- Beltsville, Maryland Agricultural Research Center N80-20775
FOOD
A global biogeocenotical biosphere simulation
[NASA-TM-76042] N80-20920
FORCED VIBRATION
Steady motions exhibited by Duffing's equation: A picture book of regular and chaotic motions
[IPPJ-434] N80-21155
FOREST MANAGEMENT
Earth Survey Applications Division: Research leading to the effective use of space technology in applications relating to the Earth's surface and interior
[E80-10084] N80-20722
Earth survey applications division: Research leading to the effective use of space technology in applications relating to the Earth's surface and interior
[E80-10087] N80-20723
Remote monitoring of forest cover conditions --- deciduous tree defoliation in Pennsylvania
N80-20763
FORESTS
Geobotanical exploration --- Mineral, Virginia
N80-20724
Surface mine monitoring --- Pennsylvania
N80-20764
Major uses of land in the United States, 1974
[PB80-114226] N80-20796
FORMING TECHNIQUES
Rigid-plastic finite-element analysis of plastic deformation in metal-forming processes
[AD-A078987] N80-20630
FOSSIL FUELS
Industrial fuel choice analysis model. Volume 2: Appendices to model documentation
[DOE/EIA-2832/1-VOL-2-APP] N80-20419
FOUR BODY PROBLEM
Stabilizing an unstable orbit about L3 in the Sun, Earth, Moon system using linear constant gain feedback
[AD-A079860] N80-20292
Application and comparison of stable periodic orbits in the vicinity of Lagrangian points L4 and L5 to a four-body truth model
[AD-A079683] N80-20293
Determination of the minimum delta 5 transfer trajectory from a low Earth orbit to a stable orbit around the Lagrangian point L4 in a restricted four-body system
[AD-A079881] N80-20295
FOURIER SERIES
Column buckling of isotropic and composite beams using a truncated Fourier series
[AD-A079862] N80-20629
FRACTIONATION
Experimental laboratory measurement of thermophysical properties of selected coal types
[NASA-CR-162913] N80-20404
FRACTURE MECHANICS
Effect of heat treatment on fracture of type 304L stainless steel in a hydrogen environment
[DP-MS-79-18] N80-20384
Measurement of transient response of a central crack to a tensile pulse N80-20609
Fracture mechanics of bi-material interface cracks --- the behavior of a metallic interface cracks
N80-20611
On the load displacement relation for a cracked rectangular specimen with constrained ends
[AD-A075527] N80-20624
Materials and mechanics of rate effects in brittle fracture --- cantilever beams and steels
[COO-2422-22] N80-20635

FRACTURE STRENGTH
Correlations between fracture toughness and microstructure in 4140 steel, MRL E-113
[COO-3084-67] N80-20379
FRAMES
Inorganic spark chamber frame and method of making the same
[NASA-CASE-GSC-12354-1] N80-20565
FREE ELECTRON LASERS
Free electron laser: An introduction
[BNL-26501] N80-20580
FREE FLOW
Transition to turbulence in free shear-layers
[AD-A080066] N80-20547
FRENCH SATELLITES
Starlette orbit analyses for ocean tidal studies N80-20762
FREQUENCY CONVERTERS
Sampling digital multiple channel same frequency repeater study
[AD-A078817] N80-20472
FREQUENCY DIVISION MULTIPLE ACCESS
A note on almost noiseless channels
[AD-A077588] N80-20473
FREQUENCY MODULATION
Method and apparatus for Doppler frequency modulation of radiation
[NASA-CASE-NPO-14524-1] N80-21141
FREQUENCY SHIFT
Generation of 16 micron radiation using stimulated rotational Raman scattering in hydrogen --- using a CO2 TEA laser N80-20573
FREQUENCY STABILITY
Velocity space instabilities of alpha particles in Tokamak reactors --- plasma frequency instabilities due to hollow isotropic alpha velocity distributions
[DOE/TIC-11016] N80-21167
FRICTION WELDING
Inertia and friction welding of aluminum alloy 1100 to type 316 stainless steel
[Y-2165-REV] N80-20596
FROST
Periglacial research
[AD-A079280] N80-20967
FUEL CELLS
Performance model for molten carbonate fuel cells
[TR-190] N80-20884
Hydrogen storage for automobiles
[BNL-26906] N80-20886
FUEL COMBUSTION
Application of Raman diagnostics to combustion
[NASA-CR-162901] N80-20339
Chemical kinetic modeling for combustion applications
[UCRL-81777] N80-20353
FUEL CONSUMPTION
The role of technology as air transportation faces the fuel situation
[NASA-TM-81793] N80-20260
JT9D-7A (SP) jet engine performance deterioration trends
[NASA-TM-81459] N80-20274
Fuel economy screening study of advanced automotive gas turbine engines
[NASA-TM-81433] N80-21201
FUEL FLOW
Development of combustion data to utilize low-Btu gases as industrial process fuels, project 61004. Special report no. 7: Premix tunnel burner
[FE-2489-41] N80-20418
FUEL PRODUCTION
Liquid phase methanation/shift pilot plant operation and laboratory support work
[FE-2036-37] N80-20413
FUEL TESTS
Evaluation of fuel character effects on the F101 engine combustion system
[AD-A077860] N80-20405
FUEL-AIR RATIO
Asymptotic analysis of near-stoichiometric flame propagation N80-20330
FUNCTIONAL ANALYSIS
Singular finite element shape functions in estimating stress intensity factors N80-20618
Functional analysis of the Water Resources Scientific Information Center (WRSIC)
[PB80-111842] N80-20804
FUNCTIONS (MATHEMATICS)
Comparison of algorithms for the summation of spherical plane functions N80-20699
Problems of approximation by means of sampling functions N80-20700
FUSION (MELTING)
Impact fusion with a segmented rail gun
[AD-A079811] N80-20307

G

GALACTIC STRUCTURE
The high latitude extensions of galactic spiral arms --- of interstellar gas N80-21226
GALILEO PROBE
Wake flowfields for Jovian probe
[NASA-CR-159235] N80-20230
GALILEO PROJECT
Galileo lithium/SO2 N80-20827
GALLIUM ARSENIDE LASERS
Gallium arsenide lasers. A bibliography with abstracts
[PB80-803612] N80-20585
GALLIUM ARSENIDES
GaAs analog integrated circuits (GaAs RF-LSI), phase 1. Volume 2: Appendices
[AD-A079589] N80-20496
GaAs analog integrated circuits (GaAs RF-LSI), volume 1 --- microwave receivers
[AD-A079588] N80-20497
Compensation mechanisms in GaAs. Study of chrome and oxygen in this material and their influence in obtaining semi-insulating GaAs
[LEP-79/640.SME-645-C] N80-21182
GALLIUM NITRIDES
Evaluation of gallium nitride for active microwave devices
[AD-A079319] N80-20494
GARP ATLANTIC TROPICAL EXPERIMENT
GATE radar rainfall atlas
[PB80-121130] N80-21003
GAS ANALYSIS
Atomic and molecular gas phase spectrometry
[AD-A079657] N80-20350
GAS BEARINGS
Gas bearings, volume 2. Citations from the NTIS data base
[PB80-802499] N80-20600
GAS CHROMATOGRAPHY
A chromatograph injection valve, an apparatus for rapid insertion of miniature glass samplers into the carrier gas flow of a gas chromatograph
[AD-A079882] N80-20345
GAS COMPOSITION
Method and means for helium/hydrogen ratio measurement by alpha scattering
[NASA-CASE-NPO-14079-1] N80-20334
GAS FLOW
A chromatograph injection valve, an apparatus for rapid insertion of miniature glass samplers into the carrier gas flow of a gas chromatograph
[AD-A079882] N80-20345
Gas flow in fluidized beds of large particles: Experiment and theory N80-20525
GAS INJECTION
A chromatograph injection valve, an apparatus for rapid insertion of miniature glass samplers into the carrier gas flow of a gas chromatograph
[AD-A079882] N80-20345
GAS MIXTURES
Laser-Raman measurements in a ducted, two-stream, subsonic, H2/air combustion flow
[AD-A078112] N80-20233
GAS TURBINE ENGINES
Effect of water injection and off scheduling of variable inlet guide vanes, gas generator speed and power turbine nozzle angle on the performance of an automotive gas turbine engine
[NASA-TM-81415] N80-20272
Feasibility study of an isolated reverse-turbine system for gas turbine engines --- marine propulsion
[AD-A077898] N80-20276
Composite wall concept for high temperature turbine shrouds: Survey of low modulus strain isolator materials
[NASA-TM-81443] N80-20398
Fuel economy screening study of advanced automotive gas turbine engines
[NASA-TM-81433] N80-21201
GAS-SOLID INTERACTIONS
Real-gas effects on the aerodynamics of blunt cones as measured in a hypervelocity range
[AD-A075526] N80-20241
Experimental and theoretical investigations of heat transfer between a gas-solid fluidized bed and immersed tubes N80-20514
GASDYNAMIC LASERS
Downstream mixing gasdynamic lasers: A numerical solution --- of supersonic mixing flows below the nozzle exit N80-20572
Separation control in all apt light pipe
[AD-A079904] N80-20577
GASIFICATION
Synthetic fuels from peat gasification
[CONF-790803-55] N80-20412
Survey of biomass gasification. Volume 1: Synopsis and executive summary
[SERI/TR-33-239-VOL-1] N80-20427
GASOLINE
Photochemical conversion of coal to gasoline in an entrained bed reactor
[ORO-5020-T1] N80-20415
Stability survey of hydrocarbon fuels
[BETC-1778-4] N80-20424
Test and evaluation report of the ERDC Hybrid-Electric Van (HEVAN)
[DOE/TIC-10232] N80-21210
GASTROINTESTINAL SYSTEM
Reduction of the duration of restraint for the production of experimental ulcers in rats: Application to the study of protective substances
[NASA-TM-76136] N80-21016
GAUGE INVARIANCE
Unified gauge theories in nuclear physics N80-21127
Phase transitions in lattice gauge theories N80-21172
GAUSS EQUATION
Practical aspects of Gaussian integration
[AD-A079030] N80-21076
GELS
Performance of a gel permeation chromatograph and its usefulness in examining mixtures of organic materials --- liquid chromatography analysis of epoxy resins
[AD-A079953] N80-20346
GENERAL AVIATION AIRCRAFT
A spin-recovery parachute system for light general-aviation airplanes
[NASA-TM-80237] N80-20227
A 150 and 300 kW lightweight diesel aircraft engine design study
[NASA-CR-3260] N80-20271
Development and evaluation of a general aviation real world noise simulator
[NASA-CR-159237] N80-21100
GENERATION
Energy conservation in the US: Some interdisciplinary approaches with an emphasis on industrial cogeneration N80-20811
GEOBOTANY
Earth Survey Applications Division: Research leading to the effective use of space technology in applications relating to the Earth's surface and interior
[E80-10084] N80-20722
Earth survey applications division: Research leading to the effective use of space technology in applications relating to the Earth's surface and interior
[E80-10087] N80-20723
Geobotanical exploration --- Mineral, Virginia N80-20724
GEOCENTRIC COORDINATES
Improved tables of coordinates allotted to the Wetzell satellite tracking station N80-20692
The EROS-Doppler Observation Campaign (EROS-DOC) N80-20697
GEOCHEMISTRY
Strontium isotopic and trace element geochemistry of the Saddle Mountains and Grande Ronde Basalts of the Columbia River Basalt group N80-20958
GEODESY
Reports on cartography and geodesy. Series 1: Original report no. 73
[REPT-73] N80-20638
The 25 years at the Institute for Applied Geodesy N80-20639
A survey of the geodetical work of the IFAG from 1952-1977 N80-20640

The satellite station Wetzell N80-20641
Determination of azimuth and astronomical coordinates N80-20648
The German-Austrian Doppler Observation Campaign N80-20696
Development of Doppler Observations at Wetzell during 1975-1976 N80-20698
Problems of approximation by means of sampling functions N80-20700
The RGST chain program for the determination of potential coefficients and station coordinates N80-20702
Study for a project for a European high precision laser network N80-20704
Information relative to cartography and geodesy. Series 2: Translations
[REPT-37] N80-20714
On a mathematical model for remote sensing altimetry N80-20716
Earth Survey Applications Division: Research leading to the effective use of space technology in applications relating to the Earth's surface and interior
[E80-10084] N80-20722
Earth survey applications division: Research leading to the effective use of space technology in applications relating to the Earth's surface and interior
[E80-10087] N80-20723
Interpretation of geoid anomalies in the vicinity of subduction zones --- Tonga-Kermadec and the New Hebrides island arc, North Fiji, South Fiji and Lau-havre N80-20732
Global geology and geophysics using satellite-derived data N80-20733
Investigation of crustal dynamics using VLBI N80-20737
GSFC site stability N80-20741
Geodetic stability of the Green Bank, West Virginia VLBI site N80-20742
Geodyn program systems development N80-20747
Gravity model development N80-20748
Gravity model improvement for SEASAT N80-20749
A determination of GM N80-20756
The SEASAT altimeter height bias using four Bermuda overflights N80-20758
Mean sea surface computation using GEOS-3 altimeter data N80-20760
Ocean circulation N80-20761
Starlette orbit analyses for ocean tidal studies N80-20762
The spaceborne laser ranging system N80-20785
Astrogravimetric determination of the geoid
[SER-C/DISS-247-MITT-147] N80-20974
Differential geometry applied to geodesy in the case of the gravity field of the earth
[SER-C/DISS-250-MITT-148] N80-20975
National geodetic survey data: Availability, explanation and application
[PB80-118615] N80-20977

GEODETIC COORDINATES
Determination of variations of time dependent coordinates through astronomical and Doppler observations N80-20649
The triangulation network in West Germany N80-20651
Improved tables of coordinates allotted to the Wetzell satellite tracking station N80-20692
The RGST chain program for the determination of potential coefficients and station coordinates N80-20702
The problem of obtaining data for the Digital Height Model N80-20707
Geodyn program systems development N80-20747
Information theory density distribution --- Earth Mantle N80-20753
Polar motion research N80-20755
A determination of GM N80-20756

GEODETIC SATELLITES
A survey of the geodetical work of the IFAG from 1952-1977 N80-20640
The satellite station Wetzell N80-20641
SFB 78/IFAG projects for laser measurement of distances to satellites N80-20642
Contributions of the SFB 78/IFAG to Doppler measurements for satellite positioning N80-20643
Participation of satellite observation station Wetzell in international observation programs, 1975-1977 N80-20646
Research program 78, satellite geodesy program
[ASTRON-GEODAET-ARB-38] N80-20691
Selection of a ruby laser for use as an illuminating laser for the BMK75 or as a reflecting laser for SRS N80-20693

GEODETIC SURVEYS
Reports on cartography and geodesy. Series 1: Original report no. 73
[REPT-73] N80-20638
National geodetic survey data: Availability, explanation and application
[PB80-118615] N80-20977

GEODYNAMICS
Geophisical atlas N80-20734
Crustal deformation: Crustal dynamics project N80-20736
Investigation of crustal dynamics using VLBI N80-20737
Crustal structure and dynamics of southeastern US --- Maryland, Virginia, North Carolina, South Carolina, West Virginia, Georgia, Tennessee, and Kentucky N80-20738
Plate boundary deformation in California --- Southern California: Elsinore, Earthquake Valley, and San Felipe Faults N80-20739
On the slection of station sites for observing strain streps and earthquake forerunners in California N80-20740
Earthquake and crustal deformation studies --- San Francisco and Fort Ross, California N80-20743
Global intra-plate volcanism N80-20744
Development of A seismic data collection platform N80-20745
Mantle convection and subcrustal stress N80-20752
The enhanced nodal equilibrium ocean tide and polar motion N80-20754
Polar motion research N80-20755
The spaceborne laser ranging system N80-20785

GEOGRAPHY
The international world map 1:1,000,000 (IWK) N80-20663

GEOIDS
Contributions to the determination of the geoid in West Germany N80-20650
Interpretation of geoid anomalies in the vicinity of subduction zones --- Tonga-Kermadec and the New Hebrides island arc, North Fiji, South Fiji and Lau-havre N80-20732
Astrogravimetric determination of the geoid
[SER-C/DISS-247-MITT-147] N80-20974

GEOLOGICAL FAULTS
Geological/geophysical resource assessment --- Rio Grande rift N80-20725
Regional Modeling: The Kentucky anomaly N80-20730
Comparative planetology/crustal evolution N80-20735
Crustal deformation: Crustal dynamics project N80-20736
Plate boundary deformation in California --- Southern California: Elsinore, Earthquake Valley, and San Felipe Faults N80-20739
Earthquake and crustal deformation studies --- San Francisco and Fort Ross, California N80-20743

GEOLOGICAL SURVEYS
Nevada nuclear waste storage investigations
[NVO-196-11] N80-21129

GEOMAGNETIC LATITUDE
Crustal anomaly representation N80-20728

GEOMAGNETISM
Magnetic field modeling and crustal studies N80-20726
Spherical harmonic models of the core field N80-20727
Crustal anomaly representation N80-20728
Anomaly verification: Comparison of Pogo magnetic data with aeromagnetic measurements N80-20729
Regional Modeling: The Kentucky anomaly N80-20730
Regional modeling: The Ivrea zone --- Northern Italy N80-20731
Observations of position, ocean depth, ice rotation, magnetic declination and gravity taken at the FRAM 1 drifting ice station
[AD-A077063] N80-20966

GEOMORPHOLOGY
Comparative planetology/crustal evolution N80-20735
Marine geology and tectonic evolution of the northwestern margin of the California continental borderland N80-20959
Geomorphology of Martian valleys N80-21232

GEOPHYSICAL OBSERVATORIES
The 25 years at the Institute for Applied Geodesy N80-20639
A survey of the geodetical work of the IFAG from 1952-1977 N80-20640
The satellite station Wetzell N80-20641
Research on gravimetry at IFAG N80-20653
Research program 78, satellite geodesy program
[ASTRON-GEODAET-ARB-38] N80-20691
Extending the Neodymium-YAG laser reflectance measuring system to lunar measurements at the Wetzell station N80-20695

GEOPHYSICS
Initial-value problems in stratified shear flows --- geophysics
[AD-A079525] N80-20542
Earth Survey Applications Division: Research leading to the effective use of space technology in applications relating to the Earth's surface and interior
[E80-10084] N80-20722
Earth survey applications division: Research leading to the effective use of space technology in applications relating to the Earth's surface and interior
[E80-10087] N80-20723
Regional modeling: The Ivrea zone --- Northern Italy N80-20731
Geophisical atlas N80-20734
Information theory density distribution --- Earth Mantle N80-20753
A determination of GM N80-20756
Observations of position, ocean depth, ice rotation, magnetic declination and gravity taken at the FRAM 1 drifting ice station
[AD-A077063] N80-20966

GEOPOTENTIAL
Geological/geophysical resource assessment --- Rio Grande rift N80-20725
Spherical harmonic models of the core field N80-20727
Global geology and geophysics using satellite-derived data N80-20733
Gravity model development N80-20748

GEORGIA
Crustal structure and dynamics of southeastern US --- Maryland, Virginia, North Carolina, South Carolina, West Virginia, Georgia, Tennessee, and Kentucky N80-20738
Hydrographic observations in the Georgia Bight (April 1978)
[PB80-111453] N80-21012

GEOS 3 SATELLITE
Mean sea surface computation using GEOS-3 altimeter data N80-20760
Interactive digital satellite image processing system for oceanographic applications
[AD-A079697] N80-20790

GEOTHERMAL ENERGY CONVERSION
Geothermal energy market penetration: Development of a model for the residential section
[PB80-118359] N80-21198

GEOTHERMAL RESOURCES
Assessment of low- to moderate-temperature geothermal resources of Nevada
[NVO-01556-1] N80-20792

GERMANIUM
Application of germanium detectors to environmental monitoring
[PB80-113624] N80-20936
Load relaxation and transmission electron microscopy studies of germanium N80-21169

GERMANY
Contributions to the determination of the geoid in West Germany N80-20650
The triangulation network in West Germany N80-20651
Research on gravimetry at IFAG N80-20653
Reports on cartography and topographical measurements. Series 1: Original report no. 74
[REPT-74] N80-20674
Twenty-five years of aerial photography by the Institute of Applied Geodesy N80-20676

The German-Austrian Doppler Observation Campaign N80-20696

GLASS
Low temperature thermal conductivities of glassy carbons
[COO-1198-1280] N80-20323
Structure and properties of glasses --- beryllium fluoride glass
[AD-A080071] N80-20400
Inorganic spark chamber frame and method of making the same
[NASA-CASE-GSC-12354-1] N80-20565
Remote experimental facility to solidify SRP high-level waste
[DP-MS-79-53] N80-21128
Temperatures generated by underground storage of defense waste canisters
[DP-MS-79-37] N80-21135

GLASS FIBER REINFORCED PLASTICS
Damping of anisotropic composites studied from the properties of the rolled components
[ILR-41] N80-20324
Report on the acoustic emission examination of glass-fiber-reinforced plastic pipes
[UCRL-TRANS-11520] N80-20604

GLASS FIBERS
Use of Glass Reinforced Concrete (GRCD) as a substrate for photovoltaic modules
[NASA-CR-162898] N80-20819

GLIDE PATHS
Computer modeling of terrain effects on Instrument Landing System (ILS) glide slope systems
[AD-A078228] N80-20252

GLOBAL POSITIONING SYSTEM
Simulation of a navigator algorithm for a low-cost GPS receiver
[NASA-TM-81778] N80-20251
Combined pseudo range and Doppler positioning for the stationary NAVSTAR user
[AD-A079543] N80-20256
NAVSTAR GPS civil applications study
[AD-A078277] N80-20257

GLYCEROLS
Glycerol test in diagnosing increased intralabyrinth pressure
[NASA-TM-76110] N80-21022

GOLD
Production of thin film networks which utilize chrome-gold conductors
[BDX-613-2257] N80-20503

GOVERNMENTS
Priority R and D needs of urban America, resource document
[PB80-106164] N80-21215

GRAIN BOUNDARIES
Subgrain refinement strengthening in stainless steel alloys N80-20368
Grain-boundary diffusion: Structural effects, models and mechanisms
[CONF-7909100-1] N80-20387
Energy of 100 coincidence twist boundaries in transition metal oxides
[CONF-7907101-2] N80-21179
Mechanical properties of crystalline solids --- transient deformation, grain boundary, sliding, and grain boundary cavitation processes in Zircaloys
[COO-2172-29] N80-21180

GRAPH THEORY
Combinatorial problems of applied discrete mathematics
[AD-A079521] N80-21075
Nearly balanced incomplete block designs
[AD-A079726] N80-21094

GRAPHIC ARTS
Signs and display systems: Graphic design and human engineering. A bibliography with abstracts
[PB80-803158] N80-21031

GRAPHITE
High electrical resistivity carbon/graphite fibers
[NASA-CR-162909] N80-20312
Design, fabrication and test of graphite/polyimide composite joints and attachments for advanced aerospace vehicles
[NASA-CR-159110] N80-20316

GRAPHITE-EPOXY COMPOSITE MATERIALS
Development of LaRC 160/NR150B2 polyimide graphite hybrid composites --- for shuttle applications
[NASA-CR-159196] N80-20315
Analytical/experimental investigation of the instability of composite cylindrical panels
[AD-A079850] N80-20628

GRAPHS (CHARTS)
Nearly balanced incomplete block designs
[AD-A079726] N80-21094

GRASSES
A spectral method for determining the percentage of green herbage material in clipped samples N80-20780
Evaluation of a spectral method for percentage green determination using clipped rangeland forage samples --- Texas N80-20781

GRASSLANDS
Monitoring drought in Colorado with LANDSAT MSS N80-20770
Radiometric resolution for monitoring vegetation: How many bits are needed? N80-20777
Major uses of land in the United States, 1974
[PB80-114226] N80-20796

GRATINGS (SPECTRA)
Diffractoid grating configuration for X-ray and ultraviolet focusing
[NASA-CASE-GSC-12357-1] N80-21140

GRAVIMETRY
A survey of the geodetical work of the IFAG from 1952-1977 N80-20640
Earth tides N80-20652
Research on gravimetry at IFAG N80-20653
GSFC site stability N80-20741
Gravity model development N80-20748
Astrogravimetric determination of the geoid
[SER-C/DISS-247-MITT-147] N80-20974

GRAVITATIONAL CONSTANT
A determination of GM N80-20756

GRAVITATIONAL EFFECTS
LeRC reduced gravity fluid management technology program
[NASA-TM-81450] N80-20304

GRAVITATIONAL FIELDS
Gravity model improvement for SEASAT N80-20749
The gravity field in the central pacific from satellite-to-satellite tracking and implications for mantle convection N80-20750
Mantle convection and subcrustal stress N80-20752
Differential geometry applied to geodesy in the case of the gravity field of the earth
[SER-C/DISS-250-MITT-148] N80-20975
To the solar foci --- design of experiments to study effect of the solar foci gravity waves and gravitational fields N80-21236

GRAVITY ANOMALIES
Anomaly verification: Comparison of Pogo magnetic data with aeromagnetic measurements N80-20729
Regional Modeling: The Kentucky anomaly N80-20730
Regional modeling: The Ivrea zone --- Northern Italy N80-20731
Global geology and geophysics using satellite-derived data N80-20733
Gravity model development N80-20748
The gravity field in the central pacific from satellite-to-satellite tracking and implications for mantle convection N80-20750

GRAVITY GRADIOMETERS
Modeling and error analysis of a superconducting gravity gradiometer N80-20557

GRAVITY WAVES
Finite-amplitude solitary water waves
[AD-A079718] N80-20546
A study of magnetogravity waves N80-20955
To the solar foci --- design of experiments to study effect of the solar foci gravity waves and gravitational fields N80-21236

GRAZING INCIDENCE
Diffractoid grating configuration for X-ray and ultraviolet focusing
[NASA-CASE-GSC-12357-1] N80-21140

GREEN FUNCTION
Dynamic Green's functions for layered media and applications to boundary-value problems --- for earthquake engineering in viscoelastic media N80-20431
Nonlinear diffraction theory by an eigenfunction expansion of the Green's function --- for surface gravity wave action on a circular cylinder N80-21058

GREEN WAVE EFFECT
Off-nadir viewing effects on spectral assessment of green biomass N80-20772
Assessing soybean leaf area and leaf biomass by spectral measurements --- Beltsville, Maryland Agricultural Research Center N80-20775

GREENLAND
Crustal anomaly representation N80-20728

GRINDING (MATERIAL REMOVAL)
Grinding and polishing articles in bulk: Burnishing
[NASA-TM-75774] N80-20590

GROUND EFFECT (AERODYNAMICS)
Ground plane effects on a contoured surface at low subsonic velocities
[AD-A079877] N80-20237

GROUND STATE
Ground states and magnetic responses of model valence-fluctuation systems
[LA-UR-79-3144] N80-21176

GROUND STATIONS
Minicomputer controlled system for testing telemetry receiving and recording systems
[AD-A078803] N80-20305
Biomedical communications experiments. Using the communications technology satellite: Technical evaluation
[PB80-111016] N80-20476

GROUND SUPPORT SYSTEMS
Airport ground access
[AD-A068974] N80-20284

GROUND-AIR-GROUND COMMUNICATIONS
Satellite personal communications system
[NASA-CASE-NPO-14480-1] N80-20448

GUIDANCE SENSORS
Improved Sun-sensing guidance system for high-altitude aircraft
[NASA-CASE-FRC-11052-1] N80-20249

GULF OF CALIFORNIA (MEXICO)
Crustal motion measurements in California (SAFE) N80-20746

GULF OF MEXICO
Environmental assessment of an active oil field in the northwestern Gulf of Mexico, 1977 - 1978. Volume 3: Chemical and physical investigations
[PB80-107899] N80-20939
National winter storms operations plan
[PB80-118425] N80-21000

GULF STREAM
Ocean circulation N80-20761

GYROSCOPES
Evaluation of packaging for the CN-1325/ASN-108 AHRS displacement gyro, F-15 aircraft
[AD-A078707] N80-20264
Passive fiber optic gyro study
[AD-A079471] N80-20566

H

H LINES
The structure and dynamics of H2 regions N80-21229

HAIL
The hailpad: Construction and materials data reduction, and calibration
[PB80-103989] N80-21001

HALIDES
Zinc halide hydrocracking process for distillate fuels from coal
[FE-1743-68] N80-20426

HALOCARBONS
Formulation of a preliminary assessment of halogenated organic compounds in man and environmental media
[PB80-112170] N80-21029

HALOGEN COMPOUNDS
Direct observation of the reactions of the atom O(1D) with halogen compounds of methane and with methane and water
[MPIS-25/1978] N80-21125

HAMILTONIAN FUNCTIONS
On subharmonic solutions of Hamiltonian systems
[AD-A079729] N80-21073

HARDWARE
Guidelines for evaluation of minicomputer hardware and software: A users perspective
[AD-A078460] N80-21039

HARMONIC ANALYSIS
Gravity model improvement for SEASAT N80-20749

HARMONIC GENERATIONS
Efficient high energy infrared third harmonic generation in gases and liquids for laser fusion applications --- carbon dioxide lasers
[COO-4251-7] N80-20581
HARMONIC MOTION
Steady motions exhibited by Duffing's equation: A picture book of regular and chaotic motions
[IPPJ-434] N80-21155
HARMONIC OSCILLATION
Oscillating flow about tube bundles
[AD-A078269] N80-20534
HASTELLOY (TRADEMARK)
Fatigue crack propagation in Hastelloy X weld metal
[ORNL/TM-6999] N80-20386
HAWAII
The gravity field in the central pacific from satellite-to-satellite tracking and implications for mantle convection N80-20750
Information theory density distribution --- Earth Mantle N80-20753
HAY
Monitoring drought in Colorado with LANDSAT MSS N80-20770
Evaluation of a spectral method for percentage green determination using clipped rangeland forage samples --- Texas N80-20781
HAZARDS
An assessment of the risks presented by carbon fiber composites released from motor vehicle fires
[NASA-CR-159207] N80-20311
Mod 1 wind turbine generator failure modes and effects analysis
[NASA-CR-159494] N80-20864
HEART
Effects of hypokinesia and hypodynamia on the intraorganic arteries of the heart
[NASA-TM-76069] N80-21026
HEART FUNCTION
Initial dynamics of the EKG during an electrical defibrillation of the heart
[NASA-TM-76002] N80-21019
HEAT CAPACITY MAPPING MISSION
Heat Capacity Mapping Mission (HCMM) --- australia
[E80-10066] N80-20721
HEAT MEASUREMENT
Electrical, thermal and abusive tests on lithium thionyl chloride cells N80-20829
NASA 50 amp hour nickel cadmium battery waste heat determination N80-20842
HEAT PIPES
Heat pipes: Properties of common small-pore wicks
[ESDU-79013] N80-20512
The LDEF heat pipe experiment power systems N80-20843
HEAT PUMPS
Heat-pump-centered integrated community energy systems: System development
[ANL/CNSV-TM-8] N80-20880
Performance of heat pumps at elevated evaporating temperatures with application to solar input
[BNL-26772] N80-20896
HEAT RESISTANT ALLOYS
An experimental, low-cost, silicon-aluminide high-temperature coating for superalloys
[NASA-TM-81455] N80-20370
Characterization of casting defects in typical castings of a directionally solidified superalloy
[AD-A077270] N80-20376
HEAT STORAGE
Numerical simulation of dual-media thermal energy storage systems
[SAND-78-2282] N80-20875
Evaluation of a sulfur oxide chemical heat storage process for a steam solar electric plant
[LBL-7868-REV] N80-20890
Economics of thermal energy storage for compressed air energy storage systems
[PNL-SA-7949] N80-20903
Economics of compressed air energy storage employing thermal energy storage
[PNL-3191] N80-20904
HEAT TRANSFER
Pavement recycling-bituminous concrete and concrete mix designs
[PB80-106263] N80-20443
Experimental and theoretical investigations of heat transfer between a gas-solid fluidized bed and immersed tubes N80-20514
Numerical simulation of dual-media thermal energy storage systems
[SAND-78-2282] N80-20875
Thermal fluid selection for long-distance heat transmission
[CONF-790803-47] N80-20879
Interferometric study of the natural convection characteristics of flat plate, slat and vee-corrugated solar collectors
[COO-2971-6] N80-20900
HEAT TRANSMISSION
Technique for measuring the apparent thermal conductivity of flat insulation
[ORNL/TM-6494] N80-20549
HEAT TREATMENT
Effect of heat treatment on fracture of type 304L stainless steel in a hydrogen environment
[DP-MS-79-18] N80-20384
HEATING EQUIPMENT
Portable heatable container
[NASA-CASE-NPO-14237-1] N80-20808
HEAVY IONS
Physics with fast molecular-ion beams
[ANL/PHY-79-3] N80-21115
HEIGHT
Digital height model with ITEK correlator N80-20669
HELICOPTER PERFORMANCE
Preliminary airworthiness evalaution, AH-1G with the airborne target acquisition fire control system and the hellfire modular missile system installed
[AD-A078340] N80-20265
HELICOPTER WAKES
Operational implications of some NACA/NASA rotary wing induced velocity studies
[NASA-TM-80232] N80-20231
HELICOPTERS
Rotocraft flight simulation, computer program C81. Volume 3: Programmer's manual
[AD-A077345] N80-20262
HELIUM HYDROGEN ATMOSPHERES
Method and means for helium/hydrogen ratio measurement by alpha scattering
[NASA-CASE-NPO-14079-1] N80-20334
HELMETS
A direct measure of CRT image quality
[AD-A075610] N80-21146
HETERODYNING
Transient response of a heterodyne receiver: Implications for a time-of-arrival system
[AD-A078373] N80-20469
HEURISTIC METHODS
Documentation of a computer program for Hilliers heuristic procedure in integer linear programming
[AD-A075576] N80-21048
Local search for the asymmetric traveling salesman problem
[PB80-118532] N80-21096
HF LASERS
Hydrogen fluoride and deuterium fluoride lasers, Volume 2. A bibliography with abstracts, 1976-1979
[PB80-803273] N80-20586
HIGH ENERGY ELECTRONS
Substorm-related VLF chorus events: Local-time dependence and relationship to newly-injected clouds of drifting energetic electrons N80-20450
HIGH ENERGY INTERACTIONS
High energy particle physics research
[SAN-0034-191-T1] N80-21136
Research program in theoretical high-energy physics
[COO-3130TA-347] N80-21137
Parity nonconservation in polarized electron scattering at high energies
[SLAC-PUB-2409] N80-21173
HIGH FREQUENCIES
A model of natural HF radio noise in severely disturbed propagation environments
[AD-A077619] N80-20474
Lump partitioning of integrated-circuit bipolar transistor models for high-frequency applications N80-20482
HIGH POWER LASERS
Investigation of Hg2 as a discharge pumped optical storage medium
[COO-4630.A000-1] N80-20582
HIGH PRESSURE
Chemical and physical stability of refractories for use in coal gasification
[COO-2904-14] N80-20429
Effects of high pressure on molecular electronic spectra. 2: Morse-potential formulation
[AD-A079898] N80-21109
High pressure photophysics of organic molecules
[COO-1198-1278] N80-21113
HIGH RESOLUTION
Investigation of in situ composites for electromagnetic device applications with emphasis on development of microwave tube cathodes and high resolution displays
[AD-A079698] N80-20321
HIGH STRENGTH STEELS
Reliability of energy dispersive X-ray fluorescence analysis of low-alloy steels
[AD-A077154] N80-20371
Correlations between fracture toughness and microstructure in 4140 steel, MRL E-113
[COO-3084-67] N80-20379
HIGH TEMPERATURE
Aerothermal evaluation of high-temperature structural materials for use in high-performance missile design
[AD-A080023] N80-20319
Development of a procedure for estimating the high cycle fatique strength of some high temperature structural alloys
[BNL-NUREG-26085] N80-20378
Composite wall concept for high temperature turbine shrouds: Survey of low modulus strain isolator materials
[NASA-TM-81443] N80-20398
Chemical and physical stability of refractories for use in coal gasification
[COO-2904-14] N80-20429
HIGH TEMPERATURE GASES
Hot gas cleanup process
[PB80-108467] N80-20950
HIGH TEMPERATURE PLASMAS
Proceedings of USSR-Japan Joint Seminar on Plasma Diagnostics
[IPPJ-438] N80-21154
HIGH VOLTAGES
Determining the mode of high voltage breakdowns in vacuum devices
[GEPP-OP-469] N80-20504
HIGHWAYS
Airport ground access
[AD-A068974] N80-20284
Statistical investigation of pavement skid resistance data
[PB80-116114] N80-20446
HIMALAYAS
Geophisical atlas N80-20734
HISTORIES
The Apollo spacecraft: A chronology volume 4, 21 January 1966 - 13 July 1974
[NASA-SP-4009] N80-20437
HOLOGRAPHIC INTERFEROMETRY
Holographic interferometric survey of boundary layer transition in an axisymmetric free convection thermal boundary layer
[AD-A079880] N80-20567
HOLOGRAPHY
Some aspects of block quantization with applications to source coding and digital holography N80-20562
Investigation of direct integrated optics modulators --- applicable to data preprocessors
[NASA-CR-162894] N80-21143
HOMING DEVICES
Multienvironment active RF seeker test and evaluation program, MARFS test
[AD-A078161] N80-20455
HOMOLOGY
Homological indices and homotopy continuation N80-21056
HOMOTOPY THEORY
Homological indices and homotopy continuation N80-21056
HORMONES
Plasma cortisol levels and auditory functioning in humans exposed to short and prolonged durations of noise N80-21018
HOT ELECTRONS
Formation of toroidal plasma confinement configuratons by using hot electrons
[UCID-18239] N80-21161

HOT PRESSING
Influence of purity level on the mechanical properties of hot isostatically pressed beryllium
[SAND-79-8232] N80-20377
HOT-WIRE ANEMOMETERS
Hot wire anemometer investigation of turbulence levels and development of liquid crystal flow visualization techniques for the rectilinear cascade test facility
[AD-A078284] N80-20533
HUMAN FACTORS ENGINEERING
Distance estimation from cognitive maps
[AD-A080096] N80-20788
Signs and display systems: Graphic design and human engineering. A bibliography with abstracts
[PB80-803158] N80-21031
Human comfort response to dominant random motions in longitudinal modes of aircraft motion
[NASA-CR-159186] N80-21033
Research on new electronic display technologies
[AD-A079323] N80-21035
Establishment of the repeatability of performance of the SA103C three year old child test dummies
[PB80-112204] N80-21036
HUMIDITY
Meteorological data, series A monographs. Volume 3, no. 1: A study of prediction of characteristic synoptic structures with the aid of a numerical model of the humid atmosphere N80-20984
HURRICANES
Meteorological criteria for standard project hurricane and probable maximum hurricane windfields, gulf and east coasts of the United States
[PB80-117997] N80-20999
HYBRID PROPULSION
Beamed energy coupling studies
[AD-A080037] N80-20578
HYDRAULIC EQUIPMENT
Cavitation induced instabilities associated with turbomachines N80-20519
Hydraulic diagnostic monitoring system
[AD-A077552] N80-20594
HYDROCARBON FUELS
Flame propagation, autoignition and combustion in alcohol-petroleum-air mixtures and other alternative fuels
[COO-4486-5] N80-20420
HYDROCARBONS
Evaluation of sensitized fluorescence for polynuclear aromatic hydrocarbon detection --- in combustion products
[PB80-108475] N80-20358
Characterization and analysis of devonian shales as related to release of gaseous hydrocarbons
[ORO-5205-10] N80-20973
HYDROCRACKING
Zinc halide hydrocracking process for distillate fuels from coal
[FE-1743-68] N80-20426
HYDRODYNAMICS
The effects of pitching rate on the hydrodynamic properties of hydrofoils
[AD-A079810] N80-20438
Recent developments in computational techniques for applied hydrodynamics
[AD-A079305] N80-20539
Nonlinear diffraction theory by an eigenfunction expansion of the Green's function --- for surface gravity wave action on a circular cylinder N80-21058
HYDROFOILS
The effects of pitching rate on the hydrodynamic properties of hydrofoils
[AD-A079810] N80-20438
HYDROGEN
Advanced development of a short-residence-time hydrogasifier
[FE-3125-5] N80-20414
Coal liquefaction with synthesis gas
[PETC/TR-79/1] N80-20416
Generation of 16 micron radiation using stimulated rotational Raman scattering in hydrogen --- using a CO2 TEA laser N80-20573
HYDROGEN ATOMS
Atomic hydrogen storage --- cryotrapping and magnetic field strength
[NASA-CASE-LEW-12081-2] N80-20402
HYDROGEN EMBRITTLEMENT
Effect of heat treatment on fracture of type 304L stainless steel in a hydrogen environment
[DP-MS-79-18] N80-20384
The effect of plastic deformation on the transport of hydrogen in nickel
[AD-A077660] N80-20391
HYDROGEN FUELS
Hydrogen storage for automobiles
[BNL-26906] N80-20886
HYDROGEN OXYGEN FUEL CELLS
Lightweight fuel cell powerplant components program
[NASA-CR-161412] N80-20306
Feasibility of cogeneration application of a 4.8 MW fuel cell power plant at a Santa Clara, California paper mill
[SAN-2189-T1] N80-20876
HYDROGEN PRODUCTION
Coal liquefaction test center
[FE-1517-78] N80-20425
HYDROGENATION
Kinetics and mechanisms of catalytic hydroliquefaction and hydrogasification of lignite
[FE-2702-7] N80-20421
Coal liquefaction test center
[FE-1517-78] N80-20425
HYDROGEOLOGY
Heat Capacity Mapping Mission (HCMM) --- australia
[E80-10066] N80-20721
HYDROGRAPHY
Hydrographic observations in the Georgia Bight (April 1978)
[PB80-111453] N80-21012
HYDROLOGY
International symposium on urban hydrology: Proceedings of two special sessions, spring annual meeting, American Geophysical Union
[PB80-123078] N80-20805
HYDROLOGY MODELS
Waste isolation safety assessment program. A brief description of the three-dimensional finite element ground-water flow model adapted for waste isolation safety assessments
[PNL-2652] N80-21131
Sensitivity on the parameters of the regional hydrology model for the Nevada nuclear waste storage investigations
[SAND-79-1197C] N80-21132
HYDROMETEOROLOGY
Hydrometeorological characteristics of severe rainstorms in Illinois
[PB80-110406] N80-20997
HYDROPHONES
PARRAY technical papers presented at scientific and technical meetings
[AD-A077726] N80-21104
HYDROXIDES
The practical limit of loading nickel hydroxide electrodes N80-20857
HYPERBOLIC DIFFERENTIAL EQUATIONS
On efficient time-stepping methods for nonlinear second order hyperbolic partial differential equations
[AD-A079731] N80-21074
HYPERBOLIC FUNCTIONS
Closed-loop eigenvalue specification for infinite dimensional systems augmented and deficient hyperbolic cases
[AD-A079727] N80-21053
HYPERSPACES
General least-squares fitting procedures to minimize the volume of a hyperellipsoid
[LA-8096-MS] N80-21081
HYPERTHERMIA
Cold shivering activity after unilateral destruction of the vestibular apparatus
[NASA-TM-76099] N80-21021
HYPERVELOCITY PROJECTILES
Real-gas effects on the aerodynamics of blunt cones as measured in a hypervelocity range
[AD-A075526] N80-20241
The particle dynamics of target penetration
[AD-A077114] N80-20592
HYPODYNAMIA
Coagulating activity of the blood, vascular wall, and myocardium under hypodynamia conditions
[NASA-TM-76056] N80-21023
Effects of hypokinesia and hypodynamia on the intraorganic arteries of the heart
[NASA-TM-76069] N80-21026
HYPOKINESIA
Adrenocortical response in rats subjected to a stress of restraint by immobilization whether accompanied by hypothermia or not
[NASA-TM-76119] N80-21015
Atherosclerotic changes of vessels caused by restriction of movement
[NASA-TM-76022] N80-21020
Effects of hypokinesia and hypodynamia on the intraorganic arteries of the heart
[NASA-TM-76069] N80-21026
HYPOTHERMIA
Adrenocortical response in rats subjected to a stress of restraint by immobilization whether accompanied by hypothermia or not
[NASA-TM-76119] N80-21015

I

I BEAMS
Web distortion and flexural-torsional buckling
[PB80-116221] N80-20444
ICE FORMATION
Airflow effects on riming measurements by a wing tip-mounted ice detector on the MC130E research airplane
[AD-A077019] N80-20244
Snow and ice accumulation at solar collector installations in the Chicago metropolitan area
[PB80-113749] N80-20912
ICE NUCLEI
Airflow effects on riming measurements by a wing tip-mounted ice detector on the MC130E research airplane
[AD-A077019] N80-20244
IGNEOUS ROCKS
Perlite: Mineral commodity profiles
[PB80-111362] N80-20359
IGNITION
Theoretical and computational approach to modeling flame ignition
[AD-A079306] N80-20347
IGNITION TEMPERATURE
Thermal initiation of high explosives with an electron beam
[AD-A077535] N80-20408
ILLINOIS
Hydrometeorological characteristics of severe rainstorms in Illinois
[PB80-110406] N80-20997
IMAGE CONTRAST
On spectral signatures in central perspective representation N80-20665
Image properties of an X-ray telescope of the Wolter-1 type with emphasis on contrast reduction by diffuse reflection
[NASA-TM-75805] N80-21224
IMAGE CONVERTERS
Solid-state amplifiers and image converters
[BLL-RTS-11799] N80-20480
IMAGE CORRELATORS
Digital height model with ITEK correlator N80-20669
IMAGE INTENSIFIERS
Particle diagnostics using Mie scattering and image intensification techniques --- to analyze particles in exhaust emission
[AD-A079888] N80-20541
IMAGE PROCESSING
Image understanding research
[AD-A078034] N80-20454
Tasks and possibilities of digital image data processing in photogrammetry N80-20672
Linear array pushbroom radiometer data analysis N80-20784
Interactive digital satellite image processing system for oceanographic applications
[AD-A079697] N80-20790
Region representation raster-to-quadtree conversion
[AD-A078086] N80-21046
Shape segmentation using relaxation
[AD-A078084] N80-21060
Computing perimeters of images represented by quadtrees
[AD-A078083] N80-21061
IMAGE RECONSTRUCTION
Image understanding research
[AD-A078034] N80-20454

IMAGE RESOLUTION
A direct measure of CRT image quality
[AD-A075610] N80-21146
IMAGING TECHNIQUES
Basic research in three-dimensional imaging from transient radar scattering signatures
[AD-A079423] N80-20462
Experimental Image Compression Subsystem (EICS) communication testing
[AD-A077546] N80-20470
The future of analytical evaluation equipment --- image measurement techniques N80-20670
Region representation raster-to-quadtree conversion
[AD-A078066] N80-21046
Computing perimeters of images represented by quadtrees
[AD-A078083] N80-21061
Diffractoid grating configuration for X-ray and ultraviolet focusing
[NASA-CASE-GSC-12357-1] N80-21140
The rotation of the Sun: Observations at Stanford --- using the Doppler effect
[NASA-CR-162914] N80-21240
IMMUNOLOGY
On the cellular autoimmune mechanism for eliminating erythrocytes normally and under extreme influences
[NASA-TM-75735] N80-21014
IMPACT DAMAGE
Impact craters from centimeters to megameters
N80-21233
IMPLOSIONS
Stability of self-similar flow: Uniform implosion of an ablatively driven shell
[AD-A079890] N80-20540
INCOMPRESSIBLE FLOW
Recent developments in computational techniques for applied hydrodynamics
[AD-A079305] N80-20539
Numerical solution of the two-dimensional incompressible averaged Navier-Stokes equations for finite arbitrary shaped isolated bodies, part 1
[AD-A080093] N80-20544
INCOMPRESSIBLE FLUIDS
Dynamics of flexible rotors partially filled with a viscous incompressible fluid N80-20513
INDUCTION MOTORS
Development and evaluation of a model doubly-fed machine
[PB80-100662] N80-20916
INDUSTRIAL ENERGY
Industrial fuel choice analysis model. Volume 2: Appendices to model documentation
[DOE/EIA-2832/1-VOL-2-APP] N80-20419
Energy conservation in the US: Some interdisciplinary approaches with an emphasis on industrial cogeneration N80-20811
Feasibility of cogeneration application of a 4.8 MW fuel cell power plant at a Santa Clara, California paper mill
[SAN-2189-T1] N80-20876
Industrial Sector Technology Use Model (ISTUM): Industrial energy use in the United States, 1974 - 2000. Volume 2: Results
[DOE/FE-2344/2] N80-20885
INDUSTRIAL PLANTS
Aerospace electrode line N80-20859
INDUSTRIAL SAFETY
American National Standard N538-1979 classification of industrial ionizing radiation gauging devices --- safety aspects
[PB80-11012] N80-20569
INDUSTRIAL WASTES
Development of a biological simulation monitor for joint municipal/industrial treatment systems
[PB80-111032] N80-20951
Treatment of organic chemical manufacturing wastewater for reuse
[PB80-105166] N80-21217
INDUSTRIES
Perlite: Mineral commodity profiles
[PB80-111362] N80-20359
Molybdenum: Mineral commodity profiles
[PB80-110885] N80-20392
Lithium: Mineral commodity profiles
[PB80-123011] N80-20799
Marketing and market acceptance data from the Residential Solar Demonstration Program. Volume 1: Detailed analysis, autumn 1979
[PB80-115298] N80-21197
INELASTIC COLLISIONS
Angular momentum transfer in deeply inelastic collisions
[RLO-1388-395] N80-21111
Measures of the transverse differential effect for the rotary excitation of the molecule HD colliding with Ne and D2
[MPIS-16/1978] N80-21124
INELASTIC SCATTERING
Extremal effects in rotationally inelastic diffraction
[AD-A077151] N80-20342
Deep inelastic muon scattering at Fermi Lab --- using a multimuon spectrometer
[COO-3000-T2] N80-21122
Parity violation in deep inelastic electron scattering
[SLAC-PUB-2432] N80-21178
INERTIA
Inertia and friction welding of aluminum alloy 1100 to type 316 stainless steel
[Y-2165-REV] N80-20596
INERTIAL FUSION (REACTOR)
Material implications of design and system studies for inertial confinement fusion systems
[UCRL-82041] N80-21163
INERTIAL GUIDANCE
Inertial navigation and guidance, volume 2. A bibliography with abstracts
[NTIS/PS-79/0762/9] N80-20259
INERTIAL NAVIGATION
Inertially augmented approach couplers
[AD-A080488] N80-20248
Inertial navigation and guidance, volume 2. A bibliography with abstracts
[NTIS/PS-79/0762/9] N80-20259
INFESTATION
Earth Survey Applications Division: Research leading to the effective use of space technology in applications relating to the Earth's surface and interior
[E80-10084] N80-20722
Earth survey applications division: Research leading to the effective use of space technology in applications relating to the Earth's surface and interior
[E80-10087] N80-20723
Remote monitoring of forest cover conditions --- deciduous tree defoliation in Pennsylvania
N80-20763
INFORMATION DISSEMINATION
Interpolation and data fitting with splines
[UCID-18329] N80-21083
The impact of behavioral and technical information interventions on industrial R and D projects
[PB80-110265] N80-21194
INFORMATION MANAGEMENT
The impact of behavioral and technical information interventions on industrial R and D projects
[PB80-110265] N80-21194
INFORMATION SYSTEMS
Adaptive estimation of information values in continuous decision making and control of advanced aircraft
[AD-A077917] N80-20281
INFORMATION THEORY
Digital-phase method of forming single sideband signals --- application to radio communication
[BLL-RTS-11857] N80-20449
Information theory density distribution --- Earth Mantle N80-20753
Combinatorial problems of applied discrete mathematics
[AD-A079521] N80-21075
Description of the Wharton/ODA system
[AD-A079601] N80-21191
Source coding with side information and universal coding
[PB80-108343] N80-21195
INFRARED DETECTORS
Signal processing circuit development
[AD-A079053] N80-20465
Passive infrared surveillance. Part 1: Model formulation
[AD-A075603] N80-21145
INFRARED IMAGERY
Remote sensing of leaf water content in the near infrared N80-20768
Plant stress and relationships to spectral responses --- cotton and tomato plants N80-20769
INFRARED LASERS
Beamed energy coupling studies
[AD-A080037] N80-20578
Investigation of Hg2 as a discharge pumped optical storage medium
[COO-4630.A000-1] N80-20582
INFRARED RADIATION
An improved model for the calculation of longwave flux at 11 micrometers --- satellite radiance measurements
[PB80-119431] N80-20981
INFRARED SPECTROSCOPY
Development of combustion diagnostics and applications to turbulent combustion
[AD-A079523] N80-20348
INLAND WATERS
Heat Capacity Mapping Mission (HCMM) --- australia
[E80-10086] N80-20721
INSTRUMENT ERRORS
The effect of sea state on altimeter measurements
N80-20759
INSTRUMENT LANDING SYSTEMS
Computer modeling of terrain effects on Instrument Landing System (ILS) glide slope systems
[AD-A078228] N80-20252
INTEGRAL TRANSFORMATIONS
Investigation of transform techniques for solving electromagnetic radiation and scattering problems
[AD-A077895] N80-20456
Energy release rate calculations for interface edge cracks based on a conservation integral
[AD-A079723] N80-20625
INTEGRATED CIRCUITS
The Art of Communications Interfaces; technology insertion in the C3I arena: Proceedings of the 4th Annual Seminar
[AD-A078344] N80-20471
Lump partitioning of integrated-circuit bipolar transistor models for high-frequency applications
N80-20482
Placement and routing algorithms for hierarchical integrated circuit layout N80-20486
GaAs analog integrated circuits (GaAs RF-LSI), phase 1. Volume 2: Appendices
[AD-A079589] N80-20496
GaAs analog integrated circuits (GaAs RF-LSI), volume 1 --- microwave receivers
[AD-A079588] N80-20497
Fabrication, characterization and optimization of poslet (PVF2-silicon) piezoelectric transducers for low frequency 100 Hz to 500 KHz underwater acoustic applications
[AD-A079113] N80-20500
INTEGRATED ENERGY SYSTEMS
Heat-pump-centered integrated community energy systems: System development
[ANL/CNSV-TM-8] N80-20880
Performance of heat pumps at elevated evaporating temperatures with application to solar input
[BNL-26772] N80-20896
INTEGRATED OPTICS
Investigation of direct integrated optics modulators --- applicable to data preprocessors
[NASA-CR-162894] N80-21143
INTELSAT 5 SATELLITE
The 20 watt-hour per kilogram nickel cadmium energy storage for Intelsat V N80-20844
Intelsat-V: Nickel-hydrogen battery N80-20861
INTERFEROMETERS
Velocity servo for continuous scan Fourier interference spectrometer
[NASA-CASE-NPO-14093-1] N80-20563
INTERNAL COMBUSTION ENGINES
Flame propagation, autoignition and combustion in alcohol-petroleum-air mixtures and other alternative fuels
[COO-4486-5] N80-20420
INTERNAL ENERGY
Energy of 100 coincidence twist boundaries in transition metal oxides
[CONF-7907101-2] N80-21179
INTERNATIONAL COOPERATION
Participation of satellite observation station Wetzell in international observation programs, 1975-1977
N80-20646

INTERPOLATION
Interpolation and data fitting with splines
[UCID-18329] N80-21083
INTERSTELLAR GAS
The high latitude extensions of galactic spiral arms --- of interstellar gas N80-21228
INTERSTELLAR MATTER
Interstellar matter and extragalactic light
N80-21225
INTERSTELLAR RADIATION
The structure and dynamics of H2 regions
N80-21229
ION BEAMS
Physics with fast molecular-ion beams
[ANL/PHY-79-3] N80-21115
Deflagration wave formed by ion beam. Part 3: With energy of direct fusion reaction
[IPPJ-435-PT-3] N80-21156
ION CONCENTRATION
Atmospheric transport of acidity in southern California by wet and dry mechanisms N80-20917
ION DENSITY (CONCENTRATION)
Validation of the Dairchem code 1: Quiet midlatitude conditions
[AD-A077880] N80-20965
ION IMPLANTATION
Ion implantation in perovskite type ferroelectrics
[AD-A080078] N80-20495
ION IRRADIATION
Crystallization and irradiation effects in an amorphous alloy of type Fe40Ni38Mo4B18
[PNL-TR-372] N80-20390
High power ion-irradiation test for CTR first wall --- using a plasma anode
[IPPJ-437] N80-21158
ION RECOMBINATION
Atomic and molecular processes
[AD-A079324] N80-21108
ION SCATTERING
ISS/SIMS characterization of UV/O sub 3 cleaned surfaces
[AD-A078425] N80-20375
ION TRAPS (INSTRUMENTATION)
Laser induced fluorescence of trapped molecular ions
[LBL-10021] N80-21114
IONIC COLLISIONS
Numerical study of current-driven collisional drift and alfven instabilities in a sheared magnetic field
[IPPJ-436] N80-21157
IONIZATION
Coherence in penning ionization and first kind collisions: Volume recombination of ions/electrons
[AD-A079742] N80-21107
IONIZING RADIATION
American National Standard N538-1979 classification of industrial ionizing radiation gauging devices --- safety aspects
[PB80-11012] N80-20569
Secondary electron radiation
[UCRL-TRANS-11465] N80-21112
IONOSPHERE
An investigation and analysis of the density and thermal balance of the Martian ionosphere
N80-21230
IONOSPHERIC DISTURBANCES
Review of ionospheric distrubances resulting from some naturally occuring events
[LA-7984-MS] N80-20970
IRON
Strain hardening of iron, axisymmetric vs plane strain elongation
[CONF-790801-5] N80-20380
Resource and energy constraints of regional and global availability of aluminum copper, and iron 1975 - 2000: A computer study N80-20720
IRON ALLOYS
Production of aluminum-silicon alloy and ferrosilicon and commercial purity aluminum by the direct reduction process, phase B
[CONS/5089-7] N80-20382
Crystallization and irradiation effects in an amorphous alloy of type Fe40Ni38Mo4B18
[PNL-TR-372] N80-20390
IRRIGATION
Monitoring drought in Colorado with LANDSAT MSS N80-20770
Effects of wheat irrigation frequency on reflectance in selected spectral bands --- Phoenix, Arizona
N80-20771
Water resources in arid and semiarid regions. A bibliography with abstracts
[PB80-80225#] N80-20795
ISLANDS
Information theory density distribution --- Earth Mantle N80-20753
ISOTROPIC MEDIA
Collisional effects on electrostatic waves in isotropic plasmas N80-21150
ISTHMUSES
Gravity model development N80-20748
ITALY
Regional modeling: The Ivrea zone --- Northern Italy N80-20731
ITERATION
An acquisition aid for a phase locked loop --- using an iterative technique N80-20485

J

J-85 ENGINE
Velocity profiles in a long inlet duct employing a photon correlating laser velocimeter without seeding
[AD-A079878] N80-20278
JAPAN
Proceedings of USSR-Japan Joint Seminar on Plasma Diagnostics
[IPPJ-438] N80-21154
JET ENGINE FUELS
Evaluation of fuel character effects on the F101 engine combustion system
[AD-A077860] N80-20405
Thermodynamics of organic compounds --- ramjet fuels
[AD-A080072] N80-20410
Stability survey of hydrocarbon fuels
[BETC-1778-4] N80-20424
JET ENGINES
Alternatives for jet engine control
[NASA-CR-162911] N80-20273
Aerosol filter loading data for a simulated jet engine test cell aerosol
[AD-A078779] N80-20287
JET MIXING FLOW
Laser-Raman measurements in a ducted, two-stream, subsonic, H2/air combustion flow
[AD-A078112] N80-20233
JOINTS (JUNCTIONS)
Design, fabrication and test of graphite/polyimide composite joints and attachments for advanced aerospace vehicles
[NASA-CR-159110] N80-20316
States of stress and strain in adhesive joints, including photoelastic imaging of defects in adherends
[AD-A079515] N80-20631
A recursive Lagrangian formulation of manipulator dynamics and a comparative study of dynamics formulation complexity
[AD-A078067] N80-21062
JUPITER ATMOSPHERE
Transport properties in the atmosphere of Jupiter
[NASA-CR-162897] N80-21234
JUPITER PROBES
Wake flowfields for Jovian probe
[NASA-CR-159235] N80-20230

K

KAONS
Kaon-proton backward elastic scattering between 476 and 1084 MeV/c
[LBL-8969] N80-21120
KENTUCKY
Statewide survey of skid resistances of pavements, 1978
[PB80-106404] N80-20442
Regional Modeling: The Kentucky anomaly
N80-20730
Crustal structure and dynamics of southeastern US --- Maryland, Virginia, North Carolina, South Carolina, West Virginia, Georgia, Tennessee, and Kentucky
N80-20739
KERNEL FUNCTIONS
On the use of lines of kernel functions for orbital determination N80-20701
KEVLAR (TRADEMARK)
Transverse compressive testing of thick Kevlar/epoxy laminates
[SAND-79-0176] N80-20322
KINEMATICS
Kinematics and dynamics of vortex rings in a tube
N80-20524
Instantaneous kinematics of multiple degree-of-freedom motions N80-21098
KINETIC THEORY
Determination of forces on arbitrary concave bodies in high speed rarefied gases
[LOG-J11513] N80-20530
KLYSTRONS
Multiband Klystron study
[AD-A078036] N80-20490
KURTOSIS
Studies of the statistical bias and signal characteristics of laser velocimeters
[AD-A079634] N80-20579

L

LABORATORIES
Reduction of the duration of restraint for the production of experimental ulcers in rats: Application to the study of protective substances
[NASA-TM-76136] N80-21016
LABYRINTH
Glycerol test in diagnosing increased intralabyrinth pressure
[NASA-TM-76110] N80-21022
LAGEOS (SATELLITE)
Unexplained Lageos perturbation N80-20751
LAGRANGE COORDINATES
Stabilizing an unstable orbit about L3 in the Sun, Earth, Moon system using linear constant gain feedback
[AD-A079860] N80-20292
LAGRANGE MULTIPLIERS
Abstract optimality theory
[AD-A079707] N80-21069
LAGRANGIAN EQUILIBRIUM POINTS
Determination of the minimum delta 5 transfer trajectory from a low Earth orbit to a stable orbit around the Lagrangian point L4 in a restricted four-body system
[AD-A079861] N80-20295
On the use of lines of kernel functions for orbital determination N80-20701
LAKE SUPERIOR
Optical detection of fiber particles in water --- Lake Superior
[PB80-116666] N80-21148
LAKES
Airborne laser fluorosensing of surface water chlorophyll a --- Lake Mead, Nevada
[PB80-113400] N80-20797
Public information and lake eutrophication: A case study of Gull Lake in southwestern Michigan
[PB80-113715] N80-20802
LAMBERT SURFACE
Improvement in classification accuracy of LANDSAT MSS data in areas of mountainous terrain
N80-20766
LAMINAR BOUNDARY LAYER
Computation of three-dimensional aerodynamic flow
[AD-A080073] N80-20240
Calculation of oblique-shock-wave laminar-boundary-layer interaction on a flat plate
[NASA-CR-159629] N80-20531
LAMINAR FLOW
Detection of the transitional layer between laminar and turbulent flow areas on a wing surface --- using an accelerometer to measure pressure levels during wind tunnel tests
[NASA-CASE-LAR-12261-1] N80-20224
Fluid flow through a partially filled cylinder --- laminar flow N80-20516
Pulsatile laminar flow separation in an exponentially diverging tube N80-20526
Three-dimensional laminar solution of the Navier-Stokes equations using body-fitted coordinate systems, part 2
[AD-A080046] N80-20543
Transition to turbulence in free shear-layers
[AD-A080066] N80-20547

LAMINAR HEAT TRANSFER
Two-dimensional, laminar, mixed (forced and free) convection, radiative diffusion flames N80-20333
LAMINATES
Transverse compressive testing of thick Kevlar/epoxy laminates
[SAND-79-0176] N80-20322
Fracture mechanics of bi-material interface cracks — the behavior of a metallic interface cracks N80-20611
LAND MANAGEMENT
Surface mine monitoring — Pennsylvania N80-20754
LAND USE
Obtaining surface information for topography and town and country planning from remote sensing N80-20668
Heat Capacity Mapping Mission (HCMM) — australia
[E80-10086] N80-20721
NASA-census Application Pilot Test (APT) and urban area delineation studies — Seattle, Washington; Austin, Texas; Orlando, Florida; Boston, Massachusetts, and Richmond, Virginia N80-20765
Major uses of land in the United States, 1974
[PB80-114226] N80-20796
Methodology for evaluating physical constraints on residential solar energy use
[UCRL-15001] N80-20901
LANDSAT D
LANDSAT-D assessment system N80-20782
LANDSAT SATELLITES
Application of LANDSAT imagery to monitor sand dunes movement in the Sahara Desert N80-20719
LANDSAT 2
Interactive digital satellite image processing system for oceanographic applications
[AD-A079697] N80-20790
LAP JOINTS
Finite-element analysis of problems involving stress singularities — including lap joints and elastic crack problems N80-20610
Use of two-dimensional transmission photoelastic models to study stresses in double-lap bolted joints. Load transfer and stresses in the inner lap
[VPI-E-80-9] N80-20621
LARGE SCALE INTEGRATION
GaAs analog integrated circuits (GaAs RF-LSI), phase 1. Volume 2: Appendices
[AD-A079589] N80-20496
GaAs analog integrated circuits (GaAs RF-LSI), volume 1 — microwave receivers
[AD-A079588] N80-20497
Automated synthesis of digital hardware modules. Simulation and verification of interconnections
[AD-A078463] N80-21038
LASER APPLICATIONS
Application of Raman diagnostics to combustion
[NASA-CR-162901] N80-20339
Development of combustion diagnostics and applications to turbulent combustion
[AD-A079523] N80-20348
Selection of a ruby laser for use as an illuminating laser for the BMK75 or as a reflecting laser for SRS N80-20683
Airborne laser fluorosensing of surface water chlorophyll a — Lake Mead, Nevada
[PB80-113400] N80-20797
Laser induced fluorescence of trapped molecular ions
[LBL-10021] N80-21114
LASER DOPPLER VELOCIMETERS
Velocity profiles in a long inlet duct employing a photon correlating laser velocimeter without seeding
[AD-A079878] N80-20278
Studies of the statistical bias and signal characteristics of laser velocimeters
[AD-A079634] N80-20579
LASER FUSION
Efficient high energy infrared third harmonic generation in gases and liquids for laser fusion applications — carbon dioxide lasers
[COO-4251-7] N80-20581
Conceptual design study of the hybrid lithium waterfall laser fusion chamber
[UCRL-13944] N80-20583
LASER OUTPUTS
Free electron laser: An introduction
[BNL-26501] N80-20580
Method and apparatus for Doppler frequency modulation of radiation
[NASA-CASE-NPO-14524-1] N80-21141
LASER PLASMA INTERACTIONS
Atomic and molecular processes
[AD-A079324] N80-21108
LASER PROPULSION
Beamed energy coupling studies
[AD-A080037] N80-20578
LASER RANGE FINDERS
Error analysis for a spaceborne laser ranging system
[NASA-CR-162887] N80-20575
The spaceborne laser ranging system N80-20785
LASER RANGER/TRACKER
SFB 78/IFAG projects for laser measurement of distances to satellites N80-20642
Study for a project for a European high precision laser network N80-20704
LASER SPECTROSCOPY
Laser-Raman measurements in a ducted, two-stream, subsonic, H2/air combustion flow
[AD-A078112] N80-20233
LASER TARGETS
Conceptual design study of the hybrid lithium waterfall laser fusion chamber
[UCRL-13944] N80-20583
LASER WELDING
Nickel contaminated titanium weld wire study
[LTR-141-83] N80-20391
LEAD (METAL)
Development of an example control strategy for lead
[PB80-123029] N80-20943
LEAD ACID BATTERIES
Test and evaluation report of the EROC Hybrid-Electric Van (HEVAN)
[DOE/TIC-10232] N80-21210
LEAST SQUARES METHOD
A method for examining relationships between multispectral data N80-20708
General least-squares fitting procedures to minimize the volume of a hyperellipsoid
[LA-8096-MS] N80-21081
LEAVES
Remote sensing of leaf water content in the near infrared N80-20788
Plant stress and relationships to spectral responses — cotton and tomato plants N80-20789
Assessing soybean leaf area and leaf biomass by spectral measurements — Beltsville, Maryland Agricultural Research Center N80-20775
LEGUMINOUS PLANTS
Monitoring drought in Colorado with LANDSAT MSS N80-20770
LIAPUNOV FUNCTIONS
On the existence of simple Liapunov functions for linear retarded difference differential equations
[AD-A075553] N80-21086
LIBYA
Application of LANDSAT imagery to monitor sand dunes movement in the Sahara Desert N80-20719
LIFE (DURABILITY)
TDRSS battery life cycle tests interim report N80-20845
Life test results of the NASA standard 20 ampere hour cells N80-20846
NWSC nickel cadmium spacecraft cell accelerated life test program data analysis N80-20852
Analytical modeling of battery cycle life N80-20856
Properties of isotonic estimators of mean lifetime in a simple prototype development model
[AD-A075578] N80-21091
LIFE CYCLE COSTS
A study of two avionics life cycle cost models and their applicability
[AD-A076981] N80-20268
An operating and support cost model for avionics automatic test equipment — f-16 aircraft
[AD-A075586] N80-20269
LIFT
An approximate analysis of wing unsteady aerodynamics
[AD-A079322] N80-20239
The effects of pitching rate on the hydrodynamic properties of hydrofoils
[AD-A079810] N80-20438
Lift analysis on the bow seal of the surface effect ship testcraft XR-3
[AD-A078507] N80-20439
LIFTING REENTRY VEHICLES
Investigation of numerical techniques for predicting aerodynamic heating to flight vehicles
[AD-A078121] N80-20234
LIGANDS
Time resolved analysis of fluorescent metal chelates N80-20336
LIGHT (VISIBLE RADIATION)
Interstellar matter and extragalactic light N80-21226
LIGHT AIRCRAFT
Exhaust emissions characteristics for a general aviation light-aircraft Teledyne Continental Motors (TCM) GTSIO-520-K piston engine
[AD-A080433] N80-20270
LIGHT MODULATION
Investigation of direct integrated optics modulators — applicable to data preprocessors
[NASA-CR-162894] N80-21143
LIGHT SCATTERING
Brillouin scattering in xenon near the critical point N80-21099
Optical detection of fiber particles in water — Lake Superior
[PB80-116896] N80-21148
LINE SHAPE
Line generalization and data reduction from a mathematical optimization point of view N80-20679
LINE SPECTRA
Study of Raman linewidths as a function of structure, bonding and temperature N80-21171
LINEAR ARRAYS
Multispectral linear array sensor development N80-20783
Linear array pushbroom radiometer data analysis N80-20784
LINEAR PROGRAMMING
Documentation of a computer program for Hillers heuristic procedure in integer linear programming
[AD-A075678] N80-21048
LINEAR SYSTEMS
Asymptotic eigenstructures
[NASA-CR-162900] N80-21050
LIQUID CHROMATOGRAPHY
Applications of liquid chromatography in the field of surface-active compounds
[BLL-RTS-11948] N80-20326
Performance of a gel permeation chromatograph and its usefulness in examining mixtures of organic materials — liquid chromatography analysis of epoxy resins
[AD-A079953] N80-20346
LIQUID CRYSTALS
Development of a color alphanumeric liquid crystal display — suitable for aircraft command and control
[AD-A079289] N80-20265
Hot wire anemometer investigation of turbulence levels and development of liquid crystal flow visualization techniques for the rectilinear cascade test facility
[AD-A078294] N80-20533
LIQUID FILLED SHELLS
Experimental study of cap and thickness influence on the vibration response and damping of flexible fluid-coupled coaxial cylinders
[CONF-790615-14] N80-20633
LIQUID FLOW
A calibration of the Preston tube in liquid flow systems
[AD-A079876] N80-20538
LIQUID HELIUM
Turbulence and statistical mechanics
[AD-A079757] N80-20536
LIQUID LITHIUM
Conceptual design study of the hybrid lithium waterfall laser fusion chamber
[UCRL-13944] N80-20583
LIQUID PHASES
Efficient high energy infrared third harmonic generation in gases and liquids for laser fusion applications — carbon dioxide lasers
[COO-4251-7] N80-20581
LIQUID-LIQUID INTERFACES
Development and applications of a lamellar model for analysis of liquid-liquid mixing N80-20521

LIQUID-VAPOR INTERFACES
Role of cluster size and surface on phase transitions N80-20331
LIQUIDS
Vapour pressures and critical points of liquids. 14: Aliphatic oxygen-nitrogen compounds
[ESDU-79030] N80-20329
LITHIUM
Lithium: Mineral commodity profiles
[PB80-123011] N80-20790
LITHIUM CHLORIDES
Electrical, thermal and abusive tests on lithium thionyl chloride cells N80-20829
Lithium thionyl chloride high rate discharge N80-20830
LITHIUM COMPOUNDS
Lithium battery discharge tests N80-20831
LITHIUM SULFUR BATTERIES
Lithium cell technology and safety report of the Tri-Service Lithium Safety Committee N80-20824
NASA/Marshall's lithium battery applications N80-20825
High energy density battery development status report N80-20826
Galileo lithium/SO2 N80-20827
Sulfur studies on lithium sulfur dioxide batteries N80-20828
Electrical, thermal and abusive tests on lithium thionyl chloride cells N80-20829
Lithium thionyl chloride high rate discharge N80-20830
Lithium battery discharge tests N80-20831
Characterization of prototype secondary lithium battery N80-20832
Rechargeable ambient temperature lithium cells N80-20833
The Exxon rechargeable cells — solar rechargeable clocks N80-20834
High temperature storage characteristics of lithium sulfur dioxide cells N80-20835
LITHOLOGY
Geological/geophysical resource assessment — Rio Grande rift N80-20725
Regional Modeling: The Kentucky anomaly N80-20730
Plate boundary deformation in California — Southern California: Elsinore, Earthquake Valley, and San Felipe Faults N80-20739
LITHOSPHERE
Interpretation of geoid anomalies in the vicinity of subduction zones — Tonga-Kermadec and the New Hebrides island arc, North Fiji, South Fiji and Lau-havre N80-20732
Global geology and geophysics using satellite-derived data N80-20733
Geophysical atlas N80-20734
Earthquake and crustal deformation studies — San Francisco and Fort Ross, California N80-20743
Global intra-plate volcanism N80-20744
LOAD TESTS
Structural tests on a tile/strain-isolation pad thermal protection system — space shuttles
[NASA-TM-80226] N80-20302
The practical limit of loading nickel hydroxide electrodes N80-20857
LOADS (FORCES)
Use of two-dimensional transmission photoelastic models to study stresses in double-lap bolted joints: Load transfer and stresses in the inner lap
[VPI-E-80-9] N80-20621
On the load displacement relation for a cracked rectangular specimen with constrained ends
[AD-A075527] N80-20624
Materials and mechanics of rate effects in brittle fracture — cantilever beams and steels
[COO-2422-22] N80-20835
LOGIC CIRCUITS
The Art of Communications Interfaces; technology insertion in the C3I arena: Proceedings of the 4th Annual Seminar
[AD-A078344] N80-20471
A 20 bit plus sign, relay switched D/A converter
[PB80-105331] N80-20509
LOGISTICS MANAGEMENT
Management information systems, volume 2: A bibliography with abstracts
[PB80-802739] N80-21193
LONG DURATION EXPOSURE FACILITY
The LDEF heat pipe experiment power systems N80-20843
LONGITUDE MEASUREMENT
Elaborating an astronomical longitude system N80-20647
LOOP ANTENNAS
On the physical realizability of broad-band equivalent circuits for wire loop and dipole antennas
[AD-A079961] N80-20498
LOW DENSITY MATERIALS
Perlite: Mineral commodity profiles
[PB80-111362] N80-20359
LOW GRAVITY MANUFACTURING
Ultrapure glass optical waveguide development in microgravity by the sol-gel process
[NASA-CR-162910] N80-21142
LOW SPEED
Optimum subsonic, high-angle-of-attack nacelles
[NASA-TM-81491] N80-20275
LOW SPEED WIND TUNNELS
Scale model studies for establishing the flow patterns of a low-speed tunnel
[NASA-CR-159234] N80-20285
LOW TEMPERATURE
Low temperature thermal conductivities of glassy carbons
[COO-1198-1280] N80-20323
LOW VISIBILITY
Inertially augmented approach couplers
[AD-A080488] N80-20248
LUBRICANTS
Surface temperatures and glassy state investigations in tribology, part 3 — limiting shear stress rheological model
[NASA-CR-3272] N80-20588
LUBRICATION
Lubrication of rolling-element bearings
[NASA-TM-81449] N80-20591
LUMPING
Lump partitioning of integrated-circuit bipolar transistor models for high-frequency applications N80-20482
LUNAR EFFECTS
Earth tides N80-20652
LUNAR EXPLORATION
The Apollo spacecraft: A chronology volume 4, 21 January 1966 - 13 July 1974
[NASA-SP-4009] N80-20437

M

MACHINE TOOLS
Pulse-width-modulated amplifier drives for machine tools
[Y/DX-02] N80-20598
MACHINING
The Science of Ceramic Machining and Surface Finishing 2 — conferences
[PB80-110133] N80-20441
Grinding and polishing articles in bulk: Burnishing
[NASA-TM-75774] N80-20590
MAGMA
Global intra-plate volcanism N80-20744
MAGNESIUM
Effect of space flight on sodium, copper, manganese and magnesium content in the skeletal bones
[NASA-TM-75506] N80-21025
MAGNETIC ANOMALIES
Spherical harmonic models of the core field N80-20727
Crustal anomaly representation N80-20728
Anomaly verification: Comparison of Pogo magnetic data with aeromagnetic measurements N80-20729
Regional Modeling: The Kentucky anomaly N80-20730
Interpretation of geoid anomalies in the vicinity of subduction zones — Tonga-Kermadec and the New Hebrides island arc, North Fiji, South Fiji and Lau-havre N80-20732
Global geology and geophysics using satellite-derived data N80-20733
Geophysical atlas N80-20734
MAGNETIC CIRCUITS
A normal yoke for the determination of the magnetic characteristics of electrical sheets
[BLL-RTS-11946] N80-20481
MAGNETIC DISPERSION
Dispersion and attenuation characteristics of modes in a TEM-Cell with a lossy dielectric slab
[PB80-105141] N80-20571
MAGNETIC DOMAINS
Magnetic bubble research
[AD-A078702] N80-21040
MAGNETIC EQUATOR
Crustal anomaly representation N80-20728
MAGNETIC FIELDS
Atomic hydrogen storage — cryotrapping and magnetic field strength
[NASA-CASE-LEW-12081-2] N80-20402
Induced electromagnetic fields in conducting bodies irradiated by magnetic fields and microwaves N80-20452
Magnetic field modeling and crustal studies N80-20726
Spherical harmonic models of the core field N80-20727
Divertor experiments in a toroidal plasma, with ExB drift due to an applied radial electric field N80-21151
Numerical study of current-driven collisional drift and alfven instabilities in a sheared magnetic field
[IPPJ-436] N80-21157
MAGNETIC FLUX
Nonideal compensation in MHD generators — models of the distortion of the total magnetic flux density by the induced magnetic flux density N80-21149
MAGNETIC MEASUREMENT
Anomaly verification: Comparison of Pogo magnetic data with aeromagnetic measurements N80-20729
MAGNETIC PERMEABILITY
Ground states and magnetic responses of model valence-fluctuation systems
[LA-UR-79-3144] N80-21176
MAGNETIC PROPERTIES
A normal yoke for the determination of the magnetic characteristics of electrical sheets
[BLL-RTS-11946] N80-20481
Influence of magnetic ordering on the superconducting properties of amorphous (Zr/sub 1-x/Er/sub x/)3Rh alloys
[CALT-822-110] N80-20502
MAGNETIC SIGNATURES
The rotation of the Sun: Observations at Stanford — using the Doppler effect
[NASA-CR-162914] N80-21240
MAGNETIC STORMS
Substorm-related VLF chorus events: Local-time dependence and relationship to newly-injected clouds of drifting energetic electrons N80-20450
MAGNETIC SUSPENSION
Sensitivity adaptive control of a magnetic suspension system
[AD-A077148] N80-21052
MAGNETOHYDRODYNAMIC GENERATORS
Nonideal compensation in MHD generators — models of the distortion of the total magnetic flux density by the induced magnetic flux density N80-21149
Development, testing and evaluation of MHD materials and components designs
[FE-2248-22] N80-21160
Advances in MHD technology
[CONF-790598-5] N80-21166
MAGNETOHYDRODYNAMIC STABILITY
Stability analysis of cylindrical Vlasov equilibria N80-21152
Numerical study of current-driven collisional drift and alfven instabilities in a sheared magnetic field
[IPPJ-436] N80-21157
Strongly turbulent stabilization of electron beam-plasma interactions
[NASA-CR-162843] N80-21159
MAGNETOHYDRODYNAMICS
Evaluation of some cryogenic sensors and instrumentations for a large superconducting MHD magnet
[CONF-790815-30] N80-20568
Development, testing and evaluation of MHD materials and components designs
[FE-2248-22] N80-21160
Advances in MHD technology
[CONF-790598-5] N80-21166
MAGNETOSPHERE
Magnetic field modeling and crustal studies N80-20726
Outer satellite atmospheres: Their extended nature and planetary interactions — sodium cloud of Io, hydrogen torus of Titan, and comet atmospheres
[NASA-CR-162902] N80-21235

MAINTENANCE
Computer circuit card puller
[NASA-CASE-FRC-11042-1] N80-20589
MAN MACHINE SYSTEMS
Research on new electronic display technologies
[AD-A079323] N80-21035
Improvement of a process to identify the parameters for the optimal control model (BBN)
[ILR-40] N80-21055
MANAGEMENT INFORMATION SYSTEMS
Functional analysis of the Water Resources Scientific Information Center (WRSIC)
[PB80-111842] N80-20804
Study and implementation of an ESA computerized planning system, phase 1. Volume 2: Data files and updating
[GTS-760972-VOL-2] N80-21186
Study and implementation of an ESA computerized planning system, phase 2. Volume 4: Updating of Subprograms ESA 1-5
[GTS-760972-VOL-4] N80-21187
Study and implementation of an ESA computerized planning system, phase 2. Volume 5: Project returns and benefits
[GTS-760972-VOL-5] N80-21188
Study and implementation of an ESA computerized planning system. Executive summary
[GTS-760972-VOL-6] N80-21189
Management information systems, volume 2. A bibliography with abstracts
[PB80-802739] N80-21193
MANAGEMENT METHODS
Planning and control of research and development projects with contributions from space technology N80-21185
MANAGEMENT PLANNING
Mechanization architecture for enhancement of avionics planning data base
[AD-A075572] N80-20267
Guidelines to the air quality management systems, revised
[PB80-109978] N80-20953
Study and implementation of an ESA computerized planning system, phase 1. Volume 2: Data files and updating
[GTS-760972-VOL-2] N80-21186
Urbanization and water quality planning: The 208 experience in Massachusetts
[PB80-106743] N80-21214
Challenges in urban runoff control (planning, implementation and simulation)
[PB80-107873] N80-21221
MANGANESE
Reliability of energy dispersive X-ray fluorescence analysis of low-alloy steels
[AD-A077154] N80-20371
Effect of space flight on sodium, copper, manganese and magnesium content in the skeletal bones
[NASA-TM-75506] N80-21025
MANIPULATORS
Compliance and force control for computer controlled manipulators
[AD-A077708] N80-21054
A recursive Lagrangian formulation of manipulator dynamics and a comparative study of dynamics formulation complexity
[AD-A078067] N80-21062
MANNED SPACE FLIGHT
The Apollo spacecraft: A chronology volume 4, 21 January 1966 - 13 July 1974
[NASA-SP-4009] N80-20437
MANUFACTURING
Production of thin film networks which utilize chrome-gold conductors
[BDX-613-2257] N80-20503
Inorganic spark chamber frame and method of making the same
[NASA-CASE-GSC-12354-1] N80-20565
MAPPING
Airborne electronic terrain map system: A literature review
[AD-A079402] N80-20255
Reports on cartography and geodesy. Series 1: Original report no. 73
[REPT-73] N80-20638
Cartography applications and research N80-20654
Development, status, and goals of cartographic automation N80-20655
Automatic acquisition and processing of cartographic data N80-20656
On precision in the gathering and production of cartographic data N80-20657
Computer based generalization for the elaboration and extension of topographic maps N80-20658
Graphic production of maps on screens or photocomposition devices N80-20659
The data bank in the cartographic automation system N80-20660
The topographic synoptic map 1:200,000 N80-20661
The synoptic map 1:500,000 (World, Series 1404) N80-20662
The international world map 1:1,000,000 (IWK) N80-20663
Photogrammetry in IFAG from 1952 to 1977 N80-20664
Orthophoto techniques and photomaps N80-20666
Aerial and space-borne photographic maps N80-20667
Reports on cartography and topographical measurements. Series 1: Original report no. 74
[REPT-74] N80-20674
On the displacement problem as part of a process in generalizing topograhical maps. Proposition for heirarchial order and the search for EDP assisted solutions N80-20675
A symbol disk with interchangeable symbols and its applications to cartography N80-20677
Line generalization and data reduction from a mathematical optimization point of view N80-20678
Reports on cartography and topographical measurements. Series 2: Translations --- computer assisted data correlation
[REPT-35] N80-20679
Testing the accuracy of cartographic equipment: First results N80-20683
Locational characteristics and the sequence of computer assisted processes of cartographic generalization N80-20685
Experiences gathered with a symbol disk with interchangeable symbols N80-20688
Data capture for cartographic data bases N80-20689
Reports on cartography and topographical measurements. Series 1: Original reports
[REPT-77] N80-20705
The problem of obtaining data for the Digital Height Model N80-20707
The gravity field in the central pacific from satellite-to-satellite tracking and implications for mantle convection N80-20750
Interactive aids for cartography and photo interpretation
[AD-A079553] N80-20789
Experiments in digitizing line structures by a raster scan process
[GMD-MITT-37] N80-20793
Determination of lines and nodes from images
[GMD-MITT-44] N80-20794
MAPS
A program for the fully automated displacement of point and line features in cartographic generalization N80-20680
Map projection change: Some programs for the transformation of the contents of available maps according to different map projections N80-20690
Geophisical atlas N80-20734
Distance estimation from cognitive maps
[AD-A080098] N80-20788
MARINE BIOLOGY
Decline of submerged aquatic plants in Chesapeake Bay
[PB80-114747] N80-21009
MARINE METEOROLOGY
Monthly climatology for evaporation duct occurrence in the North Atlantic Ocean
[AD-A075524] N80-20992
MARINE PROPULSION
Feasibility study of an isolated reverse-turbine system for gas turbine engines --- marine propulsion
[AD-A077898] N80-20276
MARINE RESOURCES
Microwave remote sensing technology for the marine oil pollution surveillance
[REPT-202] N80-20786
MARINE TECHNOLOGY
Observations of position, ocean depth, ice rotation, magnetic declination and gravity taken at the FRAM 1 drifting ice station
[AD-A077063] N80-20966
MARKET RESEARCH
Market definition study of photovoltaic power for remote villages in the United States
[NASA-CR-159800] N80-20612
MARKETING
Marketing and market acceptance data from the Residential Solar Demonstration Program. Volume 1: Detailed analysis, autumn 1979
[PB80-115296] N80-21197
Geothermal energy market penetration: Development of a model for the residential section
[PB80-118359] N80-21198
MARKOV CHAINS
A non-Gaussian stochastic model applied to deconvolution and seismogram inversion N80-20961
MARKOV PROCESSES
Simulating generalized semi-Markov processes
[AD-A075549] N80-21089
MARS ATMOSPHERE
An investigation and analysis of the density and thermal balance of the Martian ionosphere N80-21230
MARS CRATERS
Comparative planetology/crustal evolution N80-20735
MARS SURFACE
Geomorphology of Martian valleys N80-21232
MARTENSITE
Computer simulation of the martensite transformation in a model two-dimensional body
[LBL-9346] N80-20383
MARTENSITIC TRANSFORMATION
Computer simulation of the martensite transformation in a model two-dimensional body
[LBL-9346] N80-20383
MARYLAND
Crustal structure and dynamics of southeastern US --- Maryland, Virginia, North Carolina, South Carolina, West Virginia, Georgia, Tennessee, and Kentucky N80-20738
GSFC site stability N80-20741
Assessing soybean leaf area and leaf biomass by spectral measurements --- Beltsville, Maryland Agricultural Research Center N80-20775
MASS DISTRIBUTION
Information theory density distribution --- Earth Mantle N80-20753
MASS SPECTRA
A Differential population synthesis approach to mass segregation in M92 N80-20614
MASS SPECTROMETERS
Selected ion fragmentation with a triple quadrupole mass spectrometer N80-20337
MASS SPECTROSCOPY
ISS/SIMS characterization of UV/O sub 3 cleaned surfaces
[AD-A078425] N80-20375
Photoionization studies of molecular dynamics and energetics
[AD-A079814] N80-21110
MASS TRANSFER
Solution of the equations of convective heat, mass, and momentum transfer by the finite-element method using quadrilateral elements N80-20515
MASSACHUSETTS
NASA-census Application Pilot Test (APT) and urban area delineation studies --- Seattle, Washington; Austin, Texas; Orlando, Florida; Boston, Massachusetts, and Richmond, Virginia N80-20765
MATERIALS RECOVERY
Chemistry research and development --- americium and plutonium recovery and purification
[RFP-2952] N80-20309
Assessment of the impact of resource recovery on the environment
[PB80-102874] N80-20948
MATHEMATICAL MODELS
Airborne aids for coping with low-level wind shear. All-weather landing systems, engineering services support project, task 2 --- the use of aircraft instruments, flight simulation techniques, and mathematical models to understand wind shear effects during aircraft approach and takeoff
[AD-A080589] N80-20242

Development of wind shear models and determination of wind shear hazards
[AD-A080588] N80-20243
A study of two avionics life cycle cost models and their applicability in the communications-electronics-meteorological joint
[AD-A076981] N80-20268
An operating and support cost model for avionics automatic test equipment --- f-16 aircraft
[AD-A075586] N80-20269
Alternatives for jet engine control
[NASA-CR-162911] N80-20273
Theoretical and computational approach to modeling flame ignition
[AD-A079306] N80-20347
Detailed modeling of diesel combustion
[CONF-7709196-1] N80-20352
Chemical kinetic modeling for combustion applications
[UCRL-81777] N80-20353
A model of natural HF radio noise in severely disturbed propagation environments
[AD-A077619] N80-20474
Development of numerical techniques and computer systems for design, analysis and fabrication of interdigital transducers as surface acoustic wave devices
[AD-A079623] N80-20493
The dynamics of an ultrasonic cavitation bubble N80-20520
Development and applications of a lamellar model for analysis of liquid-liquid mixing N80-20521
Evolution of turbulence by three-dimensional numerical particle-vortex tracing N80-20523
Progress in turbulence modeling for complex flow fields including effects of compressibility
[NASA-TP-1517] N80-20527
Nonlinear wave process hierarchies and the cyclic development of quasi-ordered structures in turbulent shear flows
[AD-A079619] N80-20545
Modeling and error analysis of a superconducting gravity gradiometer N80-20557
Downstream mixing gasdynamic lasers: A numerical solution --- of supersonic mixing flows below the nozzle exit N80-20572
On a mathematical model for remote sensing altimetry N80-20716
Magnetic field modeling and crustal studies N80-20726
Spherical harmonic models of the core field N80-20727
Gravity model improvement for SEASAT N80-20749
Development of failure model for nickel cadmium cells N80-20854
Analytical modeling of battery cycle life N80-20856
Numerical simulation of dual-media thermal energy storage systems
[SAND-78-2282] N80-20875
Performance model for molten carbonate fuel cells
[TR-190] N80-20884
Industrial Sector Technology Use Model (ISTUM): Industrial energy use in the United States, 1974 - 2000. Volume 2: Results
[DOE/FE-2344/2] N80-20885
Limits to energy modeling
[ORAU-IEA-79-16(0)] N80-20907
Wind Energy System Time-domain (WEST) analyzers using hybrid simulation techniques
[NASA-CR-159737] N80-20909
A global biogeocenotical biosphere simulation
[NASA-TM-76042] N80-20920
A non-Gaussian stochastic model applied to deconvolution and seismogram inversion N80-20951
The generation of synthetic seismograms for laterally heterogeneous models using the finite difference technique N80-20962
Preliminary report of numerical simulations of intermediate wavelength ExB gradient drift instability in ionospheric plasma clouds
[AD-A079313] N80-20968
Resonance zones on the surface of a dipping layer due to plane SH seismic input
[PB80-107907] N80-20980
An improved model for the calculation of longwave flux at 11 micrometers --- satellite radiance measurements
[PB80-119431] N80-20981
Equatorial Pacific Ocean variability-seasonal and El Nino time scales N80-21007
Improvement of a process to identify the parameters for the optimal control model (BBN)
[ILR-40] N80-21055
Bifurcations of a model diffusion-reaction
[AD-A079725] N80-21071
Properties of isotonic estimators of mean lifetime in a simple prototype development model
[AD-A075578] N80-21091
Passive infrared surveillance. Part 1: Model formulation
[AD-A075603] N80-21145
Nonideal compensation in MHD generators --- models of the distortion of the total magnetic flux density by the induced magnetic flux density N80-21149
Stability analysis of cylindrical Vlasov equilibria N80-21152
Mathematical models of some controlled crystallization process
[BLL-RTS-12032] N80-21168
Ground states and magnetic responses of model valence-fluctuation systems
[LA-UR-79-3144] N80-21176
Geothermal energy market penetration: Development of a model for the residential section
[PB80-118359] N80-21198
On the production of long-period comets by stellar perturbations of the Oort comet clouds --- calculation of orbital perturbation of comets around the Sun due to passing stars N80-21231

MATRICES (MATHEMATICS)
Fast parallel realization of matrix multiplication
[AD-A060074] N80-21063

MATTER (PHYSICS)
Studies in the electronic structure of matter
[COO-1198-1268] N80-21174

MAXIMUM PRINCIPLE
An estimate related to the strong maximum principle
[AD-A079705] N80-21065

MEAN
Consistent estimation of variance parameters from many small samples with different means
[AD-A078227] N80-21087

MEASURING INSTRUMENTS
The hailpad: Construction and materials data reduction, and calibration
[PB80-103989] N80-21001

MECHANICAL DEVICES
Instantaneous kinematics of multiple degree-of-freedom motions N80-21098

MECHANICAL DRIVES
Pulse-width-modulated amplifier drives for machine tools
[Y/DX-02] N80-20598

MECHANICAL ENGINEERING
Mechnical energy storage technology development
[SAND-79-1151] N80-20874

MECHANICAL PROPERTIES
Effect of heat treatment on fracture of type 304L stainless steel in a hydrogen environment
[DP-MS-79-18] N80-20384
Determination of basalt physical and thermal properties at varying temperatures, pressures, and moisture contents
[RHO-BWI-C-55] N80-20971
Determination of basalt physical and thermal properties at varying temperatures, pressures, and moisture contents
[RHO-BWI-C-54] N80-20972

MECHANIZATION
Mechanization architecture for enhancement of avionics planning data base
[AD-A075572] N80-20267

MEDICAL SCIENCE
European scientific notes, volume 33, number 11
[AD-A079711] N80-21241

MEDICAL SERVICES
Biomedical communications experiments. Using the communications technology satellite: Technical evaluation
[PB80-111016] N80-20476

MELTING POINTS
Structural assessment of involutes
[AD-A077875] N80-20318
Vapor pressure and melting behavior of sulfuric acid-water systems
[PB80-116007] N80-20363

MELTS (CRYSTAL GROWTH)
Mathematical models of some controlled crystallization process
[BLL-RTS-12032] N80-21168

MEMBRANE STRUCTURES
Extension of the Vaughan-Florence analysis of dynamic buckling of a rigid-plastic cylindrical shell
[COO-4122-28] N80-20637

MEMBRANES
Research and development on a spiral-wound membrane system for single-stage seawater desalination
[PB80-114705] N80-20357

MEMORY
K-lines: A theory of memory
[AD-A078116] N80-21030

MENTAL PERFORMANCE
K-lines: A theory of memory
[AD-A078116] N80-21030

MERCURY (METAL)
Measurements and calculations of electronic excitation from collisions between atoms of alkalis and mercury in the energy range 10 eV to 1400 eV
[MPIS-24/1978] N80-21181

MERCURY VAPOR
Investigation of Hg2 as a discharge pumped optical storage medium
[COO-4630.A000-1] N80-20582

MESOSCALE PHENOMENA
Ocean circulation N80-20761

METAL BONDING
Fracture mechanics of bi-material interface cracks --- the behavior of a metallic interface cracks N80-20611

METAL FATIGUE
X-ray analysis of accrued damage in stress corrosion and corrosion fatigue --- 304 austenitic stainless steel and al 2024
[AD-A078511] N80-20372
Stress corrosion of steel. A bibliography with abstracts
[PB80-803729] N80-20394

METAL FILMS
Production of thin film networks which utilize chrome-gold conductors
[BDX-613-2257] N80-20503

METAL IONS
Time resolved analysis of fluorescent metal chelates N80-20336

METAL OXIDES
Energy of 100 coincidence twist boundaries in transition metal oxides
[CONF-7907101-2] N80-21179

METAL PLATES
Nickel electrode plate thickening study N80-20858
Update, comparing different plate treatments and des N80-20860

METAL POWDER
Influence of purity level on the mechanical properties of hot isostatically pressed beryllium
[SAND-79-8232] N80-20377

METAL SHEETS
A normal yoke for the determination of the magnetic characteristics of electrical sheets
[BLL-RTS-11946] N80-20481

METAL SURFACES
A fundamental approach to adhesion: Synthesis, surface analysis, thermodynamics and mechanics --- acid-base properties of titanium 6-4 surfaces
[NASA-CR-162903] N80-20397
High power ion-irradiation test for CTR first wall --- using a plasma anode
[IPPJ-437] N80-21158

METAL VAPOR LASERS
Method and apparatus for convection control of metallic halide vapor density in a metallic halide laser
[NASA-CASE-NPO-15021-1] N80-20574

METAL VAPORS
Method and apparatus for convection control of metallic halide vapor density in a metallic halide laser
[NASA-CASE-NPO-15021-1] N80-20574

METAL WORKING
Large-strain deformation of a mild steel at intermediate temperatures N80-20369
Rigid-plastic finite-element analysis of plastic deformation in metal-forming processes
[AD-A079987] N80-20630
METALLIC STARS
A Differential population synthesis approach to mass segregation in M92 N80-20614
METALLIZING
Development of low cost contacts to silicon solar cells
[NASA-CR-162905] N80-20815
METALS
Technical options for conservation of metals: Case studies of selected metals and products
[PB80-102619] N80-20393
METASTABLE STATE
Analytical electron microscope study of the omega phase transformation in a zirconium-niobium alloy
[COO-1198-1279] N80-20385
METEOROLOGICAL INSTRUMENTS
The hailpad: Construction and materials data reduction, and calibration
[PB80-103989] N80-21001
METEOROLOGICAL PARAMETERS
The 19304D GSRS, missile number 1046, round number V-66, 23 August 1979
[AD-A079989] N80-20988
The 19304B GSRS, missile numbers 1139, 1051 and 1037, round numbers V-61, V-62 and V-63, 9 August 1979
[AD-A079994] N80-20989
A test of the climatic normality of synthetic profiles of atmospheric liquid water content over the USSR in 1973
[AD-A077021] N80-20990
US Navy and Marine Corps Meteorological station climatic summaries
[AD-A076976] N80-20991
Mariners weather log
[PB80-113277] N80-20994
Meteorological criteria for standard project hurricane and probable maximum hurricane windfields, gulf and east coasts of the United States
[PB80-117997] N80-20999
METEOROLOGICAL RADAR
Nowcast and short-range (0-2 hour) forecasts of thunderstorms and severe convective weather for use in air traffic control
[AD-A080426] N80-20247
GATE radar rainfall atlas
[PB80-121130] N80-21003
METEOROLOGICAL SATELLITES
Satellite calibration data, annual data report
[AD-A075602] N80-20301
Interactive digital satellite image processing system for oceanographic applications
[AD-A079697] N80-20790
METEOROLOGY
Some new mathematical methods for variational objective analysis using splines and cross validation
[AD-A079302] N80-21067
METHANE
Production of methane using an anaerobic filter
[ANL-TRANS-1164] N80-20428
Direct observation of the reactions of the atom O(1D) with halogen compounds of methane and with methane and water
[MPIS-25/1978] N80-21125
METHYL ALCOHOLS
Combustion of methanol coal slurries in Hartmann resonator
[FE-2744-T2] N80-20351
METRIC SPACE
Accelerating particles in general relativity (stationary C-metric) N80-21184
MEXICO
Geological/geophysical resource assessment --- Rio Grande rift N80-20725
MICROCLIMATOLOGY
Design of data acquisition and control systems for environmental monitoring and microclimate control
[COO-4397-T3] N80-20924
MICROCOMPUTERS
Microcomputers: General applications, part 1, volume 4. Citations from the Engineering Index data base
[NTIS/PS-79/0726/4] N80-21041
MICROELECTRONICS
Production of thin film networks which utilize chrome-gold conductors
[BOX-613-2257] N80-20503
MICROORGANISMS
Development of a biological simulation monitor for joint municipal/industrial treatment systems
[PB80-111032] N80-20951
MICROPROCESSORS
MIL-M-38510/470 test vectors: Fault detection efficiency measurement via hardware fault simulation --- rca 1802 microprocessor
[NASA-CR-162916] N80-21037
MICROSTRUCTURE
Subgrain refinement strengthening in stainless steel alloys N80-20368
Stress corrosion environmental effects on AF 1410 --- aircraft construction materials
[AD-A078598] N80-20374
Correlations between fracture toughness and microstructure in 4140 steel, MRL E-113
[COO-3064-67] N80-20379
Analytical electron microscope study of the omega phase transformation in a zirconium-niobium alloy
[COO-1198-1279] N80-20385
Microstructural studies of thick film resistors using transmission electron microscopy
[SAND-79-0387C] N80-20508
MICROWAVE AMPLIFIERS
High power millimeter wave amplifier --- results of tests on traveling wave tubes
[AD-A078007] N80-20491
GaAs analog integrated circuits (GaAs RF-LSI), phase 1. Volume 2: Appendices
[AD-A079589] N80-20496
MICROWAVE COUPLING
Phase 2: Array automated assembly task low cost silicon solar array project
[NASA-CR-162912] N80-20817
MICROWAVE EQUIPMENT
Evaluation of gallium nitride for active microwave devices
[AD-A079319] N80-20494
GaAs analog integrated circuits (GaAs RF-LSI), volume 1 --- microwave receivers
[AD-A079588] N80-20497
MICROWAVE SENSORS
Microwave remote sensing technology for the marine oil pollution surveillance
[REPT-202] N80-20796
MICROWAVE TUBES
Investigation of in situ composites for electromagnetic device applications with emphasis on development of microwave tube cathodes and high resolution displays
[AD-A079698] N80-20021
MICROWAVES
Induced electromagnetic fields in conducting bodies irradiated by magnetic fields and microwaves N80-20452
MIE SCATTERING
Particle diagnostics using Mie scattering and image intensification techniques --- to analyze particles in exhaust emission
[AD-A079888] N80-20541
MILITARY OPERATIONS
Miniaturized thermoelectric power sources
[AD-A075609] N80-20869
MILITARY TECHNOLOGY
NAVSTAR GPS civil applications study
[AD-A078277] N80-20257
Lithium cell technology and safety report of the Tri-Service Lithium Safety Committee N80-20824
High energy density battery development status report N80-20826
MILKY WAY GALAXY
The high latitude extensions of galactic spiral arms --- of interstellar gas N80-21228
MILLIMETER WAVES
Sources of tracking error in millimeter wavelength missile guidance systems
[AD-A078226] N80-20298
Near-millimeter wave technology base study. Volume 1: Propagation and target/background characteristics
[AD-A079620] N80-20481
High power millimeter wave amplifier --- results of tests on traveling wave tubes
[AD-A078007] N80-20491
MIM (SEMICONDUCTORS)
Theory and applications of negative differential resistance in the current-voltage characteristics of metal-insulator-metal diodes N80-20484
MINERAL DEPOSITS
Perlite: Mineral commodity profiles
[PB80-111362] N80-20359
Molybdenum: Mineral commodity profiles
[PB80-110865] N80-20392
Geological/geophysical resource assessment --- Rio Grande rift N80-20725
Lithium: Mineral commodity profiles
[PB80-123011] N80-20799
Development document for effluent limitations guidelines and new source performance standards for the mineral mining and processing point source category
[PB80-110299] N80-20940
MINERAL EXPLORATION
Geobotanical exploration --- Mineral, Virginia N80-20724
MINERALOGY
Bismuth: Mineral commodity profiles, August 1979
[PB80-111438] N80-20361
Cadmium
[PB80-111420] N80-20362
MINERALS
A global biogeocenotical biosphere simulation
[NASA-TM-76042] N80-20920
MINES (EXCAVATIONS)
Surface mine monitoring --- Pennsylvania N80-20764
PLASTIC CANOPY: A computer program for the structural analysis of protective canopies
[PB80-122724] N80-20798
MINICOMPUTERS
Minicomputer controlled system for testing telemetry receiving and recording systems
[AD-A078603] N80-20305
Guidelines for evaluation of minicomputer hardware and software: A users perspective
[AD-A078480] N80-21039
MINIMAX TECHNIQUE
Some contributions to gamma-minimax and empirical Bayes selection procedures N80-21085
MINING
Earth Survey Applications Division: Research leading to the effective use of space technology in applications relating to the Earth's surface and interior
[E80-10094] N80-20722
Earth survey applications division: Research leading to the effective use of space technology in applications relating to the Earth's surface and interior
[E80-10087] N80-20723
Environmental development plan: Coal extraction and preparation
[DOE/EDP-0060] N80-20921
Development document for effluent limitations guidelines and new source performance standards for the mineral mining and processing point source category
[PB80-110299] N80-20940
MINNESOTA
Solar heating system design package for a single-family residence at William O'Brien State Park, Minnesota
[NASA-CR-161357] N80-20866
MIRRORS
Installation and startup of the fixed mirror solar concentrator collector field subsystem
[GA-A-15344] N80-20888
MIS (SEMICONDUCTORS)
Metal-insulator-semiconductor aspects of monolithic zinc oxide surface acoustic wave structures N80-20483
MISSILE CONTROL
Sampled-data analysis in parameter space
[AD-A077879] N80-20297
Sources of tracking error in millimeter wavelength missile guidance systems
[AD-A078226] N80-20298
MISSILE RANGES
The 19304B GSRS, missile numbers 1139, 1051 and 1037, round numbers V-61, V-62 and V-63, 9 August 1979
[AD-A079994] N80-20989

MISSILE STRUCTURES
Aerothermal evaluation of high-temperature structural materials for use in high-performance missile design
[AD-A080023] N80-20319
MIXING
Development and applications of a lamellar model for analysis of liquid-liquid mixing N80-20521
Downstream mixing gasdynamic lasers: A numerical solution --- of supersonic mixing flows below the nozzle exit N80-20572
MIXTURES
Pavement recycling-bituminous concrete and concrete mix designs
[PB80-106263] N80-20443
MODULATION TRANSFER FUNCTION
A direct measure of CRT image quality
[AD-A075610] N80-21146
MODULUS OF ELASTICITY
Composite wall concept for high temperature turbine shrouds: Survey of low modulus strain isolator materials
[NASA-TM-81443] N80-20398
Structure and properties of glasses --- beryllium fluoride glass
[AD-A080071] N80-20400
MOISTURE
Prediction and verification of moisture effects on carbon fiber-epoxy composites
[AD-A079557] N80-20320
MOISTURE CONTENT
Remote sensing of leaf water content in the near infrared N80-20768
Plant stress and relationships to spectral responses --- cotton and tomato plants N80-20769
Spectra of isolated vegetational constituents N80-20779
A spectral method for determining the percentage of green herbage material in clipped samples N80-20780
Evaluation of a spectral method for percentage green determination using clipped rangeland forage samples --- Texas N80-20781
MOLECULAR BEAMS
A study of the collision processes in the thermic energy region by using atoms excited by laser light
[MPIS-2/1978] N80-20584
Physics with fast molecular-ion beams
[ANL/PHY-79-3] N80-21115
Molecular beam photoionization and gas-surface scattering
[LBL-9838] N80-21177
MOLECULAR COLLISIONS
Extremal effects in rotationally inelastic diffraction
[AD-A077151] N80-20342
Determination of forces on arbitrary concave bodies in high speed rarefied gases
[LOG-J11513] N80-20530
A study of the collision processes in the thermic energy region by using atoms excited by laser light
[MPIS-2/1978] N80-20584
Study of the interactions of rare gas molecules by measuring total and differential transverse scattering
[MPIS-15/1978] N80-21123
MOLECULAR EXCITATION
Measures of the transverse differential effect for the rotary excitation of the molecule HD colliding with Ne and D2
[MPIS-16/1978] N80-21124
MOLECULAR INTERACTIONS
Atomic and molecular processes
[AD-A079324] N80-21108
MOLECULAR IONS
Laser induced fluorescence of trapped molecular ions
[LBL-10021] N80-21114
Physics with fast molecular-ion beams
[ANL/PHY-79-3] N80-21115
Determination of molecular-ion structures through studies of the collisionally-induced dissociation of fast (MeV) molecular ions
[CONF-790843-10] N80-21116
MOLECULAR ORBITALS
Molecular orbital criteria for reductive elimination from organotransition-metal complexes
[AD-A079447] N80-20344
MOLECULAR ROTATION
Extremal effects in rotationally inelastic diffraction
[AD-A077151] N80-20342
MOLECULAR SPECTROSCOPY
Atomic and molecular gas phase spectrometry
[AD-A079657] N80-20350
Effects of high pressure on molecular electronic spectra. 2: Morse-potential formulation
[AD-A079898] N80-21109
MOLECULAR STRUCTURE
Photoionization studies of molecular dynamics and energetics
[AD-A079814] N80-21110
MOLYBDENUM
Reliability of energy dispersive X-ray fluorescence analysis of low-alloy steels
[AD-A077154] N80-20371
Molybdenum: Mineral commodity profiles
[PB80-110885] N80-20392
Exploratory studies in catalytic coal liquefaction
[EPRI-AF-1184] N80-20422
Catalyst characterization in coal liquefaction
[SAND-79-1969] N80-20423
MOLYBDENUM COMPOUNDS
N-type molybdenum diselenide-based liquid junction solar cells: A non-aqueous electrolyte system employing the chlorine/chloride couple
[AD-A079712] N80-20871
MOMENTUM TRANSFER
Solution of the equations of convective heat, mass, and momentum transfer by the finite-element method using quadrilateral elements N80-20515
Angular momentum transfer in deeply inelastic collisions
[RLO-1388-395] N80-21111
MONATOMIC GASES
Atomic hydrogen storage --- cryotrapping and magnetic field strength
[NASA-CASE-LEW-12081-2] N80-20402
MONITORS
Hydraulic diagnostic monitoring system
[AD-A077552] N80-20594
MONOPOLE ANTENNAS
Standard engineering installation package, nondirectional beacon
[AD-A078204] N80-20253
MONOTONE FUNCTIONS
On the maximality of the sum of two maximal monotone operators
[AD-A079724] N80-21070
MONTANA
Energy source book --- Colorado, Montana, North Dakota, South Dakota, Utah, and Wyoming
[DOE/TIC-10190] N80-20895
MOON
Extending the Neodymium-YAG laser reflectance measuring system to lunar measurements at the Wetzell station N80-20695
MORSE POTENTIAL
Effects of high pressure on molecular electronic spectra. 2: Morse-potential formulation
[AD-A079898] N80-21109
MORTALITY
Model for measuring the health impact from changing levels of ambient air pollution: Morbidity study
[PB80-107030] N80-21027
MOTHS
Remote monitoring of forest cover conditions --- deciduous tree defoliation in Pennsylvania N80-20763
MOTION PERCEPTION
Directional selectivity and its use in early visual processing --- construction of directionally selective units and their use in processing visual motion
[AD-A078054] N80-21144
MOTION SICKNESS DRUGS
Prophylaxis and treatment of seasickness
[NASA-TM-76108] N80-21024
MOTION SIMULATORS
Aircraft motion sensitivity to dynamic stability derivatives --- motion simulation studies using cross coupling derivatives on fighter/ bomber aircraft
[AD-A079421] N80-20283
MOUNTAINS
Improvement in classification accuracy of LANDSAT MSS data in areas of mountainous terrain N80-20766
Crystallization and metasomatism of the Cuchillo Mountain laccolith, Sierra County, New Mexico N80-20957
MOUNTING
Attaching of strain gages to substrates
[NASA-CASE-FRC-10093-1] N80-20560
MULTIPHASE FLOW
Fluid mechanics, internal flow sub-series. Volume 7: A guide to fan selection and performance
[ESDU-79037] N80-20511
MULTIPLE ACCESS
On correlation parameters for some binary sequences of lengths 31 and 63 for spread-spectrum multiple-access communications
[AD-A077152] N80-20464
MULTISPECTRAL BAND SCANNERS
Production of color composites form multispectral data records N80-20712
Thematic mapper versus multispectral scanner for crop monitoring N80-20778
Assessment of satellite and aircraft multispectral scanner data for strip-mine monitoring
[NASA-TM-79268] N80-20787
MULTISPECTRAL PHOTOGRAPHY
A method for examining relationships between multispectral data N80-20708
Possibilities of application of LANDSAT and Skylab data to small scale cartography N80-20710
MULTIVARIATE STATISTICAL ANALYSIS
Robust procedures for the multivariate normal distribution N80-21086
The use of the tetrachoric series for evaluating multivariate normal probabilities
[AD-A079721] N80-21093
MUONS
Deep inelastic muon scattering at Fermi Lab --- using a multimuon spectrometer
[COO-3000-T2] N80-21122
MUSCULOSKELETAL SYSTEM
Effect of space flight on sodium, copper, manganese and magnesium content in the skeletal bones
[NASA-TM-75506] N80-21025
MYOCARDIUM
Coagulating activity of the blood, vascular wall, and myocardium under hypodynamia conditions
[NASA-TM-76056] N80-21023

N

N-TYPE SEMICONDUCTORS
N-type molybdenum diselenide-based liquid junction solar cells: A non-aqueous electrolyte system employing the chlorine/chloride couple
[AD-A079712] N80-20871
NACELLES
Optimum subsonic, high-angle-of-attack nacelles
[NASA-TM-81491] N80-20275
NASA PROGRAMS
Overview of NASA battery technology program N80-20821
NASA/Marshall's lithium battery applications N80-20825
NASA patent abstracts bibliogrpahy. A continuing bibliography. Section 1: Abstracts, supplement 16
[NASA-SP-7039(16)] N80-21190
NATURAL GAS
Analysis of current trends in U.S. petroleum and natural gas production
[PB80-116056] N80-20800
Characterization and analysis of devonian shales as related to release of gaseous hydrocarbons
[ORO-5205-10] N80-20973
NATURAL LANGUAGE (COMPUTERS)
Advanced query techniques
[AD-A079626] N80-21192
NAVIER-STOKES EQUATION
Computation of axisymmetric separated nozzle-afterbody flow --- computer program for solving compressible nozzle flow using navierstokes equation
[AD-A079694] N80-20238
Complete supersonic flowfields over blunt bodies in a generalized orthogonal coordinate system
[NASA-TM-81784] N80-20529
Three-dimensional laminar solution of the Navier-Stokes equations using body-filtered coordinate systems, part 2
[AD-A080046] N80-20543
Numerical solution of the two-dimensional incompressible averaged Navier-Stokes equations for finite arbitrary shaped isolated bodies, part 1
[AD-A080093] N80-20544
NAVIGATION SATELLITES
NAVSTAR GPS civil applications study
[AD-A078277] N80-20257

Development of Doppler Observations at Wetzell during 1975-1976 N80-20698

NAVSTAR SATELLITES

Simulation of a navigator algorithm for a low-cost GPS receiver
[NASA-TM-81778] N80-20251

Combined pseudo range and Doppler positioning for the stationary NAVSTAR user
[AD-A079543] N80-20256

NAVY

High energy density battery development status report N80-20826

NEAR INFRARED RADIATION

Remote sensing of leaf water content in the near infrared N80-20768

NEGATIVE CONDUCTANCE

Theory and applications of negative differential resistance in the current-voltage characteristics of metal-insulator-metal diodes N80-20484

NEODYMIUM LASERS

Extending the Neodymium-YAG laser reflectance measuring system to lunar measurements at the Wetzell station N80-20695

NEON

Measures of the transverse differential effect for the rotary excitation of the molecule HD colliding with Ne and D2
[MPIS-16/1978] N80-21124

NETWORK ANALYSIS

Numerical methods for stiff nonlinear and quadratic differential equations
[AD-A079303] N80-21077

Simulating generalized semi-Markov processes
[AD-A075549] N80-21089

NETWORK SYNTHESIS

Optimization of horizontal control networks by nonlinear programming
[PB80-117948] N80-20976

NEUTRAL PARTICLES

Study of the interactions of rare gas molecules by measuring total and differential transverse scattering
[MPIS-15/1978] N80-21123

NEVADA

On the slection of station sites for observing strain streps and earthquake forerunners in California N80-20740

Assessment of low- to moderate-temperature geothermal resources of Nevada
[NVO-01556-1] N80-20792

Airborne laser fluorosensing of surface water chlorophyll a --- Lake Mead, Nevada
[PB80-113400] N80-20797

Nevada nuclear waste storage investigations
[NVO-196-11] N80-21129

NEW GUINEA (ISLAND)

Interpretation of geoid anomalies in the vicinity of subduction zones --- Tonga-Kermadec and the New Hebrides island arc, North Fiji, South Fiji and Lau-havre N80-20732

NEW HAMPSHIRE

Wind energy in the mountains of New Hampshire as a potential energy source for Portsmouth Naval Shipyard
[AD-A076975] N80-20868

NEW MEXICO

Geological/geophysical resource assessment --- Rio Grande rift N80-20725

An economical solar heated and cooled residence for southern New Mexico
[PB80-108616] N80-20914

Crystallization and metasomatism of the Cuchillo Mountain laccolith, Sierra County, New Mexico N80-20957

NEW YORK

A comparative study of the energy alternatives for the State of New York N80-20807

NEW ZEALAND

Gravity model development N80-20748

NICKEL

Reliability of energy dispersive X-ray fluorescence analysis of low-alloy steels
[AD-A077154] N80-20371

Nickel contaminated titanium weld wire study
[LTR-141-93] N80-20381

Exploratory studies in catalytic coal liquefaction
[EPRI-AF-1184] N80-20422

Nickel electrode plate thickening study N80-20858

NICKEL ALLOYS

The effect of plastic deformation on the transport of hydrogen in nickel
[AD-A077660] N80-20391

NICKEL CADMIUM BATTERIES

NATO: In-orbit experience N80-20836

RCA Satcom: In-orbit experience N80-20837

Update of the IUE battery in-flight performance N80-20838

Discussion of the SAGE anomaly N80-20839

ESA battery development N80-20840

Parallel 50 ampere hour nickel cadmium battery performance in the Modular Power Subsystems (MPS) N80-20841

NASA 50 amp hour nickel cadmium battery waste heat determination N80-20842

The 20 watt-hour per kilogram nickel cadmium energy storage for Intelsat V N80-20844

Pocket nickel cadmium cell and battery evaluation N80-20851

NWSC nickel cadmium spacecraft cell accelerated life test program data analysis N80-20852

Development of failure model for nickel cadmium cells N80-20854

Mission simulator test data --- an overview of a real time mission simulation test program of a nickel cadmium battery N80-20855

NICKEL COATINGS

Corrosion resistance of zinc-level plated U-0.75 Ti
[AD-A075539] N80-20373

NICKEL HYDROGEN BATTERIES

The practical limit of loading nickel hydroxide electrodes N80-20857

Intelsat-V: Nickel-hydrogen battery N80-20861

Air Force nickel-hydrogen flight experiment N80-20862

Nickel hydrogen cell characterization test results N80-20863

NIGHT

Estimating nocturnal surface temperature in Florida using thermal data from geostationary satellite data N80-20982

NIMBUS SATELLITES

Interactive digital satellite image processing system for oceanographic applications
[AD-A079697] N80-20790

NIOBIUM ALLOYS

Analytical electron microscope study of the omega phase transformation in a zirconium-niobium alloy
[COO-1198-1279] N80-20385

NITRIC OXIDE

A study by optical spectroscopy of chemiluminescent reactions between ions and molecules for N(+)+NO yields N2(+)* +O
[MPIS-4/1979] N80-21126

NITROGEN COMPOUNDS

Vapour pressures and critical points of liquids. 14: Aliphatic oxygen-nitrogen compounds
[ESDU-79030] N80-20329

NITROGEN IONS

A study by optical spectroscopy of chemiluminescent reactions between ions and molecules for N(+)+NO yields N2(+)* +O
[MPIS-4/1979] N80-21126

NOISE (SOUND)

Plasma cortisol levels and auditory functioning in humans exposed to short and prolonged durations of noise N80-21018

NOISE MEASUREMENT

Noise measurements and quality assurance
[PB80-107246] N80-21106

NOISE METERS

Noise measurements and quality assurance
[PB80-107246] N80-21106

NOISE REDUCTION

Noise suppression methods for robust speech processing
[AD-A079321] N80-20466

NONDESTRUCTIVE TESTS

Minicomputer controlled system for testing telemetry receiving and recording systems
[AD-A078803] N80-20305

Report on the acoustic emission examination of glass-fiber-reinforced plastic pipes
[UCRL-TRANS-11520] N80-20604

Acoustic emission: Who needs it and why? --- pressure vessel reliability
[HEDL-SA-1808-FP] N80-20605

Status of radiographic study, development, and new applications in the LASL Nondestructive Testing Group
[LA-UR-79-2648] N80-20606

NDT (Non-Destructive Test)/road correlation
[PB80-106636] N80-20607

NONLINEAR EQUATIONS

Applying integrals of motion to the numerical solution of differential equations
[NASA-TM-58225] N80-21059

On efficient time-stepping methods for nonlinear second order hyperbolic partial differential equations
[AD-A079731] N80-21074

Differential geometric methods for solving nonlinear constrained optimization problems and a related system of nonlinear equations: Global analysis and implementation
[BNL-26729] N80-21079

Lectures on the practical solution of differential equations
[ORNL/TM-6920] N80-21082

NONLINEAR FILTERS

System identification structural dynamics: An application to wind force estimation --- nonlinear dynamic programming filter N80-20435

NONLINEAR PROGRAMMING

Optimization of horizontal control networks by nonlinear programming
[PB80-117948] N80-20976

NONLINEAR SYSTEMS

Alternatives for jet engine control
[NASA-CR-162911] N80-20273

ANSR-2: Analysis of nonlinear structural response, user's manual
[PB80-113301] N80-20440

On the nonlinear deformation geometry of Euler-Bernoulli beams --- rotary wings
[NASA-TP-1566] N80-20619

Nonlinear static TPS analysis
[NASA-TM-81785] N80-20620

NONLINEARITY

Nonlinear wave process hierarchies and the cyclic development of quasi-ordered structures in turbulent shear flows
[AD-A079619] N80-20545

NORMAL DENSITY FUNCTIONS

Robust procedures for the multivariate normal distribution N80-21086

The use of the tetrachoric series for evaluating multivariate normal probabilities
[AD-A079721] N80-21093

NORTH AMERICA

Geophisical atlas N80-20734

Crustal deformation: Crustal dynamics project N80-20736

Investigation of crustal dynamics using VLBI N80-20737

Gravity model development N80-20748

NORTH CAROLINA

Crustal structure and dynamics of southeastern US --- Maryland, Virginia, North Carolina, South Carolina, West Virginia, Georgia, Tennessee, and Kentucky N80-20738

NORTH DAKOTA

Energy source book --- Colorado, Montana, North Dakota, South Dakota, Utah, and Wyoming
[DOE/TIC-10190] N80-20895

NOZZLE FLOW

Computation of axisymmetric separated nozzle-afterbody flow --- computer program for solving compressible nozzle flow using navierstokes equation
[AD-A079694] N80-20238

Downstream mixing gasdynamic lasers: A numerical solution --- of supersonic mixing flows below the nozzle exit N80-20572

NUCLEAR ELECTRIC POWER GENERATION

Environmental development plan for space applications --- development of nuclear power supplies for use in space
[DOE/EDP-0057] N80-20922

Selection of power plant elements for future reactor space electric power systems
[LA-7858] N80-21133

NUCLEAR FUEL ELEMENTS

Distribution of steady state temperatures and thermoelastic stresses in cylindrical shell with internal heat generation and cooled on both sides or only on one side
[GA-A-15509] N80-20634

NUCLEAR FUSION
Proceedings of USSR-Japan Joint Seminar on Plasma Diagnostics
[IPPJ-438] N80-21154
Deflagration wave formed by ion beam. Part 3: With energy of direct fusion reaction
[IPPJ-435-PT-3] N80-21156
Fusion technology development
[DOE/ET-0116/1] N80-21165

NUCLEAR INTERACTIONS
Nuclear collision at E/A is equivalent to T/ sub F/
[LBL-9520] N80-21121

NUCLEAR PARTICLES
Nuclear collision at E/A is equivalent to T/ sub F/
[LBL-9520] N80-21121

NUCLEAR PHYSICS
Program in medium energy physics research
[COO-2146-13] N80-21119
Unified gauge theories in nuclear physics
N80-21127

NUCLEAR REACTORS
Acoustic emission monitoring of steel and concrete structural elements with particular reference to primary nuclear containment structures
[CONF-790966-1] N80-21105

NUCLEAR RESEARCH
Program in medium energy physics research
[COO-2146-13] N80-21119
Research program in theoretical high-energy physics
[COO-3130TA-347] N80-21137

NUCLEONS
Nuclear collision at E/A is equivalent to T/ sub F/
[LBL-9520] N80-21121

NUMERICAL ANALYSIS
Investigation of numerical techniques for predicting aerodynamic heating to flight vehicles
[AD-A078121] N80-20234
Analysis of the consolidation of layered soils using the method of lines
[PB80-112766] N80-20447
On the physical realizability of broad-band equivalent circuits for wire loop and dipole antennas
[AD-A079961] N80-20498
Determination of forces on arbitrary concave bodies in high speed rarefied gases
[LOG-J11513] N80-20530
Recent developments in computational techniques for applied hydrodynamics
[AD-A079305] N80-20539
Some new mathematical methods for variational objective analysis using splines and cross validation
[AD-A079302] N80-21067
A globally convergent ball newton method
[AD-A079726] N80-21072
On subharmonic solutions of Hamiltonian systems
[AD-A079729] N80-21073
Numerical study of current-driven collisional drift and alfven instabilities in a sheared magnetic field
[IPPJ-436] N80-21157

NUMERICAL CONTROL
Compliance and force control for computer controlled manipulators
[AD-A077708] N80-21054

NUMERICAL INTEGRATION
Applying integrals of motion to the numerical solution of differential equations
[NASA-TM-58225] N80-21059
Practical aspects of Gaussian integration
[AD-A079030] N80-21076

NUMERICAL WEATHER FORECASTING
Meteorological data, series A monographs. Volume 3, no. 1: A study of prediction of characteristic synoptic structures with the aid of a numerical model of the humid atmosphere N80-20984

O

OBLIQUE SHOCK WAVES
Calculation of oblique-shock-wave laminar-boundary-layer interaction on a flat plate
[NASA-CR-159829] N80-20531

OCEAN BOTTOM
Gravity model development N80-20748

OCEAN CURRENTS
Remote sensing of ocean surface current and current shear by HF backscatter radar N80-20718
Ocean circulation N80-20761

OCEAN DATA ACQUISITIONS SYSTEMS
Wave sensor survey
[PB80-118581] N80-21010

OCEAN SURFACE
Remote sensing of ocean surface current and current shear by HF backscatter radar N80-20718
The effect of sea state on altimeter measurements
N80-20759
Mean sea surface computation using GEOS-3 altimeter data N80-20760
Wave sensor survey
[PB80-118581] N80-21010

OCEANOGRAPHY
Earth Survey Applications Division: Research leading to the effective use of space technology in applications relating to the Earth's surface and interior
[E80-10084] N80-20722
Earth survey applications division: Research leading to the effective use of space technology in applications relating to the Earth's surface and interior
[E80-10087] N80-20723
Ocean circulation N80-20761
Starlette orbit analyses for ocean tidal studies
N80-20762
Interactive digital satellite image processing system for oceanographic applications
[AD-A079697] N80-20790
Delaware sea grant college program
[PB80-122401] N80-21011
Hydrographic observations in the Georgia Bight (April 1978)
[PB80-111453] N80-21012
European scientific notes, volume 33, number 11
[AD-A079711] N80-21241

OCEANS
The enhanced nodal equilibrium ocean tide and polar motion N80-20754

OFFSHORE ENERGY SOURCES
Environmental assessment of an active oil field in the northwestern Gulf of Mexico, 1977 - 1978. Volume 3: Chemical and physical investigations
[PB80-107899] N80-20939

OFFSHORE PLATFORMS
Computer manual for calculating wave-height distributions about offshore structures
[PB80-109150] N80-21013

OIL EXPLORATION
Analysis of current trends in U.S. petroleum and natural gas production
[PB80-116056] N80-20800

OIL FIELDS
Analysis of water resources requirement for the enhanced (tertiary) oil recovery in the southern plains region of the United States
[PB80-110869] N80-20801
Adequacy analysis of air quality monitoring activities relevant to California thermal enhanced oil recovery fields
[SAN-12093-1] N80-20929
Environmental assessment of an active oil field in the northwestern Gulf of Mexico, 1977 - 1978. Volume 3: Chemical and physical investigations
[PB80-107899] N80-20939

OIL POLLUTION
Microwave remote sensing technology for the marine oil pollution surveillance
[REPT-202] N80-20786

OIL RECOVERY
Analysis of water resources requirement for the enhanced (tertiary) oil recovery in the southern plains region of the United States
[PB80-110869] N80-20801
Adequacy analysis of air quality monitoring activities relevant to California thermal enhanced oil recovery fields
[SAN-12093-1] N80-20929

OMEGA NAVIGATION SYSTEM
Analysis of first and second order binary quantized digital phase-locked loops for ideal and white Gaussian noise inputs
[NASA-CR-162841] N80-20250

ONBOARD EQUIPMENT
F-4 Phantom aircrew survival equipment evaluation
[AD-A076330] N80-20245

OPACITY
Aerosol filter loading data for a simulated jet engine test cell aerosol
[AD-A078779] N80-20287

OPERATIONS RESEARCH
Methodology for evaluating physical constraints on residential solar energy use
[UCRL-15001] N80-20901
European scientific notes, volume 33, number 11
[AD-A079711] N80-21241

OPERATORS (MATHEMATICS)
On the maximality of the sum of two maximal monotone operators
[AD-A079724] N80-21070

OPTICAL DATA PROCESSING
Graphic production of maps on screens or photocomposition devices N80-20659
Reports on cartography and topographical measurements. Series 2: Translations — computer assisted data correlation
[REPT-35] N80-20679
ADP-supported color separation N80-20684
Investigation of direct integrated optics modulators — applicable to data preprocessors
[NASA-CR-162894] N80-21143

OPTICAL MEASURING INSTRUMENTS
Digital waveform recording and computer analysis of acoustic emission and ultrasonic transients detected by optical and piezoelectric probes N80-20558
Noncontacting method for measuring angular deflection
[NASA-CASE-LAR-12178-1] N80-21138
AMTV headway sensor and safety design
[NASA-CR-162717] N80-21203

OPTICAL PROPERTIES
Optical analysis and optimization of line focus collectors
[SERI/TR-34-092] N80-20893
Optical determination of the properties of excitons bound to impurities in semiconductors N80-21139

OPTICAL PUMPING
Investigation of Hg2 as a discharge pumped optical storage medium
[COO-4630.A000-1] N80-20582

OPTICAL SCANNERS
Velocity servo for continuous scan Fourier interference spectrometer
[NASA-CASE-NPO-14093-1] N80-20563

OPTICAL WAVEGUIDES
Ultrapure glass optical waveguide development in microgravity by the sol-gel process
[NASA-CR-162910] N80-21142

OPTIMAL CONTROL
Optimal flow control of air traffic
[PB80-105976] N80-20258
Optimization of horizontal control networks by nonlinear programming
[PB80-117948] N80-20976
Improvement of a process to identify the parameters for the optimal control model (BBN)
[ILR-40] N80-21055

OPTIMIZATION
Transient response optimization of piezoelectric disc transducers by time domain techniques — demonstrating design procedures for reducing mechanical ringing N80-20561
Line generalization and data reduction from a mathematical optimization point of view N80-20678
Adaptation and optimization of a line-by-line radiative transfer program for the STAR-100 (STARSMART)
[NASA-CR-159238] N80-21044
Sensitivity adaptive control of a magnetic suspension system
[AD-A077148] N80-21052
Abstract optimality theory
[AD-A079707] N80-21069
On the maximality of the sum of two maximal monotone operators
[AD-A079724] N80-21070
Differential geometric methods for solving nonlinear constrained optimization problems and a related system of nonlinear equations: Global analysis and implementation
[BNL-26729] N80-21079

ORBIT CALCULATION
Orbital estimation using two-body classical orbital elements as measurement updates
[AD-A079903] N80-20290
Application and comparison of stable periodic orbits in the vicinity of Lagrangian points L4 and L5 to a four-body truth model
[AD-A079683] N80-20293

Effect of linear approximation for satellite Doppler frequency in geodetic positioning
[AD-A078129] N80-20299
On the use of lines of kernel functions for orbital determination N80-20701
Information relative to cartography and geodesy. Series 2: Translations
[REPT-37] N80-20714
On orbital fitting with altimeter data N80-20715

ORBIT DECAY
Unexplained Lageos perturbation N80-20751

ORBIT PERTURBATION
On the production of long-period comets by stellar perturbations of the Oort comet clouds --- calculation of orbital perturbation of comets around the Sun due to passing stars N80-21231

ORBITAL ELEMENTS
Orbital estimation using two-body classical orbital elements as measurement updates
[AD-A079903] N80-20290
Application and comparison of stable periodic orbits in the vicinity of Lagrangian points L4 and L5 to a four-body truth model
[AD-A079683] N80-20293
Research program 78, satellite geodesy program
[ASTRON-GEODAET-ARB-38] N80-20691

ORBITAL MANEUVERS
Use of an aerodynamic turn to maximize the orbit inclination change for the space shuttle orbiter
[AD-A079855] N80-20291

ORBITAL MECHANICS
Stabilizing an unstable orbit about L3 in the Sun, Earth, Moon system using linear constant gain feedback
[AD-A079860] N80-20292

ORBITAL POSITION ESTIMATION
Orbital estimation using two-body classical orbital elements as measurement updates
[AD-A079903] N80-20290

ORBITS
Application and comparison of stable periodic orbits in the vicinity of Lagrangian points L4 and L5 to a four-body truth model
[AD-A079683] N80-20293

ORGANIC COMPOUNDS
Thermodynamics of organic compounds --- ramjet fuels
[AD-A080072] N80-20410
High pressure photophysics of organic molecules
[COO-1198-1278] N80-21113
Treatment of organic chemical manufacturing wastewater for reuse
[PB80-105166] N80-21217

ORGANIC MATERIALS
Performance of a gel permeation chromatograph and its usefulness in examining mixtures of organic materials --- liquid chromatography analysis of epoxy resins
[AD-A079953] N80-20346

ORGANIC WASTES (FUEL CONVERSION)
Production of methane using an anaerobic filter
[ANL-TRANS-1164] N80-20428

ORGANOMETALLIC COMPOUNDS
Molecular orbital criteria for reductive elimination from organotransition-metal complexes
[AD-A079447] N80-20344

ORIFICE FLOW
Fluid and thermodynamic characteristics of compressible recoil
[AD-A078587] N80-20548

ORTHOPHOTOGRAPHY
Photogrammetry in IFAG from 1952 to 1977 N80-20664

ORTHOTROPIC PLATES
Effect of imperfections on the collapse of rectangular plates using variational calculus
[AD-A079905] N80-20627

OSCILLATING FLOW
Oscillating flow about tube bundles
[AD-A078269] N80-20534

OSCILLATION DAMPERS
Apparatus for damping operator induced oscillations of a controlled system --- using adaptive filters to damp oscillations in a flight control system
[NASA-CASE-FRC-11041-1] N80-20488

OSO-8
Analysis of time dependent phenomena observed with the LPSP OSO-8 instrument --- solar chromosphere and photosphere
[NASA-CR-162908] N80-21237

OUTGASSING
Black chrome outgassing study
[UCRL-82797] N80-20389

OVERPRESSURE
TNT equivalency of benite propellant --- to determine overpressure for propellant storage
[AD-A077108] N80-20406

OXIDATION-REDUCTION REACTIONS
Catalyst surfaces for the chromous/chromic redox couple
[NASA-CASE-LEW-13148-1] N80-20487

OXYGEN
Direct observation of the reactions of the atom O(1D) with halogen compounds of methane and with methane and water
[MPIS-25/1978] N80-21125
Compensation mechanisms in GaAs. Study of chrome and oxygen in this material and their influence in obtaining semi-insulating GaAs
[LEP-79/640.SME-645-C] N80-21182

OXYGEN COMPOUNDS
Vapour pressures and critical points of liquids. 14: Aliphatic oxygen-nitrogen compounds
[ESDU-79030] N80-20329

OZONE
ISS/SIMS characterization of UV/O sub 3 cleaned surfaces
[AD-A078425] N80-20375
Ozone and ultraviolet radiation disinfection for small community water systems
[PB80-108418] N80-21220

P

P-N JUNCTIONS
Studies of P-N junction silicon solar cells N80-20809

PACIFIC ISLANDS
Interpretation of geoid anomalies in the vicinity of subduction zones --- Tonga-Kermadec and the New Hebrides island arc, North Fiji, South Fiji and Lau-havre N80-20732

PACIFIC OCEAN
The gravity field in the central pacific from satellite-to-satellite tracking and implications for mantle convection N80-20750
Equatorial Pacific Ocean variability-seasonal and El Nino time scales N80-21007

PACKAGING
Evaluation of packaging for the CN-1325/ASN-108 AHRS displacement gyro, F-15 aircraft
[AD-A078707] N80-20264

PADE APPROXIMATION
Dynamic buckling of a rigid-plastic cylindrical shell: A second order differential equation subject to four boundary conditions
[COO-4122-29] N80-20636

PAINTS
X-ray diffraction analysis of selected paint pigments --- traffic paints
[PB80-113061] N80-20401

PANEL FLUTTER
Development of stability methods for applications to nonlinear aeroelastic optimization
[AD-A077851] N80-20282

PANELS
A calculating technique for the flow field around a hydraulic turbine --- panel method
[ILR-37] N80-20553
Analytical/experimental investigation of the instability of composite cylindrical panels
[AD-A079850] N80-20628

PARALLEL PROCESSING (COMPUTERS)
Fast parallel realization of matrix multiplication
[AD-A080074] N80-21063
Impact of vector processors on algorithms
[LA-8123-MS] N80-21080

PARAMETERIZATION
Sampled-data analysis in parameter space
[AD-A077879] N80-20297
Calculation of the singularity expansion method parameters from the transient response of a thin wire
[AD-A078852] N80-20457
On correlation parameters for some binary sequences of lengths 31 and 63 for spread-spectrum multiple-access communications
[AD-A077152] N80-20464

PARAMETRIC AMPLIFIERS
PARRAY technical papers presented at scientific and technical meetings
[AD-A077726] N80-21104

PARITY
Parity nonconservation in polarized electron scattering at high energies
[SLAC-PUB-2409] N80-21173
Parity violation in deep inelastic electron scattering
[SLAC-PUB-2432] N80-21178

PARKS
Major uses of land in the United States, 1974
[PB80-114226] N80-20796

PARTIAL DIFFERENTIAL EQUATIONS
On efficient time-stepping methods for nonlinear second order hyperbolic partial differential equations
[AD-A079731] N80-21074

PARTICLE ACCELERATION
Accelerating particles in general relativity (stationary C-metric) N80-21184

PARTICLE ACCELERATORS
Impact fusion with a segmented rail gun
[AD-A079811] N80-20307

PARTICLE COLLISIONS
Theoretical analysis of perturbation solutions to the problem of inertial capture of aerosol particles
[RLO-2227-727-7] N80-20927
Coherence in penning ionization and first kind collisions: Volume recombination of ions/electrons
[AD-A079742] N80-21107
Angular momentum transfer in deeply inelastic collisions
[RLO-1388-395] N80-21111
Program in medium energy physics research
[COO-2146-13] N80-21119
Kaon-proton backward elastic scattering between 476 and 1084 MeV/c
[LBL-8969] N80-21120
Nuclear collision at E/A is equivalent to T/ sub F/
[LBL-9520] N80-21121
Collisional effects on electrostatic waves in isotropic plasmas N80-21150

PARTICLE DENSITY (CONCENTRATION)
Spacecraft test chamber contamination study in the AEDC Mark I facility
[AD-A079638] N80-20296

PARTICLE DIFFUSION
The Boltzmann equation with a soft potential. Part 1: Linear, spatially-homogeneous
[AD-A079706] N80-21068

PARTICLE INTERACTIONS
Comparison of jet size in anti-neutrino proton interactions with that in positron electron annihilation
[ANL-HEP-PR-79-17] N80-21117
Dense and dilute instanton-anti-instanton pair configurations
[COO-1545-263] N80-21118
Program in medium energy physics research
[COO-2146-13] N80-21119
High energy particle physics research
[SAN-0034-191-T1] N80-21136

PARTICLE MOTION
Evolution of turbulence by three-dimensional numerical particle-vortex tracing N80-20523

PARTICLE SIZE DISTRIBUTION
Gas flow in fluidized beds of large particles: Experiment and theory N80-20525
Effect of weather at Hannover, Federal Republic of Germany, on performance of electrooptical imaging systems. Part 3: Uncertainties in comparison of FLIR performance in the 3-5 and 8-12 micrometers bands
[AD-A079574] N80-21147
Optical detection of fiber particles in water --- Lake Superior
[PB80-116866] N80-21148
Techniques for measuring the alpha-particle distribution in magnetically confined plasmas
[PPPL-1592] N80-21164

PARTICLE THEORY
Dense and dilute instanton-anti-instanton pair configurations
[COO-1545-263] N80-21118

PARTICLES
Evaluation of exhaust collection configuration on diesel particulate measurement
[PB80-104995] N80-20941

PARTICULATE SAMPLING
Prototype particulate stack samplers with single-cut nozzle and microcomputer calculating/display system
[LA-UR-79-2421] N80-20923
Optical detection of fiber particles in water --- Lake Superior
[PB80-116866] N80-21148
PARTITIONS (MATHEMATICS)
Lump partitioning of integrated-circuit bipolar transistor models for high-frequency applications N80-20482
Theoretical study of steady vortex rings in the case of variable partitioning of the force
[MPIS-29/1978] N80-20554
PASSIVITY
Application of inelastic electron tunneling spectroscopy to the study of inhibition of aluminum corrosion N80-20367
PATENT POLICY
NASA patent abstracts bibliogrpahy. A continuing bibliography. Section 1: Abstracts, supplement 16
[NASA-SP-7039(16)] N80-21190
Patent policy, part 2
[GPO-58-551] N80-21199
PATHOLOGICAL EFFECTS
Model for measuring the health impact from changing levels of ambient air pollution: Morbidity study
[PB80-107030] N80-21027
PATTERN RECOGNITION
Report of the IGP Working Group 7-9 'Spectral Signatures of Objects' N80-20713
Texture primitive extraction using an edge-based approach
[AD-A078085] N80-21051
PAVEMENTS
Airfield pavement evaluation, volume 4. A bibliography with abstracts
[NTIS/PS-79/0754/6] N80-20288
The pressuremeter: Application of pavement design --- airport runways N80-20432
Structural evaluation of sulphur-asphalt pavements N80-20436
Statewide survey of skid resistances of pavements, 1978
[PB80-106404] N80-20442
Pavement recycling-bituminous concrete and concrete mix designs
[PB80-106263] N80-20443
Statistical investigation of pavement skid resistance data
[PB80-116114] N80-20446
PEAT
Synthetic fuels from peat gasification
[CONF-790803-55] N80-20412
PENALTY FUNCTION
Abstract optimality theory
[AD-A079707] N80-21069
PENNING EFFECT
Coherence in penning ionization and first kind collisions: Volume recombination of ions/electrons
[AD-A079742] N80-21107
PENNSYLVANIA
Remote monitoring of forest cover conditions --- deciduous tree defoliation in Pennsylvania N80-20763
Surface mine monitoring --- Pennsylvania N80-20764
PERFORMANCE TESTS
Evaluation of packaging for the CN-1325/ASN-108 AHRS displacement gyro, F-15 aircraft
[AD-A078707] N80-20264
Performance of a gel permeation chromatograph and its usefulness in examining mixtures of organic materials --- liquid chromatography analysis of epoxy resins
[AD-A079953] N80-20346
PERIODICALS
Energy information data base
[DOE/TIC-4579-R10-SUPPL-6] N80-20881
Mariners weather log
[PB80-113277] N80-20994
PERMAFROST
Periglacial research
[AD-A079280] N80-20967
PEROVSKITES
Ion implantation in perovskite type ferroelectrics
[AD-A080078] N80-20495
PERTURBATION THEORY
Theoretical analysis of perturbation solutions to the problem of inertial capture of aerosol particles
[RLO-2227-727-7] N80-20927
PETROLEUM PRODUCTS
Indicatory fate study
[PB80-102809] N80-20942
PETROLOGY
Regional modeling: The Ivrea zone --- Northern Italy N80-20731
Determination of basalt physical and thermal properties at varying temperatures, pressures, and moisture contents
[RHO-BWI-C-55] N80-20971
Determination of basalt physical and thermal properties at varying temperatures, pressures, and moisture contents
[RHO-BWI-C-54] N80-20972
PHASE LOCKED SYSTEMS
Analysis of first and second order binary quantized digital phase-locked loops for ideal and white Gaussian noise inputs
[NASA-CR-162841] N80-20250
An acquisition aid for a phase locked loop --- using an iterative technique N80-20485
PHASE TRANSFORMATIONS
Role of cluster size and surface on phase transitions N80-20331
Analytical electron microscope study of the omega phase transformation in a zirconium-niobium alloy
[COO-1198-1279] N80-20385
Phase transitions in lattice gauge theories N80-21172
PHENOLOGY
Effects of wheat irrigation frequency on reflectance in selected spectral bands --- Phoenix, Arizona N80-20771
Review of ionospheric distrubances resulting from some naturally occuring events
[LA-7984-MS] N80-20970
PHOTOCHEMICAL REACTIONS
Design of photochemical reaction chamber --- to study exhaust gases from coal fired power plants
[PB80-100654] N80-20360
Photochemical conversion of coal to gasoline in an entrained bed reactor
[ORO-5020-T1] N80-20415
High pressure photophysics of organic molecules
[COO-1198-1278] N80-21113
PHOTODECOMPOSITION
Models for the photoelectrolytic decomposition of water at semiconducting oxide anodes
[AD-A079469] N80-20343
PHOTODIODES
Electrooptical devices --- including semiconductor lasers and photodiodes
[AD-A077153] N80-20576
PHOTOELASTIC ANALYSIS
Use of two-dimensional transmission photoelastic models to study stresses in double-lap bolted joints: Load transfer and stresses in the inner lap
[VPI-E-80-9] N80-20621
States of stress and strain in adhesive joints, including photoelastic imaging of defects in adherends
[AD-A079515] N80-20631
PHOTOELECTRIC CELLS
Noncontacting method for measuring angular deflection
[NASA-CASE-LAR-12178-1] N80-21138
PHOTOGEOLOGY
Plate boundary deformation in California --- Southern California: Elsinore, Earthquake Valley, and San Felipe Faults N80-20739
PHOTOGRAMMETRY
Cartography applications and research N80-20654
Photogrammetry in IFAG from 1952 to 1977 N80-20664
On spectral signatures in central perspective representation N80-20665
Orthophoto techniques and photomaps N80-20666
Digital height model with ITEK correlator N80-20669
Digital map bases from photogrammetric measurements N80-20671
Tasks and possibilities of digital image data processing in photogrammetry N80-20672
Airport obstacle maps N80-20673
Reports on cartography and topographical measurements. Series 1: Original reports
[REPT-77] N80-20705
Contributions to the creation of a conclusive system of concepts of photogrammetry and aerial photograph cartography N80-20706
The problem of obtaining data for the Digital Height Model N80-20707
PHOTOGRAPHIC PROCESSING
Production of color composites form multispectral data records N80-20712
PHOTOINTERPRETATION
On spectral signatures in central perspective representation N80-20665
Application of LANDSAT imagery to monitor sand dunes movement in the Sahara Desert N80-20719
Interactive aids for cartography and photo interpretation
[AD-A079553] N80-20789
PHOTOIONIZATION
Photoionization studies of molecular dynamics and energetics
[AD-A079814] N80-21110
Molecular beam photoionization and gas-surface scattering
[LBL-9838] N80-21177
PHOTOMAPPING
The future of analytical evaluation equipment --- image measurement techniques N80-20670
Digital map bases from photogrammetric measurements N80-20671
Twenty-five years of aerial photography by the Institute of Applied Geodesy N80-20676
Possibilities of application of LANDSAT and Skylab data to small scale cartography N80-20710
PHOTOMAPS
The production of photomaps from tidal flat areas N80-20682
NASA-census Application Pilot Test (APT) and urban area delineation studies --- Seattle, Washington; Austin, Texas; Orlando, Florida; Boston, Massachusetts, and Richmond, Virginia N80-20765
PHOTOSPHERE
Analysis of time dependent phenomena observed with the LPSP OSO-8 instrument --- solar chromosphere and photosphere
[NASA-CR-162908] N80-21237
Doppler observations of solar rotation
[NASA-CR-162886] N80-21238
PHOTOVOLTAIC CELLS
Comparison of theoretical and experimental solar cell performance N80-20806
Market definition study of photovoltaic power for remote villages in the United States
[NASA-CR-159800] N80-20812
Use of Glass Reinforced Concrete (GRCD) as a substrate for photovoltaic modules
[NASA-CR-162898] N80-20819
The Exxon rechargeable cells --- solar rechargeable clocks N80-20834
Design and fabrication of prototype combined photovoltaic/thermal non-tracking collector
[SAND-79-7014] N80-20899
PHYSIOLOGICAL EFFECTS
Plasma cortisol levels and auditory functioning in humans exposed to short and prolonged durations of noise N80-21018
PIEZOELECTRIC CRYSTALS
CDS solid state phase insensitive ultrasonic transducer --- annealing cadmium sulfide crystals
[NASA-CASE-LAR-12304-1] N80-20559
PIEZOELECTRIC TRANSDUCERS
Fabrication, characterization and optimization of posfet (PVF2-silicon) piezoelectric transducers for low frequency 100 Hz to 500 KHz underwater acoustic applications
[AD-A079113] N80-20500
Digital waveform recording and computer analysis of acoustic emission and ultrasonic transients detected by optical and piezoelectric probes N80-20558
Transient response optimization of piezoelectric disc transducers by time domain techniques --- demonstrating design procedures for reducing mechanical ringing N80-20561
PIGMENTS
X-ray diffraction analysis of selected paint pigments --- traffic paints
[PB80-113061] N80-20401

PILOT PERFORMANCE
Summary of Department of Transportation/Federal Aviation Administration task force on crew workload report
[AD-A068189] N80-21032
PIPE FLOW
Fluid flow through a partially filled cylinder --- laminar flow N80-20516
Separation control in all apt light pipe
[AD-A079904] N80-20577
PIPES (TUBES)
Report on the acoustic emission examination of glass-fiber-reinforced plastic pipes
[UCRL-TRANS-11520] N80-20604
PISTON ENGINES
Exhaust emissions characteristics for a general aviation light-aircraft Teledyne Continental Motors (TCM) GTSIO-520-K piston engine
[AD-A080433] N80-20270
PITCHING MOMENTS
An approximate analysis of wing unsteady aerodynamics
[AD-A079322] N80-20239
Wing/store flutter with nonlinear pylon stiffness
[NASA-TM-81789] N80-20280
The effects of pitching rate on the hydrodynamic properties of hydrofoils
[AD-A079810] N80-20438
Human comfort response to random motions with a dominant pitching motion
[NASA-CR-159140] N80-21034
PITOT TUBES
A calibration of the Preston tube in liquid flow systems
[AD-A079876] N80-20538
PLANETARY EVOLUTION
Hotspots and the evolution of the mantle
[NASA-CR-162906] N80-20964
PLANETARY GRAVITATION
Comparison of algorithms for the summation of spherical plane functions N80-20699
PLANETARY MAGNETIC FIELDS
Outer satellite atmospheres: Their extended nature and planetary interactions --- sodium cloud of Io, hydrogen torus of Titan, and comet atmospheres
[NASA-CR-162902] N80-21235
PLANETARY MASS
A determination of GM N80-20756
PLANETARY STRUCTURE
Comparative planetology/crustal evolution N80-20735
PLANETOLOGY
Comparative planetology/crustal evolution N80-20735
PLANTS (BOTANY)
Remote sensing of leaf water content in the near infrared N80-20768
Plant stress and relationships to spectral responses --- cotton and tomato plants N80-20769
Effects of wheat irrigation frequency on reflectance in selected spectral bands --- Phoenix, Arizona N80-20771
Assessing soybean leaf area and leaf biomass by spectral measurements --- Beltsville, Maryland Agricultural Research Center N80-20775
Spectra of isolated vegetational constituents N80-20779
Decline of submerged aquatic plants in Chesapeake Bay
[PB80-114747] N80-21009
PLASMA CLOUDS
Preliminary report of numerical simulations of intermediate wavelength ExB gradient drift instability in ionospheric plasma clouds
[AD-A079313] N80-20968
PLASMA CONTROL
Divertor experiments in a toroidal plasma, with ExB drift due to an applied radial electric field N80-21151
Formation of toroidal plasma confinement configuratons by using hot electrons
[UCID-18239] N80-21161
Techniques for measuring the alpha-particle distribution in magnetically confined plasmas
[PPPL-1592] N80-21164
PLASMA DIAGNOSTICS
Proceedings of USSR-Japan Joint Seminar on Plasma Diagnostics
[IPPJ-438] N80-21154
Vacuum ultraviolet spectroscopic study of plasma impurities in the Tokapole 2 poloidal divertor experiment
[COO-2387-111] N80-21162
PLASMA ELECTRODES
High power ion-irradiation test for CTR first wall --- using a plasma anode
[IPPJ-437] N80-21158
PLASMA FREQUENCIES
Velocity space instabilities of alpha particles in Tokamak reactors --- plasma frequency instabilities due to hollow isotropic alpha velocity distributions
[DOE/TIC-11016] N80-21167
PLASMA INTERACTIONS
Strongly turbulent stabilization of electron beam-plasma interactions
[NASA-CR-162843] N80-21159
PLASMA PHYSICS
Research activities of the Institute for Extraterrestrial Physics
[MPI-PAE/EXTRATERR-150] N80-21223
PLASMA TURBULENCE
Strongly turbulent stabilization of electron beam-plasma interactions
[NASA-CR-162843] N80-21159
PLASMA-PARTICLE INTERACTIONS
Deflagration wave formed by ion beam. Part 3: With energy of direct fusion reaction
[IPPJ-435-PT-3] N80-21156
PLASMAPAUSE
Research activities of the Institute for Extraterrestrial Physics
[MPI-PAE/EXTRATERR-150] N80-21223
PLASMAS (PHYSICS)
AFSIM, an Air Force sattellite interactions model
[AD-A078032] N80-20300
Backscattering of electromagnetic waves from electrostatic waves in a magnetized plasma N80-21153
Deflagration wave formed by ion beam. Part 3: With energy of direct fusion reaction
[IPPJ-435-PT-3] N80-21156
PLASTIC DEFORMATION
Large-strain deformation of a mild steel at intermediate temperatures N80-20369
The effect of plastic deformation on the transport of hydrogen in nickel
[AD-A077660] N80-20391
An analysis of plastic shock waves in snow
[AD-A080051] N80-20467
Rigid-plastic finite-element analysis of plastic deformation in metal-forming processes
[AD-A078987] N80-20630
Dynamic buckling of a rigid-plastic cylindrical shell: A second order differential equation subject to four boundary conditions
[COO-4122-29] N80-20636
Mechanical properties of crystalline solids --- transient deformation, grain boundary, sliding, and grain boundary cavitation processes in Zircaloys
[COO-2172-29] N80-21180
PLATE THEORY
Vibration of plates of various geometries N80-20613
PLATES (STRUCTURAL MEMBERS)
Closed cell structures using triangular plates N80-20615
PLOTTERS
Experiences gathered with a symbol disk with interchangeable symbols N80-20688
Setting data from multistage analytical orientation N80-20709
On the writing accuracy of the reproduction unit of the Optronics System P1700 N80-20711
PLOTTING
Computer-assisted thematic mapping for federal planning N80-20686
PLUMES
User's guide for numerical modeling of buoyant plumes in a turbulent, stratified atmosphere
[PB80-114549] N80-20946
PLUTONIUM
Chemistry research and development --- americium and plutonium recovery and purification
[RFP-2952] N80-20309
Decontamination of metals containing plutonium and americium
[ANL-78-13] N80-20599
PLUTONIUM OXIDES
Environmental development plan for space applications --- development of nuclear power supplies for use in space
[DOE/EDP-0057] N80-20922
POINTING CONTROL SYSTEMS
Example of performance analysis using data obtained concurrently in air-path, body and Earth axes
[ESDU-79018] N80-20225
POLAR ORBITS
Satellite activities of NOAA 1978 --- geostationary and polar orbiting systems
[PB80-112782] N80-21002
POLAR REGIONS
Crustal anomaly representation N80-20728
Investigation of crustal dynamics using VLBI N80-20737
Information theory density distribution --- Earth Mantle N80-20753
The enhanced nodal equilibrium ocean tide and polar motion N80-20754
Polar motion research N80-20755
Polar motion and Earth rotation results from Lageos N80-20757
POLAR WANDERING (GEOLOGY)
The enhanced nodal equilibrium ocean tide and polar motion N80-20754
Polar motion research N80-20755
Polar motion and Earth rotation results from Lageos N80-20757
POLISHING
Grinding and polishing articles in bulk: Burnishing
[NASA-TM-75774] N80-20590
POLLUTION
Interpretation of environmental assessment data
[PB80-108160] N80-20933
POLLUTION CONTROL
Effect of water injection and off scheduling of variable inlet guide vanes, gas generator speed and power turbine nozzle angle on the performance of an automotive gas turbine engine
[NASA-TM-81415] N80-20272
Aerosol filter loading data for a simulated jet engine test cell aerosol
[AD-A078779] N80-20287
Survey of instrumentation for environmental monitoring: Major update. Volume 3: Radiation
[LBL-1-VOL-3] N80-20925
Application of germanium detectors to environmental monitoring
[PB80-113624] N80-20936
Development of superior entrainment separators
[PB80-112394] N80-20938
Evaluation of exhaust collection configuration on diesel particulate measurement
[PB80-104995] N80-20941
Development of an example control strategy for lead
[PB80-123029] N80-20943
Further characterization of sorbents for environmental sampling
[PB80-118763] N80-20944
Control technologies for particulate and tar emissions from coal converters
[PB80-108392] N80-20949
Hot gas cleanup process
[PB80-108467] N80-20950
Development of droplet sizing for the scrubbing systems
[PB80-108574] N80-20954
POLLUTION MONITORING
Adequacy analysis of air quality monitoring activities relevant to California thermal enhanced oil recovery fields
[SAN-12093-1] N80-20929
Beta gauge operation manual
[PB80-112337] N80-20937
Light-duty diesel gaseous emissions measurement - comparison of dilution tunnel test results to certification cell test results
[PB80-115991] N80-20945
Development of a biological simulation monitor for joint municipal/industrial treatment systems
[PB80-111032] N80-20951
Remote sensing applied to pollution monitoring. Citations from the International Aerospace Abstracts data base
[NTIS/PS-79/0732/2] N80-20952

Basic studies flow and diffusion over hills
[PB80-112014] N80-20998

POLYCRYSTALS
Low cost thin film polycrystalline silicon solar cells
[DOE/ET-23048/1] N80-20906

POLYHEDRONS
Space truss design: The polyhedral chain group
N80-20434

POLYIMIDE RESINS
Design, fabrication and test of graphite/polyimide composite joints and attachments for advanced aerospace vehicles
[NASA-CR-159110] N80-20316

POLYMER CHEMISTRY
The development of an electrochemical method for the determination of the effective volume of charged polymers in solution and its application to continuing studies of metal ion binding polyelectrolytes
N80-20332
Synthesis, characterization, and properties of isoprene-methyl methacrylate copolymers
N80-20395

POLYMER MATRIX COMPOSITE MATERIALS
Development of LaRC 160/NR150B2 polyimide graphite hybrid composites --- for shuttle applications
[NASA-CR-159196] N80-20315
Structure and properties of glasses --- beryllium fluoride glass
[AD-A080071] N80-20400

POLYMER PHYSICS
Synthesis, characterization, and properties of isoprene-methyl methacrylate copolymers
N80-20395

POLYMERIZATION
Electrochemical polymerization and deposition on carbon fibers N80-20396

POLYSTYRENE
Thermal decomposition and combustion studies on potassium perchlorate/polystyrene propellant systems
[LOG-J11458] N80-20403

POPULATION THEORY
Perspective on world energy
[DOE/TIC-10273] N80-20898

POPULATIONS
A global biogeocenotical biosphere simulation
[NASA-TM-76042] N80-20920

PORTABLE EQUIPMENT
Portable heatable container
[NASA-CASE-NPO-14237-1] N80-20808

POSITION (LOCATION)
SFB 78/IFAG projects for laser measurement of distances to satellites N80-20642
Contributions of the SFB 78/IFAG to Doppler measurements for satellite positioning N80-20643
Locational characteristics and the sequence of computer assisted processes of cartographic generalization N80-20685
Sources of variations in LANDSAT autocorrelation --- Richmond, Virginia and Denver, Colorado
N80-20767

POSITRON ANNIHILATION
Comparison of jet size in anti-neutrino proton interactions with that in positron electron annihilation
[ANL-HEP-PR-79-17] N80-21117

POSITRONS
Comparison of jet size in anti-neutrino proton interactions with that in positron electron annihilation
[ANL-HEP-PR-79-17] N80-21117

POTABLE WATER
Water resources in arid and semiarid regions. A bibliography with abstracts
[PB80-802259] N80-20795

POTASSIUM PERCHLORATES
Thermal decomposition and combustion studies on potassium perchlorate/polystyrene propellant systems
[LOG-J11458] N80-20403

POTENTIAL ENERGY
Magnetic field modeling and crustal studies
N80-20726
Transport properties in the atmosphere of Jupiter
[NASA-CR-162897] N80-21234

POTENTIAL FLOW
A calculating technique for the flow field around a hydraulic turbine --- panel method
[ILR-37] N80-20553

POTENTIAL THEORY
The Boltzmann equation with a soft potential. Part 1: Linear, spatially-homogeneous
[AD-A079706] N80-21068

POWER CONDITIONING
Measurement techniques for high power semiconductor materials and devices
[DOE/RA-0041] N80-20506

POWER EFFICIENCY
Effect of water injection and off scheduling of variable inlet guide vanes, gas generator speed and power turbine nozzle angle on the performance of an automotive gas turbine engine
[NASA-TM-81415] N80-20272
Pocket nickel cadmium cell and battery evaluation
N80-20851

POWER SUPPLY CIRCUITS
The application of DC-DC energy conversion in a solar energy system
[AD-A077112] N80-20867

PRECIPITATION (METEOROLOGY)
Precipitation and accumulation estimates for East Antarctica, derived from rawinsonde information
N80-20956
GATE radar rainfall atlas
[PB80-121130] N80-21003

PRECISION
On precision in the gathering and production of cartographic data N80-20657

PREDICTION ANALYSIS TECHNIQUES
The development of rapid predictive methods for three-dimensional transonic flow fields about fighter bomber aircraft, part 1
[AD-A078683] N80-20236

PRESSURE MEASUREMENTS
Detection of the transitional layer between laminar and turbulent flow areas on a wing surface --- using an accelerometer to measure pressure levels during wind tunnel tests
[NASA-CASE-LAR-12261-1] N80-20224
The pressuremeter: Application of pavement design --- airport runways N80-20432

PRESSURE VESSELS
Development of automated welding processes for field fabrication of thick-walled pressure vessels: Electron beam method
[FE-2606-T1] N80-20597
Acoustic emission: Who needs it and why? --- pressure vessel reliability
[HEDL-SA-1808-FP] N80-20605
Acoustic emission monitoring of steel and concrete structural elements with particular reference to primary nuclear containment structures
[CONF-790966-1] N80-21105

PRESSURIZED WATER REACTORS
Two-phase jet loads
[SAND-79-1963C] N80-20552

PRIORITIES
Priority R and D needs of urban America, resource document
[PB80-106164] N80-21215

PROBABILITY DISTRIBUTION FUNCTIONS
Local asymptotic normality for progressively censored likelihood ratio statistics and applications
[AD-A077005] N80-21088
On the candidate date problem with a random number of candidates
[AD-A075577] N80-21092

PROBABILITY THEORY
Probabilistic method for grouping data
[ORNL/CSD/TM-65] N80-21095

PROBLEM SOLVING
Differential geometric methods for solving nonlinear constrained optimization problems and a related system of nonlinear equations: Global analysis and implementation
[BNL-26729] N80-21079
Lectures on the practical solution of differential equations
[ORNL/TM-6920] N80-21082

PROCESS CONTROL (INDUSTRY)
Development of combustion data to utilize low-Btu gases as industrial process fuels, project 61004. Special report no. 7: Premix tunnel burner
[FE-2489-41] N80-20418
Internal quality of aluminum die castings
N80-20601

PROCESSES
Development of combustion data to utilize low-Btu gases as industrial process fuels, project 61004. Special report no. 7: Premix tunnel burner
[FE-2489-41] N80-20418

PRODUCT DEVELOPMENT
Galileo lithium/SO2 N80-20827
Battery reconditioning, summary of TRW experience N80-20847
Design and fabrication of prototype combined photovoltaic/thermal non-tracking collector
[SAND-79-7014] N80-20899
Low cost thin film polycrystalline silicon solar cells
[DOE/ET-23048/1] N80-20906

PRODUCTION ENGINEERING
Production of aluminum-silicon alloy and ferrosilicon and commercial purity aluminum by the direct reduction process, phase B
[CONS/5089-7] N80-20382
Coal liquefaction with synthesis gas
[PETC/TR-79/1] N80-20416
Trace and minor element analyses of coal liquefaction products
[PETC/TR-79/3] N80-20417
Analysis and evaluation in the production process and equipment area of the low-cost solar array project
[NASA-CR-162904] N80-20814
Large area silicon sheet by EFG
[NASA-CR-162907] N80-20816
Phase 2: Array automated assembly task low cost silicon solar array project
[NASA-CR-162912] N80-20817

PROJECT PLANNING
Planning and control of research and development projects with contributions from space technology
N80-21185
Study and implementation of an ESA computerized planning system, phase 2. Volume 4: Updating of Subprograms ESA 1-5
[GTS-760972-VOL-4] N80-21187
Study and implementation of an ESA computerized planning system, phase 2. Volume 5: Project returns and benefits
[GTS-760972-VOL-5] N80-21188
Study and implementation of an ESA computerized planning system. Executive summary
[GTS-760972-VOL-6] N80-21189

PROJECTIVE GEOMETRY
Map projection change: Some programs for the transformation of the contents of available maps according to different map projections N80-20690

PROPELLANT COMBUSTION
Experimental and analytical study of erosive burning of solid propellants
[AD-A079618] N80-20409

PROPELLANT DECOMPOSITION
Thermal decomposition and combustion studies on potassium perchlorate/polystyrene propellant systems
[LOG-J11458] N80-20403

PROPELLANT STORAGE
TNT equivalency of benite propellant --- to determine overpressure for propellant storage
[AD-A077108] N80-20406

PROPELLANT TESTS
Solar rocket system concept analysis
[AD-A079117] N80-20308
TNT equivalency of benite propellant --- to determine overpressure for propellant storage
[AD-A077108] N80-20406

PROPELLANTS
TNT equivalency of benite propellant --- to determine overpressure for propellant storage
[AD-A077108] N80-20406

PROPELLER DRIVE
Feasibility study of an isolated reverse-turbine system for gas turbine engines --- marine propulsion
[AD-A077898] N80-20276

PROPHYLAXIS
Prophylaxis and treatment of seasickness
[NASA-TM-76108] N80-21024

PROPULSION SYSTEM CONFIGURATIONS
Solar rocket system concept analysis
[AD-A079117] N80-20308
Fuel economy screening study of advanced automotive gas turbine engines
[NASA-TM-81433] N80-21201
Energy storage systems for automobile propulsion
[UCID-18320] N80-21211

PROPULSION SYSTEM PERFORMANCE
JT9D-7A (SP) jet engine performance deterioration trends
[NASA-TM-81459] N80-20274
PROPULSIVE EFFICIENCY
Technology requirements and readiness for very large aircraft
[NASA-TM-81783] N80-20223
PROTECTION
PLASTIC CANOPY: A computer program for the structural analysis of protective canopies
[PB80-122724] N80-20798
PROTECTIVE COATINGS
Testing the corrosion protection properties of coatings by means of pulsed direct current
[BLL-RTS-11872] N80-20366
PROTONS
Kaon-proton backward elastic scattering between 476 and 1084 MeV/c
[LBL-8969] N80-21120
PUBLIC HEALTH
Coal-conversion technologies: Some health and environmental effects
[BNL-5103] N80-20930
Model for measuring the health impact from changing levels of ambient air pollution: Morbidity study
[PB80-107030] N80-21027
PULSE CODE MODULATION
Speech bandwidth reduction
[PB80-103955] N80-20479
PULSE COMMUNICATION
Memory-based frame synchronizer --- for voice data processing in digital communication systems
[NASA-CASE-GSC-12430-1] N80-20453
Tropospheric scatter communications. A bibliography with abstracts
[NTIS/PS-79/0750/4] N80-20478
Some aspects of block quantization with applications to source coding and digital holography N80-20562
PULSE DURATION MODULATION
Pulse-width-modulated amplifier drives for machine tools
[Y/DX-02] N80-20598
PULSED LASERS
Laser-Raman measurements in a ducted, two-stream, subsonic, H2/air combustion flow
[AD-A078112] N80-20233
Holographic interferometric survey of boundary layer transition in an axisymmetric free convection thermal boundary layer
[AD-A079880] N80-20567
Beamed energy coupling studies
[AD-A080037] N80-20578
Selection of a ruby laser for use as an illuminating laser for the BMK75 or as a reflecting laser for SRS N80-20693
PULSED RADIATION
High power ion-irradiation test for CTR first wall --- using a plasma anode
[IPPJ-437] N80-21158
PUMPS
Solar water pumps. Citations from the Engineering Index data base
[PB80-802531] N80-20910
PURIFICATION
Chemistry research and development --- americium and plutonium recovery and purification
[RFP-2952] N80-20309
PYRANOMETERS
Satellite calibration data, annual data report
[AD-A075602] N80-20301
PYROLYSIS
Thermal reactor and process --- liquid silicon production from silane
[NASA-CASE-NPO-14369-1] N80-20338
Thermal decomposition and combustion studies on potassium perchlorate/polystyrene propellant systems
[LOG-J11458] N80-20403

Q

QUADRATIC EQUATIONS
Numerical methods for stiff nonlinear and quadratic differential equations
[AD-A079303] N80-21077
QUADRATIC PROGRAMMING
Rotor model parameters estimation and rotor balancing studies with quadratic programming N80-20587
QUADRATURES
Practical aspects of Gaussian integration
[AD-A079030] N80-21076
QUADRUPOLES
Selected ion fragmentation with a triple quadrupole mass spectrometer N80-20337
QUALITY CONTROL
Development of combustion data to utilize low-Btu gases as industrial process fuels, project 61004. Special report no. 7: Premix tunnel burner
[FE-2489-41] N80-20418
Internal quality of aluminum die castings N80-20601
Qualification test procedures and results for Honeywell solar collector subsystem, single-family residence
[NASA-CR-161382] N80-20813
Noise measurements and quality assurance
[PB80-107246] N80-21106
QUANTITATIVE ANALYSIS
X-ray diffraction analysis of selected paint pigments --- traffic paints
[PB80-113061] N80-20401
Frame C: A compact procedure for quantitative energy-dispersive electron probe X-ray analysis
[PB80-110307] N80-20570
QUENCHING (COOLING)
Thermo-elastic-plastic stresses in hollow cylinders due to quenching
[AD-A077109] N80-20622
QUEUEING THEORY
Simulating generalized semi-Markov processes
[AD-A075549] N80-21089

R

RADAR
Multiband Klystron study
[AD-A078036] N80-20490
RADAR ANTENNAS
Millstone Hill Radio Star Calibration
[AD-A079037] N80-20475
RADAR CLUTTER MAPS
Characterization of nonstationary clutter
[AD-A079655] N80-20460
RADAR DATA
Characterization of nonstationary clutter
[AD-A079655] N80-20460
RADAR EQUIPMENT
A standardization evaluation potential study of the common multi-mode radar program
[AD-A079678] N80-20459
Collision avoidance radar braking systems investigation, phase 3 study
[PB80-108939] N80-21218
RADAR IMAGERY
Image understanding research
[AD-A078034] N80-20454
Basic research in three-dimensional imaging from transient radar scattering signatures
[AD-A079423] N80-20462
RADAR MEASUREMENT
Remote sensing of ocean surface current and current shear by HF backscatter radar N80-20718
RADAR SIGNATURES
Near-millimeter wave technology base study. Volume 1: Propagation and target/background characteristics
[AD-A079620] N80-20461
RADAR TARGETS
Basic research in three-dimensional imaging from transient radar scattering signatures
[AD-A079423] N80-20462
RADAR TRACKING
Sources of tracking error in millimeter wavelength missile guidance systems
[AD-A078226] N80-20298
Multienvironment active RF seeker test and evaluation program, MARFS test
[AD-A078161] N80-20455
An initial assessment of the performance achieved by the Seasat-1 radar altimeter
[NASA-TM-73279] N80-20564
RADIANCE
Improvement in classification accuracy of LANDSAT MSS data in areas of mountainous terrain N80-20766
Sources of variations in LANDSAT autocorrelation --- Richmond, Virginia and Denver, Colorado N80-20767
Off-nadir viewing effects on spectral assessment of green biomass N80-20772
Radiometric resolution for monitoring vegetation: How many bits are needed? N80-20777
A spectral method for determining the percentage of green herbage material in clipped samples N80-20780
An improved model for the calculation of longwave flux at 11 micrometers --- satellite radiance measurements
[PB80-119431] N80-20981
RADIANT FLUX DENSITY
Simulation study of a geometric shape factor technique for estimating earth-emitted radiant flux densities from wide-field-of-view radiation measurements
[NASA-TP-1629] N80-20986
RADIATION COUNTERS
Spacecraft test chamber contamination study in the AEDC Mark 1 facility
[AD-A079638] N80-20290
Method and means for helium/hydrogen ratio measurement by alpha scattering
[NASA-CASE-NPO-14079-1] N80-20334
Beta gauge operation manual
[PB80-112337] N80-20937
RADIATION DAMAGE
Time resolved spectroscopy using synchrotron radiation
[LBL-9475] N80-20354
RADIATION DETECTORS
Multispectral linear array sensor development N80-20783
RADIATION EFFECTS
Theoretical and experimental study of the proximity effects of thin-wire antenna in pressure of biological bodies --- electromagnetic radiation effects N80-20451
Absorption characteristics of prolate spheroidal model of man and animals at and near resonance frequency
[PB80-108293] N80-21028
RADIATION MEASUREMENT
Survey of instrumentation for environmental monitoring: Major update. Volume 3: Radiation
[LBL-1-VOL-3] N80-20925
Application of germanium detectors to environmental monitoring
[PB80-113624] N80-20936
Simulation study of a geometric shape factor technique for estimating earth-emitted radiant flux densities from wide-field-of-view radiation measurements
[NASA-TP-1629] N80-20986
RADIATION MEASURING INSTRUMENTS
American National Standard N538-1979 classification of industrial ionizing radiation gauging devices --- safety aspects
[PB80-11012] N80-20569
RADIATIVE HEAT TRANSFER
Two-dimensional, laminar, mixed (forced and free) convection, radiative diffusion flames N80-20333
RADIATIVE TRANSFER
Adaptation and optimization of a line-by-line radiative transfer program for the STAR-100 (STARSMART)
[NASA-CR-159238] N80-21044
RADIO ALTIMETERS
An initial assessment of the performance achieved by the Seasat-1 radar altimeter
[NASA-TM-73279] N80-20564
RADIO BEACONS
Standard engineering installation package, nondirectional beacon
[AD-A078204] N80-20253
RADIO COMMUNICATION
Digital-phase method of forming single sideband signals --- application to radio communication
[BLL-RTS-11857] N80-20449
A model of natural HF radio noise in severely disturbed propagation environments
[AD-A077619] N80-20474

RADIO FREQUENCIES
Multienvironment active RF seeker test and evaluation program, MARFS test
[AD-A078161] N80-20455

RADIO METEOROLOGY
Day-night differences in radiosonde observations of the stratosphere and troposphere
[PB80-117989] N80-20995

RADIO NAVIGATION
Combined pseudo range and Doppler positioning for the stationary NAVSTAR user
[AD-A079543] N80-20256
NAVSTAR GPS civil applications study
[AD-A078277] N80-20257

RADIO RECEIVERS
Simulation of a navigator algorithm for a low-cost GPS receiver
[NASA-TM-81778] N80-20251

RADIOACTIVE CONTAMINANTS
Decontamination of metals containing plutonium and americium
[ANL-78-13] N80-20599

RADIOACTIVE DECAY
Environmental development plan for space applications --- development of nuclear power supplies for use in space
[DOE/EDP-0057] N80-20922

RADIOACTIVE WASTES
Remote experimental facility to solidify SRP high-level waste
[DP-MS-79-53] N80-21128
Nevada nuclear waste storage investigations
[NVO-196-11] N80-21129
Research and development activities: High-Level Waste Immobilization Program
[PNL-2999-PT-1] N80-21130
Waste isolation safety assessment program. A brief description of the three-dimensional finite element ground-water flow model adapted for waste isolation safety assessments
[PNL-2652] N80-21131
Sensitivity on the parameters of the regional hydrology model for the Nevada nuclear waste storage investigations
[SAND-79-1197C] N80-21132
Operational Radioactive Waste Management Plan for the Nevada test site
[NVO-185-REV-1] N80-21134
Temperatures generated by underground storage of defense waste canisters
[DP-MS-79-37] N80-21135

RADIOBIOLOGY
Fifth Working Conference (Space Biology) at the 21st Plenary Session of COSPAR
[NASA-TM-76107] N80-21017

RADIOGRAPHY
Status of radiographic study, development, and new applications in the LASL Nondestructive Testing Group
[LA-UR-79-2648] N80-20606

RADIOISOTOPE BATTERIES
Heat pipes: Properties of common small-pore wicks
[ESDU-79013] N80-20512

RADIOMETERS
Linear array pushbroom radiometer data analysis
N80-20784
Simulation study of a geometric shape factor technique for estimating earth-emitted radiant flux densities from wide-field-of-view radiation measurements
[NASA-TP-1629] N80-20986

RADIOSONDES
Day-night differences in radiosonde observations of the stratosphere and troposphere
[PB80-117989] N80-20995

RAIL TRANSPORTATION
Airport ground access
[AD-A068974] N80-20284

RAIN
Determination of selected anions in water by ion chromatography
[PB80-111941] N80-20356
The economic effects of weather modification activities. Part 2: Range production and interindustry analysis
[PB80-112055] N80-21006

RAINSTORMS
Hydrometeorological characteristics of severe rainstorms in Illinois
[PB80-110406] N80-20997

RAMAN SPECTRA
Application of Raman diagnostics to combustion
[NASA-CR-162901] N80-20339
Generation of 16 micron radiation using stimulated rotational Raman scattering in hydrogen --- using a CO2 TEA laser N80-20573
Study of Raman linewidths as a function of structure, bonding and temperature N80-21171

RAMAN SPECTROSCOPY
Laser-Raman measurements in a ducted, two-stream, subsonic, H2/air combustion flow
[AD-A078112] N80-20233

RAMJET ENGINES
Thermodynamics of organic compounds --- ramjet fuels
[AD-A080072] N80-20410

RANDOM NOISE
Analysis of first and second order binary quantized digital phase-locked loops for ideal and white Gaussian noise inputs
[NASA-CR-162841] N80-20250
On the scale of fluctuation of random functions
[PB80-107865] N80-21084

RANDOM PROCESSES
On the scale of fluctuation of random functions
[PB80-107865] N80-21084

RANDOM SIGNALS
Random signal flaw detection
[AD-A078443] N80-21103

RANDOM VARIABLES
On the candidate date problem with a random number of candidates
[AD-A075577] N80-21092

RANDOM VIBRATION
Bias errors in a random vibration extremal control strategy
[SAND-79-1222] N80-20632

RANGE ERRORS
Error analysis for a spaceborne laser ranging system
[NASA-CR-162887] N80-20575

RANGELANDS
A spectral method for determining the percentage of green herbage material in clipped samples
N80-20780
Evaluation of a spectral method for percentage green determination using clipped rangeland forage samples --- Texas N80-20781
The economic effects of weather modification activities. Part 2: Range production and interindustry analysis
[PB80-112055] N80-21006

RARE GASES
Study of the interactions of rare gas molecules by measuring total and differential transverse scattering
[MPIS-15/1978] N80-21123

RAREFIED GAS DYNAMICS
Determination of forces on arbitrary concave bodies in high speed rarefied gases
[LOG-J11513] N80-20530

RAWINSONDES
Precipitation and accumulation estimates for East Antarctica, derived from rawinsonde information
N80-20956

RAYLEIGH WAVES
Preliminary report of numerical simulation of intermediate wavelength collisional Rayleigh-Taylor instability in equatorial spread F
[AD-A079307] N80-20969

RCA COMPUTERS
MIL-M-38510/470 test vectors: Fault detection efficiency measurement via hardware fault simulation --- rca 1802 microprocessor
[NASA-CR-162916] N80-21037

REACTION KINETICS
Theoretical and computational approach to modeling flame ignition
[AD-A079306] N80-20347
Chemical kinetic modeling for combustion applications
[UCRL-81777] N80-20353
Kinetics and machanisms of catalytic hydroliquefaction and hydrogasification of lignite
[FE-2702-7] N80-20421
Reversal of nickel cadmium cells --- chemical reactions N80-20649
Structure reactivity correlations for environmental reactions
[PB80-110323] N80-20934

REACTOR DESIGN
Design of photochemical reaction chamber --- to study exhaust gases from coal fired power plants
[PB80-100654] N80-20360
Advanced development of a short-residence-time hydrogasifier
[FE-3125-5] N80-20414
Selection of power plant elements for future reactor space electric power systems
[LA-7858] N80-21133
Material implications of design and system studies for inertial confinement fusion systems
[UCRL-82041] N80-21163

REACTOR MATERIALS
Development, testing and evaluation of MHD materials and components designs
[FE-2248-22] N80-21180
Material implications of design and system studies for inertial confinement fusion systems
[UCRL-82041] N80-21163

REACTOR SAFETY
Two-phase jet loads
[SAND-79-1963C] N80-20552

REACTOR TECHNOLOGY
Two-phase jet loads
[SAND-79-1963C] N80-20552

REAL GASES
Real-gas effects on the aerodynamics of blunt cones as measured in a hypervelocity range
[AD-A075526] N80-20241

REAL TIME OPERATION
Real-time data reduction capabilities at the Langley 7 by 10 foot high speed tunnel
[NASA-TM-78601] N80-20286
Workshop on Real-Time Programming for NASA Flight Project
[NASA-TM-80236] N80-21045

RECEIVERS
Transient response of a heterodyne receiver: Implications for a time-of-arrival system
[AD-A078373] N80-20469
GaAs analog integrated circuits (GaAs RF-LSI), volume 1 --- microwave receivers
[AD-A079588] N80-20497
On the physical realizability of broadband lumped-parameter equivalent circuits for energy-collecting structures
[AD-A079962] N80-20499

RECONNAISSANCE
Passive infrared surveillance. Part 1: Model formulation
[AD-A075603] N80-21145

RECOVERY PARACHUTES
A spin-recovery parachute system for light general-aviation airplanes
[NASA-TM-80237] N80-20227

RECTANGULAR PANELS
On the load displacement relation for a cracked rectangular specimen with constrained ends
[AD-A075527] N80-20624

RECTANGULAR PLATES
Effect of imperfections on the collapse of rectangular plates using variational calculus
[AD-A079905] N80-20627

RECURSIVE FUNCTIONS
A recursive Lagrangian formulation of manipulator dynamics and a comparative study of dynamics formulation complexity
[AD-A078067] N80-21062

RECYCLING
Pavement recycling-bituminous concrete and concrete mix designs
[PB80-106263] N80-20443

REDUCED GRAVITY
LeRC reduced gravity fluid management technology program
[NASA-TM-81450] N80-20304

REDUCTION (CHEMISTRY)
Production of aluminum-silicon alloy and ferrosilicon and commercial purity aluminum by the direct reduction process, phase II
[CONS/5089-7] N80-20382

REFINING
Refining and upgrading of synfuels from coal and oil shales by advanced catalytic processes
[FE-2315-37] N80-20407

REFLECTANCE
Satellite calibration data: annual data report
[AD-A075602] N80-20301
On the verification of satellite reflectance measurements N80-20694
Extending the Neodymium-YAG laser reflectance measuring system to lunar measurements at the Wetzell station N80-20695
REFLECTION
On spectral signatures in central perspective representation N80-20665
REFRACTORIES
Molybdenum: Mineral commodity profiles
[PB80-110985] N80-20392
REFRACTORY MATERIALS
Study program to develop and evaluate die and container materials for the growth of silicon ribbons — for development of low cost solar cells
[NASA-CR-162899] N80-20816
REGIONAL PLANNING
Determining the feasibility of incorporating water resource constraints into energy models
[EPRI-EA-1147] N80-20908
REGRESSION ANALYSIS
Statistical investigation of pavement skid resistance data
[PB80-116114] N80-20446
Probabilistic method for grouping data
[ORNL/CSD/TM-65] N80-21095
REINFORCED SHELLS
An investigation of rib stiffened hyperbolic cooling tower under statical loads using discrete field and Galerkin finite element methods N80-20617
REINFORCEMENT (STRUCTURES)
Use of Glass Reinforced Concrete (GRCD) as a substrate for photovoltaic modules
[NASA-CR-162898] N80-20819
RELATIVISTIC THEORY
Unified gauge theories in nuclear physics N80-21127
RELATIVITY
Accelerating particles in general relativity (stationary C-metric) N80-21164
RELAXATION METHOD (MATHEMATICS)
Shape segmentation using relaxation
[AD-A078084] N80-21060
RELAY SATELLITES
Satellite personal communications system
[NASA-CASE-NPO-14480-1] N80-20448
RELIABILITY
Common cause failure analysis techniques: A review and comparative evaluation
[TREE-1349] N80-20603
RELIABILITY ANALYSIS
Bounding the reliability of multistate systems
[AD-A075579] N80-20602
RELIEF MAPS
Computer based generalization for the elaboration and extension of topographic maps N80-20658
The topographic synoptic map 1:200,000 N80-20661
The synoptic map 1:500,000 (World, Series 1404) N80-20662
Orthophoto techniques and photomaps N80-20666
On the displacement problem as part of a process in generalizing topographical maps. Proposition for hierarchial order and the search for EDP assisted solutions N80-20675
REMOTE REGIONS
Market definition study of photovoltaic power for remote villages in the United States
[NASA-CR-159600] N80-20812
REMOTE SENSORS
An initial assessment of the performance achieved by the Seasat-1 radar altimeter
[NASA-TM-73279] N80-20564
Obtaining surface information for topography and town and country planning from remote sensing N80-20666
Reports on cartography and topographical measurements. Series 1: Original reports
[REPT-77] N80-20705
Contributions to the creation of a conclusive system of concepts of photogrammetry and aerial photograph cartography N80-20706
Report of the IGP Working Group 7-9 'Spectral Signatures of Objects' N80-20713
Earth resources. A continuing bibliography with indexes, issue 24
[NASA-SP-7041(24)] N80-20717
Multispectral linear array sensor development N80-20783
Microwave remote sensing technology for the marine oil pollution surveillance
[REPT-202] N80-20786
Interactive digital satellite image processing system for oceanographic applications
[AD-A079697] N80-20790
Computer processing of multispectral scanner data over coal strip mines
[PB80-111677] N80-20803
Remote sensing applied to pollution monitoring. Citations from the International Aerospace Abstracts data base
[NTIS/PS-79/0732/2] N80-20952
An improved model for the calculation of longwave flux at 11 micrometers — satellite radiance measurements
[PB80-119431] N80-20981
RENE 95
An evaluation of four current models to predict the creep-fatigue interaction in rene 95
[AD-A077168] N80-20623
REPEATERS
Sampling digital multiple channel same frequency repeater study
[AD-A078817] N80-20472
RESEARCH AIRCRAFT
Airflow effects on riming measurements by a wing tip-mounted ice detector on the MC130E research airplane
[AD-A077019] N80-20244
RESEARCH AND DEVELOPMENT
Research and development activities: High-Level Waste Immobilization Program
[PNL-2999-PT-1] N80-21130
Priority R and D needs of urban America, resource document
[PB80-106164] N80-21215
RESEARCH MANAGEMENT
The 25 years at the Institute for Applied Geodesy N80-20639
Planning and control of research and development projects with contributions from space technology N80-21185
RESERVOIRS
Geodetic stability of the Green Bank, West Virginia VLBI site N80-20742
RESIDENTIAL AREAS
Geothermal energy market penetration: Development of a model for the residential section
[PB80-118359] N80-21198
RESIDUAL STRESS
Calculation of residual principal stresses in CVD boron on carbon filaments
[NASA-TM-81456] N80-20314
RESISTORS
Microstructural studies of thick film resistors using transmission electron microscopy
[SAND-79-0367C] N80-20506
RESONATORS
Combustion of methanol coal slurries in Hartmann resonator
[FE-2744-T2] N80-20351
RESOURCES MANAGEMENT
Technical options for conservation of metals: Case studies of selected metals and products
[PB80-102619] N80-20393
LANDSAT-D assessment system N80-20782
Analysis of current trends in U.S. petroleum and natural gas production
[PB80-116056] N80-20800
Perspective on world energy
[DOE/TIC-10273] N80-20898
Determining the feasibility of incorporating water resource constraints into energy models
[EPRI-EA-1147] N80-20908
A global biogeocenotical biosphere simulation
[NASA-TM-78042] N80-20920
RESPIRATION
Development of a biological simulation monitor for joint municipal/industrial treatment systems
[PB80-111032] N80-20951
RETROREFLECTION
Method and apparatus for Doppler frequency modulation of radiation
[NASA-CASE-NPO-14524-1] N80-21141
REVERSED FLOW
Feasibility study of an isolated reverse-turbine system for gas turbine engines — marine propulsion
[AD-A077898] N80-20276
RHEOLOGY
Surface temperatures and glassy state investigations in tribology, part 3 — limiting shear stress rheological model
[NASA-CR-3272] N80-20589
RHODIUM COMPOUNDS
Roles of crystal fields in magnetic superconducting rare-earth rhodium borides
[LA-UR-79-3174] N80-21175
RIBBONS
Large area silicon sheet by EFG
[NASA-CR-162907] N80-20816
RIDING QUALITY
Human comfort response to dominant random motions in longitudinal modes of aircraft motion
[NASA-CR-159186] N80-21030
Human comfort response to random motions with a dominant pitching motion
[NASA-CR-159140] N80-21034
RIGID STRUCTURES
Seismic design of reinforced concrete buildings: An inelastic response spectrum approach — earthquake resistant structures beams (supports) N80-20433
Dynamic buckling of a rigid-plastic cylindrical shell: A second order differential equation subject to four boundary conditions
[CDO-4122-29] N80-20636
ROCKET ENGINE DESIGN
Technology requirements for future Earth-to-geosynchronous orbit transportation systems. Volume 3: Appendices
[NASA-CR-159174] N80-20303
ROCKET LAUNCHING
The 19304D GSRS, missile number 1046, round number V-66, 23 August 1979
[AD-A079989] N80-20986
ROCKETS
Solar rocket system concept analysis
[AD-A079117] N80-20308
ROCKS
Regional Modeling: The Kentucky anomaly N80-20730
ROLL FORMING
Damping of anisotropic composites studied from the properties of the rolled components
[ILR-41] N80-20324
ROLLER BEARINGS
Lubrication of rolling-element bearings
[NASA-TM-81449] N80-20591
ROTARY WINGS
On the nonlinear deformation geometry of Euler-Bernoulli beams — rotary wings
[NASA-TP-1566] N80-20619
ROTATING BODIES
On the nonlinear deformation geometry of Euler-Bernoulli beams — rotary wings
[NASA-TP-1566] N80-20619
ROTATING CYLINDERS
Dynamics of flexible rotors partially filled with a viscous incompressible fluid N80-20513
Nongeostrophic baroclinic instability of two fluids — stability analysis of fluid in a rotating cylinder N80-20517
ROTATING FLUIDS
Dynamics of flexible rotors partially filled with a viscous incompressible fluid N80-20513
Nongeostrophic baroclinic instability of two fluids — stability analysis of fluid in a rotating cylinder N80-20517
ROTORS
Dynamics of flexible rotors partially filled with a viscous incompressible fluid N80-20513
Rotor model parameters estimation and rotor balancing studies with quadratic programming N80-20587
RUBY LASERS
Selection of a ruby laser for use as an illuminating laser for the BMK75 or as a reflecting laser for SRS N80-20693
RUMANIA
Geophysical atlas N80-20734
RUNWAYS
Airfield pavement evaluation, volume 4. A bibliography with abstracts
[NTIS/PS-79/0754/6] N80-20288

The pressuremeter: Application of pavement design — airport runways N80-20402

S

SAFETY
AMTV headway sensor and safety design
[NASA-CR-162717] N80-21200
SAFETY FACTORS
American National Standard N538-1970 classification of industrial ionizing radiation gauging devices — safety aspects
[PB80-11012] N80-20969
SAFETY MANAGEMENT
Operational Radioactive Waste Management Plan for the Nevada test site
[NVO-185-REV-1] N80-21134
SAGE SATELLITE
Discussion of the SAGE anomaly N80-20839
SAHARA DESERT (AFRICA)
Application of LANDSAT imagery to monitor sand dunes movement in the Sahara Desert N80-20719
SAMPLERS
Prototype particulate stack samplers with single-cut nozzle and microcomputer calculating/display system
[LA-UR-79-2421] N80-20920
SAN ANDREAS FAULT
Plate boundary deformation in California — Southern California: Elsinore, Earthquake Valley, and San Felipe Faults N80-20739
On the slection of station sites for observing strain streps and earthquake forerunners in California N80-20740
SAN ANDREAS FAULT EXPERIMENT
Earth Survey Applications Division: Research leading to the effective use of space technology in applications relating to the Earth's surface and interior
[E80-10094] N80-20722
Earth survey applications division: Research leading to the effective use of space technology in applications relating to the Earth's surface and interior
[E80-10097] N80-20723
Crustal deformation: Crustal dynamics project N80-20738
Crustal motion measurements in California (SAFE) N80-20746
SATELLITE ATMOSPHERES
Outer satellite atmospheres: Their extended nature and planetary interactions — sodium cloud of Io, hydrogen torus of Titan, and comet atmospheres
[NASA-CR-162902] N80-21235
SATELLITE DRAG
Unexplained Lageos perturbation N80-20751
SATELLITE GROUND TRACKS
The SEASAT altimeter height bias using four Bermuda overflights N80-20758
The spaceborne laser ranging system N80-20785
SATELLITE NAVIGATION SYSTEMS
NAVPAC: A space-qualified navigation package
[AD-A077082] N80-20294
SATELLITE OBSERVATION
Satellite calibration data, annual data report
[AD-A079802] N80-20301
Estimating nocturnal surface temperature in Florida using thermal data from geostationary satellite data N80-20982
Satellite activities of NOAA 1978 — geostationary and polar orbiting systems
[PB80-112792] N80-21002
SATELLITE ORBITS
Orbital estimation using two-body classical orbital elements as measurement updates
[AD-A079903] N80-20290
Stabilizing an unstable orbit about L3 in the Sun, Earth, Moon system using linear constant gain feedback
[AD-A079860] N80-20292
Effect of linear approximation for satellite Doppler frequency in geodetic positioning
[AD-A079128] N80-20299
Motion of artificial Earth satellites in related orbits N80-20703
Study for a project for a European high precision laser network N80-20704
Geodyn program systems development N80-20747
SATELLITE PERTURBATION
Unexplained Lageos perturbation N80-20751
SATELLITE TRACKING
NAVPAC: A space-qualified navigation package
[AD-A077082] N80-20294
Effect of linear approximation for satellite Doppler frequency in geodetic positioning
[AD-A079128] N80-20299
Improved tables of coordinates allotted to the Wettzell satellite tracking station N80-20692
On the verification of satellite reflectance measurements N80-20694
SATELLITE-BORNE INSTRUMENTS
NAVPAC: A space-qualified navigation package
[AD-A077082] N80-20294
Error analysis for a spaceborne laser ranging system
[NASA-CR-162887] N80-20575
SATELLITE-BORNE PHOTOGRAPHY
Possibilities of application of LANDSAT and Skylab data to small scale cartography N80-20710
Assessment of satellite and aircraft multispectral scanner data for strip-mine monitoring
[NASA-TM-79368] N80-20787
SATELLITE-BORNE RADAR
Contributions to the utilization of altimeter data N80-20644
SCALE (RATIO)
The synoptic map 1:500,000 (World, Series 1404) N80-20662
The international world map 1:1,000,000 (IWK) N80-20663
A program for the fully automated displacement of point and line features in cartographic generalization N80-20680
SCATHA SATELLITE
AFSIM, an Air Force satellite interactions model
[AD-A079032] N80-20300
SCATTERING
Study of the interactions of rare gas molecules by measuring total and differential transverse scattering
[WPIS-15/1978] N80-21123
Molecular beam photoionization and gas-surface scattering
[LBL-9838] N80-21177
SCATTERING CROSS SECTIONS
Method and means for helium/hydrogen ratio measurement by alpha scattering
[NASA-CASE-NPO-14079-1] N80-20334
SCENE ANALYSIS
NASA-census Application Pilot Test (APT) and urban area delineation studies — Seattle, Washington; Austin, Texas; Orlando, Florida; Boston, Massachusetts, and Richmond, Virginia N80-20765
SCRUBBERS
Development of superior entrainment separators
[PB80-112394] N80-20938
Development of droplet sizing for the scrubbing systems
[PB80-108574] N80-20954
SEA ICE
Observations of position, ocean depth, ice rotation, magnetic declination and gravity taken at the FRAM 1 drifting ice station
[AD-A077083] N80-20966
SEA ROUGHNESS
Prophylaxis and treatment of seasickness
[NASA-TM-76108] N80-21024
SEA STATES
The effect of sea state on altimeter measurements N80-20759
Mean sea surface computation using GEOS-3 altimeter data N80-20760
Equatorial Pacific Ocean variability-seasonal and El Nino time scales N80-21007
SEALS (STOPPERS)
Lift analysis on the bow seal of the surface effect ship testcraft XR-3
[AD-A078907] N80-20439
SEASAT SATELLITES
An initial assessment of the performance achieved by the Seasat-1 radar altimeter
[NASA-TM-73279] N80-20564
Gravity model improvement for SEASAT N80-20749
SEASAT-A SATELLITE
The SEASAT altimeter height bias using four Bermuda overflights N80-20758
SECONDARY EMISSION
Secondary electron radiation
[UCRL-TRANS-11465] N80-21112
SECULAR VARIATIONS
Spherical harmonic models of the core field N80-20727
SEISMIC ENERGY
On the slection of station sites for observing strain streps and earthquake forerunners in California N80-20740
Earthquake and crustal deformation studies — San Francisco and Fort Ross, California N80-20743
SEISMIC WAVES
GSFC site stability N80-20741
Geodetic stability of the Green Bank, West Virginia VLBI site N80-20742
SEISMOGRAMS
Finite-difference synthetic seismograms for kinematic models of the earthquake source N80-20960
A non-Gaussian stochastic model applied to deconvolution and seismogram inversion N80-20961
SEISMOGRAPHS
Development of A seismic data collection platform N80-20745
The generation of synthetic seismograms for laterally heterogeneous models using the finite difference technique N80-20962
SEISMOLOGY
Dynamic Green's functions for layered media and applications to boundary-value problems — for earthquake engineering in viscoelastic media N80-20431
Mantle convection and subcrustal stress N80-20752
Remote system software — for a digital seismic data system
[UCID-18191] N80-20791
Pre-stack partial migration N80-20963
Review of ionospheric distrubances resulting from some naturally occuring events
[LA-7984-MS] N80-20970
SELENIDES
N-type molybdenum diselenide-based liquid junction solar cells: A non-aqueous electrolyte system employing the chlorine/chloride couple
[AD-A079712] N80-20871
SEMICONDUCTOR LASERS
Electrooptical devices — including semiconductor lasers and photodiodes
[AD-A077153] N80-20576
SEMICONDUCTORS (MATERIALS)
Evaluation of gallium nitride for active microwave devices
[AD-A079319] N80-20494
Measurement techniques for high power semiconductor materials and devices
[DOE/RA-0041] N80-20506
Emerging materials systems for solar cell applications Cu(2-x)Se
[DOE/ET-23005/T1] N80-20872
Optical determination of the properties of excitons bound to impurities in semiconductors N80-21139
SEPARATED FLOW
Pulsatile laminar flow separation in an exponentially diverging tube N80-20526
Separation control in all apt light pipe
[AD-A079904] N80-20577
SEPARATORS
Development of superior entrainment separators
[PB80-112394] N80-20938
SERIES (MATHEMATICS)
The use of the tetrachoric series for evaluating multivariate normal probabilities
[AD-A079721] N80-21093
SERVICE LIFE
JT9D-7A (SP) jet engine performance deterioration trends
[NASA-TM-81459] N80-20274
SERVOAMPLIFIERS
Pulse-width-modulated amplifier drives for machine tools
[Y/DX-02] N80-20598
SERVOCONTROL
Compliance and force control for computer controlled manipulators
[AD-A077708] N80-21054

SERVOMOTORS
Velocity servo for continuous scan Fourier interference spectrometer
[NASA-CASE-NPO-14093-1] N80-20563
SET THEORY
Results on supercompact cardinals N80-21057
SHALE OIL
Refining and upgrading of synfuels from coal and oil shales by advanced catalytic processes
[FE-2315-37] N80-20407
SHALES
Characterization and analysis of devonian shales as related to release of gaseous hydrocarbons
[ORO-5205-10] N80-20973
SHAPES
Singular finite element shape functions in estimating stress intensity factors N80-20618
SHEAR FLOW
Initial-value problems in stratified shear flows --- geophysics
[AD-A079525] N80-20542
Nonlinear wave process hierarchies and the cyclic development of quasi-ordered structures in turbulent shear flows
[AD-A079619] N80-20545
Remote sensing of ocean surface current and current shear by HF backscatter radar N80-20718
SHEAR PROPERTIES
Transition to turbulence in free shear-layers
[AD-A080066] N80-20547
SHEAR STRESS
Surface temperatures and glassy state investigations in tribology, part 3 --- limiting shear stress rheological model
[NASA-CR-3272] N80-20588
SHELL STABILITY
An investigation of rib stiffened hyperbolic cooling tower under statical loads using discrete field and Galerkin finite element methods N80-20617
SHOCK WAVE INTERACTION
Calculation of oblique-shock-wave laminar-boundary-layer interaction on a flat plate
[NASA-CR-159829] N80-20531
A numerical study of normal-shock/turbulent boundary layer interactions
[AD-A079858] N80-20537
SHOCK WAVES
Stability and transition of wave induced boundary layer flows N80-20226
An analysis of plastic shock waves in snow
[AD-A080051] N80-20467
Wave propagation in three-dimensional inelastic media
[AD-A080061] N80-20468
SHORT CIRCUITS
Cell short circuit, preshort signature N80-20850
SHORT HAUL AIRCRAFT
Human comfort response to random motions with a dominant pitching motion
[NASA-CR-159140] N80-21034
SIBERIA
Geophisical atlas N80-20734
SIDEREAL TIME
Polar motion and Earth rotation results from Lageos N80-20757
SIGNAL ANALYSIS
Characterization of nonstationary clutter
[AD-A079655] N80-20460
SIGNAL PROCESSING
Multienvironment active RF seeker test and evaluation program, MARFS test
[AD-A078161] N80-20455
Signal processing circuit development
[AD-A079053] N80-20465
A note on almost noiseless channels
[AD-A077588] N80-20473
Development of A seismic data collection platform N80-20745
Random signal flaw detection
[AD-A078443] N80-21103
SIGNAL RECEPTION
Transient response of a heterodyne receiver: Implications for a time-of-arrival system
[AD-A078373] N80-20469
SIGNAL TO NOISE RATIOS
A note on almost noiseless channels
[AD-A077588] N80-20473
SIGNAL TRANSMISSION
Digital-phase method of forming single sideband signals --- application to radio communication
[BLL-RTS-11857] N80-20449
SIGNATURE ANALYSIS
NASA-census Application Pilot Test (APT) and urban area delineation studies --- Seattle, Washington; Austin, Texas; Orlando, Florida; Boston, Massachusetts, and Richmond, Virginia N80-20765
Cell short circuit, preshort signature N80-20850
SILANES
Thermal reactor and process --- liquid silicon production from silane
[NASA-CASE-NPO-14369-1] N80-20338
SILICON
Thermal reactor and process --- liquid silicon production from silane
[NASA-CASE-NPO-14369-1] N80-20338
Fabrication, characterization and optimization of poslet (PVF2-silicon) piezoelectric transducers for low frequency 100 Hz to 500 KHz underwater acoustic applications
[AD-A079113] N80-20500
Analysis and evaluation in the production process and equipment area of the low-cost solar array project
[NASA-CR-162904] N80-20814
Development of low cost contacts to silicon solar cells
[NASA-CR-162905] N80-20815
Large area silicon sheet by EFG
[NASA-CR-162907] N80-20816
Low cost thin film polycrystalline silicon solar cells
[DOE/ET-23048/1] N80-20906
SILICON ALLOYS
Production of aluminum-silicon alloy and ferrosilicon and commercial purity aluminum by the direct reduction process, phase B
[CONS/5089-7] N80-20382
SILICON CARBIDES
Dynamic modulus and damping of boron, silicon carbide, and alumina fibers
[NASA-TM-81422] N80-20313
SILICON COMPOUNDS
An experimental, low-cost, silicon-aluminide high-temperature coating for superalloys
[NASA-TM-81455] N80-20370
SILICON DIOXIDE
Studies of P-N junction silicon solar cells N80-20809
SILICON FILMS
Study program to develop and evaluate die and container materials for the growth of silicon ribbons --- for development of low cost solar cells
[NASA-CR-162899] N80-20818
SILICON NITRIDES
Processing research on chemically vapor deposited silicon nitride --- for electromagnetic windows in chemical reactors
[AD-A079328] N80-20349
SILVER HYDROGEN BATTERIES
ESA battery development N80-20840
SIMULATION
Mission simulator test data --- an overview of a real time mission simulation test program of a nickel cadmium battery N80-20855
MIL-M-38510/470 test vectors: Fault detection efficiency measurement via hardware fault simulation --- rca 1802 microprocessor
[NASA-CR-162916] N80-21037
SINGLE CRYSTALS
Evaluation of gallium nitride for active microwave devices
[AD-A079319] N80-20494
SINGLE SIDEBAND TRANSMISSION
Digital-phase method of forming single sideband signals --- application to radio communication
[BLL-RTS-11857] N80-20449
SINGULARITY (MATHEMATICS)
Calculation of the singularity expansion method parameters from the transient response of a thin wire
[AD-A078852] N80-20457
SINTERING
Pressure sintering and creep deformation: A joint modeling approach
[COO-2408-6] N80-20388
SITES
GSFC site stability N80-20741
Geodetic stability of the Green Bank, West Virginia VLBI site N80-20742
SKIDDING
Statewide survey of skid resistances of pavements, 1978
[PB80-106404] N80-20442
Statistical investigation of pavement skid resistance data
[PB80-116114] N80-20446
SKYLAB PROGRAM
Earth resources. A continuing bibliography with indexes, issue 24
[NASA-SP-7041(24)] N80-20717
SLUDGE
Evaluation of dewatering devices for producing high-solids sludge cake
[PB80-111503] N80-21216
Chemical primary sludge thickening and dewatering
[PB80-108970] N80-21222
SNOW
An analysis of plastic shock waves in snow
[AD-A080051] N80-20467
Snow and ice accumulation at solar collector installations in the Chicago metropolitan area
[PB80-113749] N80-20912
SODIUM
Effect of space flight on sodium, copper, manganese and magnesium content in the skeletal bones
[NASA-TM-75506] N80-21025
SOIL MECHANICS
Analysis of the consolidation of layered soils using the method of lines
[PB80-112766] N80-20447
Periglacial research
[AD-A079280] N80-20967
SOIL MOISTURE
Earth Survey Applications Division: Research leading to the effective use of space technology in applications relating to the Earth's surface and interior
[E80-10084] N80-20722
Earth survey applications division: Research leading to the effective use of space technology in applications relating to the Earth's surface and interior
[E80-10067] N80-20723
Remote sensing of leaf water content in the near infrared N80-20768
Effects of wheat irrigation frequency on reflectance in selected spectral bands --- Phoenix, Arizona N80-20771
Relative sensitivity of fifteen spectral bands to changes in soybean canopy cover for wet and dry soils N80-20776
SOL-GEL PROCESSES
Ultrapure glass optical waveguide development in microgravity by the sol-gel process
[NASA-CR-162910] N80-21142
SOLAR ARRAYS
Analysis and evaluation in the production process and equipment area of the low-cost solar array project
[NASA-CR-162904] N80-20814
Large area silicon sheet by EFG
[NASA-CR-162907] N80-20816
Phase 2: Array automated assembly task low cost silicon solar array project
[NASA-CR-162912] N80-20817
Use of Glass Reinforced Concrete (GRCD) as a substrate for photovoltaic modules
[NASA-CR-162898] N80-20819
SOLAR CELLS
Comparison of theoretical and experimental solar cell performance N80-20806
Studies of P-N junction silicon solar cells N80-20809
Analysis and evaluation in the production process and equipment area of the low-cost solar array project
[NASA-CR-162904] N80-20814
Development of low cost contacts to silicon solar cells
[NASA-CR-162905] N80-20815
Study program to develop and evaluate die and container materials for the growth of silicon ribbons --- for development of low cost solar cells
[NASA-CR-162899] N80-20818

N-type molybdenum diselenide-based liquid junction solar cells: A non-aqueous electrolyte system employing the chlorine/chloride couple
[AD-A079712] N80-20871
Emerging materials systems for solar cell applications Cu(2-x)Se
[DOE/ET-23005/T1] N80-20872
Low cost thin film polycrystalline silicon solar cells
[DOE/ET-23048/1] N80-20906

SOLAR COLLECTORS
Combined solar collector and energy storage system
[NASA-CASE-LAR-12205-1] N80-20810
Qualification test procedures and results for Honeywell solar collector subsystem, single-family residence
[NASA-CR-161382] N80-20813
Computer simulation of a solar energy system which utilizes flat-plate collectors
[AD-A079906] N80-20870
Installation and startup of the fixed mirror solar concentrator collector field subsystem
[GA-A-15344] N80-20888
Optical analysis and optimization of line focus collectors
[SERI/TR-34-092] N80-20893
Design and fabrication of prototype combined photovoltaic/thermal non-tracking collector
[SAND-79-7014] N80-20899
Interferometric study of the natural convection characteristics of flat plate, slat and vee-corrugated solar collectors
[COO-2971-6] N80-20900
Snow and ice accumulation at solar collector installations in the Chicago metropolitan area
[PB80-113749] N80-20912
Solar ponds for residential heating, heat extraction from a salt gradient solar pond
[PB80-108624] N80-20913

SOLAR COOLING
National solar heating and cooling programs
[PB80-104987] N80-20915
Marketing and market acceptance data from the Residential Solar Demonstration Program. Volume 1: Detailed analysis, autumn 1979
[PB80-115298] N80-21197

SOLAR ENERGY
Solar rocket system concept analysis
[AD-A079117] N80-20308
Solar energy heating system design package for a single-family residence at New Castle, Pennsylvania
[NASA-CR-161356] N80-20865

SOLAR ENERGY CONVERSION
Market definition study of photovoltaic power for remote villages in the United States
[NASA-CR-159800] N80-20812
Qualification test procedures and results for Honeywell solar collector subsystem, single-family residence
[NASA-CR-161382] N80-20813
The application of DC-DC energy conversion in a solar energy system
[AD-A077112] N80-20867
Computer simulation of a solar energy system which utilizes flat-plate collectors
[AD-A079906] N80-20870
Conversion system overview assessment. Volume 1: Solar thermoelectrics
[SERI/TR-35-078-VOL-1] N80-20882
Environmental assessment methodology: Solar power plant applications. Volume 3. Environmental impact assessment application
[EPRI-ER-1070-VOL-3] N80-20889
Evaluation of a sulfur oxide chemical heat storage process for a steam solar electric plant
[LBL-7868-REV] N80-20890
Performance of heat pumps at elevated evaporating temperatures with application to solar input
[BNL-26772] N80-20896
Methodology for evaluating physical constraints on residential solar energy use
[UCRL-15001] N80-20901
Solar water pumps. Citations from the Engineering Index data base
[PB80-802531] N80-20910
An economical solar heated and cooled residence for southern New Mexico
[PB80-108616] N80-20914
Environmental assessment methodology: Solar power plant applications. Volume 1. Environmental impact assessment methodology
[EPRI-ER-1070-VOL-1] N80-20926

SOLAR GENERATORS
Solar water pumps. Citations from the Engineering Index data base
[PB80-802531] N80-20910

SOLAR HEATING
Combined solar collector and energy storage system
[NASA-CASE-LAR-12205-1] N80-20810
Solar energy heating system design package for a single-family residence at New Castle, Pennsylvania
[NASA-CR-161356] N80-20865
Solar heating system design package for a single-family residence at William O'Brien State Park, Minnesota
[NASA-CR-161357] N80-20866
Residential solar heating and cooling using evacuated tube solar collectors: CSN Solar House 3
[COO-2858-24-SUMM] N80-20887
National solar heating and cooling programs
[PB80-104987] N80-20915
Marketing and market acceptance data from the Residential Solar Demonstration Program. Volume 1: Detailed analysis, autumn 1979
[PB80-115298] N80-21197

SOLAR HOUSES
Solar energy heating system design package for a single-family residence at New Castle, Pennsylvania
[NASA-CR-161356] N80-20865
Residential solar heating and cooling using evacuated tube solar collectors: CSN Solar House 3
[COO-2858-24-SUMM] N80-20887

SOLAR MAGNETIC FIELD
A study of magnetogravity waves N80-20955
On the nature of the apparent response of vorticity area index to the solar magnetic field
[NASA-CR-162915] N80-21239

SOLAR OBSERVATORIES
Doppler observations of solar rotation
[NASA-CR-162886] N80-21238

SOLAR ORBITS
On the production of long-period comets by stellar perturbations of the Oort comet clouds — calculation of orbital perturbation of comets around the Sun due to passing stars N80-21231

SOLAR PHYSICS
To the solar foci — design of experiments to study effect of the solar foci gravity waves and gravitational fields N80-21236

SOLAR PONDS (HEAT STORAGE)
Solar ponds for residential heating, heat extraction from a salt gradient solar pond
[PB80-108624] N80-20913

SOLAR POSITION
Time of day effects on wheat reflectance in fifteen selected bands — Phoenix, Arizona N80-20774
Radiometric resolution for monitoring vegetation: How many bits are needed? N80-20777

SOLAR PROPULSION
Solar rocket system concept analysis
[AD-A079117] N80-20308

SOLAR ROTATION
Doppler observations of solar rotation
[NASA-CR-162886] N80-21238
The rotation of the Sun: Observations at Stanford — using the Doppler effect
[NASA-CR-162914] N80-21240

SOLAR SENSORS
Improved Sun-sensing guidance system for high-altitude aircraft
[NASA-CASE-FRC-11052-1] N80-20249

SOLAR SPECTRA
Analysis of time dependent phenomena observed with the LPSP OSO-8 instrument — solar chromosphere and photosphere
[NASA-CR-162908] N80-21237

SOLAR TERRESTRIAL INTERACTIONS
On the nature of the apparent response of vorticity area index to the solar magnetic field
[NASA-CR-162915] N80-21239

SOLID PROPELLANT ROCKET ENGINES
Initiation mechanisms of solid rocket propellant detonation
[AD-A079986] N80-20411

SOLID STATE DEVICES
Signal processing circuit development
[AD-A079053] N80-20465
Superconducting fault current limiter
[CONS/3015-T1] N80-20507

SOLID SURFACES
On flame spread mechanism over combustible solid surface
[BLL-RTS-12027] N80-20327

SOLID WASTES
Assessment of the impact of resource recovery on the environment
[PB80-102874] N80-20948

SOLIDIFICATION
Investigation of in situ composites for electromagnetic device applications with emphasis on development of microwave tube cathodes and high resolution displays
[AD-A079698] N80-20321
Characterization of casting defects in typical castings of a directionally solidified superalloy
[AD-A077270] N80-20376

SOLITARY WAVES
Finite-amplitude solitary water waves
[AD-A079718] N80-20546

SORBENTS
Further characterization of sorbents for environmental sampling
[PB80-118763] N80-20944

SOUND TRANSDUCERS
Six-foot line transducer calibration procedure: Explains theory, methodology, and procedures used at Sensor Accuracy Check Site (SACS), Long Beach, California
[AD-A079522] N80-21102

SOUND TRANSMISSION
A model theory for the fibrous absorber. Part 1: Regular fibre arrangements
[NASA-TM-75800] N80-21101

SOUND WAVES
A model theory for the fibrous absorber. Part 1: Regular fibre arrangements
[NASA-TM-75800] N80-21101

SOUTH AMERICA
Geophysical atlas N80-20734
Gravity model development N80-20748

SOUTH CAROLINA
Crustal structure and dynamics of southeastern US — Maryland, Virginia, North Carolina, South Carolina, West Virginia, Georgia, Tennessee, and Kentucky N80-20738

SOUTH DAKOTA
Energy source book — Colorado, Montana, North Dakota, South Dakota, Utah, and Wyoming
[DOE/TIC-10190] N80-20895

SOUTHERN CALIFORNIA
Plate boundary deformation in California — Southern California: Elsinore, Earthquake Valley, and San Felipe Faults N80-20739
On the slection of station sites for observing strain steps and earthquake forerunners in California N80-20740

SOYBEANS
Assessing soybean leaf area and leaf biomass by spectral measurements — Beltsville, Maryland Agricultural Research Center N80-20775
Relative sensitivity of fifteen spectral bands to changes in soybean canopy cover for wet and dry soils N80-20776
Thematic mapper versus multispectral scanner for crop monitoring N80-20778
Spectra of isolated vegetational constituents N80-20779

SPACE CHARGE
AFSIM, an Air Force sattellite interactions model
[AD-A078032] N80-20300

SPACE ERECTABLE STRUCTURES
Closed cell structures using triangular plates N80-20615

SPACE FLIGHT
Coding, testing and documentation of processors for the flight design system
[NASA-CR-160552] N80-20289
Effect of space flight on sodium, copper, manganese and magnesium content in the skeletal bones
[NASA-TM-75506] N80-21025

SPACE HEATING (BUILDINGS)
Qualification test procedures and results for Honeywell solar collector subsystem, single-family residence
[NASA-CR-161382] N80-20813

Solar heating system design package for a single-family residence at William O'Brien State Park, Minnesota
[NASA-CR-161357] N80-20666
Energy efficient buildings program
[LBL-9576] N80-20677
Heat-pump-centered integrated community energy systems: System development
[ANL/CNSV-TM-8] N80-20680
Thermal energy storage application areas --- for building heating and cooling
[CONS/5113-T4] N80-20694
Solar ponds for residential heating, heat extraction from a salt gradient solar pond
[PB80-108624] N80-20913
An economical solar heated and cooled residence for southern New Mexico
[PB80-108616] N80-20914
Marketing and market acceptance data from the Residential Solar Demonstration Program. Volume 1: Detailed analysis, autumn 1979
[PB80-115298] N80-21197
Geothermal energy market penetration: Development of a model for the residential section
[PB80-118359] N80-21198

SPACE MISSIONS
Solar rocket system concept analysis
[AD-A079117] N80-20308
The Apollo spacecraft: A chronology volume 4, 21 January 1966 - 13 July 1974
[NASA-SP-4009] N80-20437

SPACE PERCEPTION
Distance estimation from cognitive maps
[AD-A080098] N80-20798

SPACE SHUTTLE ORBITERS
Use of an aerodynamic turn to maximize the orbit inclination change for the space shuttle orbiter
[AD-A079655] N80-20291

SPACE SHUTTLES
Structural tests on a tile/strain isolation pad thermal protection system --- space shuttles
[NASA-TM-80226] N80-20302
Development of LaRC 160/NR150B2 polyimide graphite hybrid composites --- for shuttle applications
[NASA-CR-159196] N80-20315
Nonlinear static TPS analysis
[NASA-TM-81785] N80-20620

SPACE SIMULATORS
Spacecraft test chamber contamination study in the AEDC Mark 1 facility
[AD-A079638] N80-20296

SPACE TRANSPORTATION SYSTEM
Technology requirements for future Earth-to-geosynchronous orbit transportation systems. Volume 3: Appendices
[NASA-CR-159174] N80-20303

SPACEBORNE EXPERIMENTS
The LDEF heat pipe experiment power systems
N80-20843
Fifth Working Conference (Space Biology) at the 21st Plenary Session of COSPAR
[NASA-TM-78107] N80-21017

SPACEBORNE PHOTOGRAPHY
Aerial and space-borne photographic maps
N80-20667

SPACECRAFT CABIN ATMOSPHERES
The Apollo spacecraft: A chronology volume 4, 21 January 1966 - 13 July 1974
[NASA-SP-4009] N80-20437

SPACECRAFT CHARGING
AFSIM, an Air Force satellite interactions model
[AD-A079032] N80-20300

SPACECRAFT INSTRUMENTS
Recommendations of OSTA Flight Technology Improvement Workshop-Power Subsystems panel
N80-20822

SPACECRAFT MODULES
Parallel 50 ampere hour nickel cadmium battery performance in the Modular Power Subsystems (MPS)
N80-20841

SPACECRAFT ORBITS
Use of an aerodynamic turn to maximize the orbit inclination change for the space shuttle orbiter
[AD-A079655] N80-20291

SPACECRAFT POWER SUPPLIES
Lightweight fuel cell powerplant components program
[NASA-CR-161412] N80-20306
The 1979 Goddard Space Flight Center Battery Workshop
[NASA-CP-2117] N80-20820
Recommendations of OSTA Flight Technology Improvement Workshop-Power Subsystems panel
N80-20822
NATO: In-orbit experience N80-20836
RCA Satcom: In-orbit experience N80-20837
Update of the IUE battery in-flight performance
N80-20838
Discussion of the SAGE anomaly N80-20839
ESA battery development N80-20840
Parallel 50 ampere hour nickel cadmium battery performance in the Modular Power Subsystems (MPS) N80-20841
NASA 50 amp hour nickel cadmium battery waste heat determination N80-20842
The LDEF heat pipe experiment power systems
N80-20843
Battery reconditioning, summary of TRW experience N80-20847
Cell short circuit, preshort signature N80-20850
NWSC nickel cadmium spacecraft cell accelerated life test program data analysis N80-20852
Intelsat-V: Nickel-hydrogen battery N80-20861
Environmental development plan for space applications --- development of nuclear power supplies for use in space
[DOE/EDP-0057] N80-20922
Selection of power plant elements for future reactor space electric power systems
[LA-7858] N80-21133

SPACECRAFT STRUCTURES
Design, fabrication and test of graphite/polyimide composite joints and attachments for advanced aerospace vehicles
[NASA-CR-159110] N80-20316

SPARK CHAMBERS
Inorganic spark chamber frame and method of making the same
[NASA-CASE-GSC-12354-1] N80-20565

SPARK IGNITION
Combustion and operating characteristics of spark-ignition engines
[NASA-CR-162896] N80-20340

SPATIAL DISTRIBUTION
AOP-supported color separation N80-20684

SPECTRAL BANDS
Multispectral linear array sensor development
N80-20783

SPECTRAL RECONNAISSANCE
Assessment of satellite and aircraft multispectral scanner data for strip-mine monitoring
[NASA-TM-79268] N80-20787
Computer processing of multispectral scanner data over coal strip mines
[PB80-111677] N80-20803

SPECTRAL REFLECTANCE
Improvement in classification accuracy of LANDSAT MSS data in areas of mountainous terrain
N80-20766
Remote sensing of leaf water content in the near infrared N80-20768
Plant stress and relationships to spectral responses --- cotton and tomato plants N80-20769
Effects of wheat irrigation frequency on reflectance in selected spectral bands --- Phoenix, Arizona
N80-20771
Off-nadir viewing effects on spectral assessment of green biomass N80-20772
Time of day effects on wheat reflectance in fifteen selected bands --- Phoenix, Arizona N80-20774
Assessing soybean leaf area and leaf biomass by spectral measurements --- Beltsville, Maryland Agricultural Research Center N80-20775
Relative sensitivity of fifteen spectral bands to changes in soybean canopy cover for wet and dry soils N80-20776
Radiometric resolution for monitoring vegetation: How many bits are needed? N80-20777
Thematic mapper versus multispectral scanner for crop monitoring N80-20778
Spectra of isolated vegetational constituents
N80-20779
Evaluation of a spectral method for percentage green determination using clipped rangeland forage samples --- Texas N80-20781

SPECTRAL SENSITIVITY
Effects of wheat irrigation frequency on reflectance in selected spectral bands --- Phoenix, Arizona
N80-20771
Off-nadir viewing effects on spectral assessment of green biomass N80-20772
Thermal anisotropy of vegetation canopies --- Phoenix, Arizona N80-20773
Time of day effects on wheat reflectance in fifteen selected bands --- Phoenix, Arizona N80-20774
Relative sensitivity of fifteen spectral bands to changes in soybean canopy cover for wet and dry soils N80-20776
Thematic mapper versus multispectral scanner for crop monitoring N80-20778
LANDSAT-D assessment system N80-20782

SPECTRAL SIGNATURES
Report of the IGP Working Group 7-9 'Spectral Signatures of Objects' N80-20713
Geobotanical exploration --- Mineral, Virginia
N80-20724
Remote monitoring of forest cover conditions --- deciduous tree defoliation in Pennsylvania
N80-20763
NASA-census Application Pilot Test (APT) and urban area delineation studies --- Seattle, Washington; Austin, Texas; Orlando, Florida; Boston, Massachusetts, and Richmond, Virginia N80-20765
Spectra of isolated vegetational constituents
N80-20779
A spectral method for determining the percentage of green herbage material in clipped samples
N80-20780
Linear array pushbroom radiometer data analysis
N80-20784

SPECTROMETERS
Velocity servo for continuous scan Fourier interference spectrometer
[NASA-CASE-NPO-14093-1] N80-20563
Deep inelastic muon scattering at Fermi Lab --- using a multimuon spectrometer
[COO-3000-T2] N80-21122

SPECTROSCOPIC ANALYSIS
Physics with fast molecular-ion beams
[ANL/PHY-79-3] N80-21115

SPECTROSCOPY
Time resolved spectroscopy using synchrotron radiation
[LBL-9475] N80-20354
A study by optical spectroscopy of chemiluminescent reactions between ions and molecules for N(+)+NO yields N2(+)* +O
[MPIS-4/1979] N80-21126
Research activities of the Institute for Extraterrestrial Physics
[MPI-PAE/EXTRATERR-150] N80-21223

SPECTRUM ANALYSIS
Application of inelastic electron tunneling spectroscopy to the study of inhibition of aluminum corrosion N80-20367
A Differential population synthesis approach to mass segregation in M92 N80-20614
Measurements and calculations of electronic excitation from collisions between atoms of alkalis and mercury in the energy range 10 eV to 1400 eV
[MPIS-24/1978] N80-21181
The structure and dynamics of H2 regions
N80-21229

SPEECH
Speech bandwidth reduction
[PB80-103955] N80-20479

SPEECH RECOGNITION
Noise suppression methods for robust speech processing
[AD-A079321] N80-20466

SPEED INDICATORS
A calibration of the Preston tube in liquid flow systems
[AD-A079876] N80-20538

SPHERES
A diagonally dominant solution for the cylinder end problem and a non-axisymmetric elasticity solution for a truncated spherical dome N80-20612

SPHERICAL HARMONICS
Comparison of algorithms for the summation of spherical plane functions N80-20699
Spherical harmonic models of the core field
N80-20727
Gravity model development N80-20748

The gravity field in the central pacific from satellite-to-satellite tracking and implications for mantle convection N80-20750
Information theory density distribution --- Earth Mantle N80-20753
The enhanced nodal equilibrium ocean tide and polar motion N80-20754
Starlette orbit analyses for ocean tidal studies N80-20762

SPIRAL WRAPPING
Research and development on a spiral-wound membrane system for single-stage seawater desalination
[PB80-114705] N80-20357

SPLINES
Interpolation and data fitting with splines
[UCID-18329] N80-21083

SPRAY CHARACTERISTICS
Controlled overspray spray nozzle
[NASA-CASE-MFS-25139-1] N80-20528

SPRAY NOZZLES
Controlled overspray spray nozzle
[NASA-CASE-MFS-25139-1] N80-20528

SPRAYED COATINGS
Controlled overspray spray nozzle
[NASA-CASE-MFS-25139-1] N80-20528

SPREAD F
Preliminary report of numerical simulation of intermediate wavelength collisional Rayleigh-Taylor instability in equatorial spread F
[AD-A079307] N80-20969

SPRINGS (ELASTIC)
Design of helical compression springs
[AD-A077113] N80-20593
Coil spring failures in aerospace hardware
[AD-A077808] N80-20595

STABILITY
Nongeostrophic baroclinic instability of two fluids --- stability analysis of fluid in a rotating cylinder N80-20517

STAINLESS STEELS
Subgrain refinement strengthening in stainless steel alloys N80-20368
Effect of heat treatment on fracture of type 304L stainless steel in a hydrogen environment
[DP-MS-79-18] N80-20384
Inertia and friction welding of aluminum alloy 1100 to type 316 stainless steel
[Y-2165-REV] N80-20596

STANDARDIZATION
A standardization evaluation potential study of the common multi-mode radar program
[AD-A079678] N80-20459

STANDARDS
American National Standard N538-1979 classification of industrial ionizing radiation gauging devices --- safety aspects
[PB80-11012] N80-20569
Development document for effluent limitations guidelines and new source performance standards for the mineral mining and processing point source category
[PB80-110299] N80-20940

STAR TRACKERS
Millstone Hill Radio Star Calibration
[AD-A079037] N80-20475

STATIC THRUST
An experimental study of static thrust augmentation using a 2-d variable ejector
[AD-A079857] N80-20279

STATISTICAL ANALYSIS
Studies of the statistical bias and signal characteristics of laser velocimeters
[AD-A079634] N80-20579
Some contributions to gamma-minimax and empirical Bayes selection procedures N80-21085
Smoothness priors and the distributed lag estimator
[AD-A075574] N80-21090
Kaon-proton backward elastic scattering between 476 and 1084 MeV/c
[LBL-8969] N80-21120
Sensitivity on the parameters of the regional hydrology model for the Nevada nuclear waste storage investigations
[SAND-79-1197C] N80-21132

STATISTICAL MECHANICS
Turbulence and statistical mechanics
[AD-A079757] N80-20536

STEADY STATE
Steady motions exhibited by Duffing's equation: A picture book of regular and chaotic motions
[IPPJ-434] N80-21155

STEEL STRUCTURES
Stress corrosion environmental effects on AF 1410 --- aircraft construction materials
[AD-A078598] N80-20374

STEELS
Stress corrosion of steel. A bibliography with abstracts
[PB80-803729] N80-20394
Materials and mechanics of rate effects in brittle fracture --- cantilever beams and steels
[COO-2422-22] N80-20635
Extension of the Vaughan-Florence analysis of dynamic buckling of a rigid-plastic cylindrical shell
[COO-4122-28] N80-20637
Acoustic emission monitoring of steel and concrete structural elements with particular reference to primary nuclear containment structures
[CONF-790966-1] N80-21105

STELLAR ATMOSPHERES
Analysis of time dependent phenomena observed with the LPSP OSO-8 instrument --- solar chromosphere and photosphere
[NASA-CR-162908] N80-21237

STELLAR EVOLUTION
Late-stage evolution of supernova remnants N80-21227

STELLAR SPECTRA
A Differential population synthesis approach to mass segregation in M92 N80-20614

STEREOCHEMISTRY
Determination of molecular-ion structures through studies of the collisionally-induced dissociation of fast (MeV) molecular ions
[CONF-790843-10] N80-21116

STEREOSCOPY
Multispectral linear array sensor development N80-20783

STERILIZATION
Portable heatable container
[NASA-CASE-NPO-14237-1] N80-20808

STIRLING CYCLE
Supporting research and technology for automotive Stirling engine development
[NASA-TM-81495] N80-21200

STOICHIOMETRY
Asymptotic analysis of near-stoichiometric flame propagation N80-20330

STORAGE BATTERIES
Characterization of prototype secondary lithium battery N80-20832
Rechargeable ambient temperature lithium cells N80-20833
The Exxon rechargeable cells --- solar rechargeable clocks N80-20834
High temperature storage characteristics of lithium sulfur dioxide cells N80-20835
Status of the DOE battery and electrochemical technology program
[MTR-8026] N80-20902

STORAGE STABILITY
Stability survey of hydrocarbon fuels
[BETC-1778-4] N80-20424
High temperature storage characteristics of lithium sulfur dioxide cells N80-20835

STORMS (METEOROLOGY)
Nowcast and short-range (0-2 hour) forecasts of thunderstorms and severe convective weather for use in air traffic control
[AD-A080426] N80-20247
National winter storms operations plan
[PB80-118425] N80-21000

STRAIN GAGES
Attaching of strain gages to substrates
[NASA-CASE-FRC-10093-1] N80-20560
Evaluation of some cryogenic sensors and instrumentations for a large superconducting MHD magnet
[CONF-790815-30] N80-20568

STRAIN HARDENING
Subgrain refinement strengthening in stainless steel alloys N80-20368
Large-strain deformation of a mild steel at intermediate temperatures N80-20369
Strain hardening of iron, axisymmetric vs plane strain elongation
[CONF-790801-5] N80-20380

STRATIFICATION
Analysis of the consolidation of layered soils using the method of lines
[PB80-112766] N80-20447

STRATIFIED FLOW
Development and applications of a lamellar model for analysis of liquid-liquid mixing N80-20521
Initial-value problems in stratified shear flows --- geophysics
[AD-A079525] N80-20542
Laboratory study of flow and thermal structures in heated and/or cooled layers of water
[PB80-120694] N80-20556

STRATOSPHERE
Day-night differences in radiosonde observations of the stratosphere and troposphere
[PB80-117989] N80-20995

STREAMLINED BODIES
Determination of streamline geometry and equivalent radius over arbitrary bodies with application to three-dimensional drag problem
[AD-A077878] N80-20535

STRESS (BIOLOGY)
Remote sensing of leaf water content in the near infrared N80-20768
Plant stress and relationships to spectral responses --- cotton and tomato plants N80-20769
Effects of wheat irrigation frequency on reflectance in selected spectral bands --- Phoenix, Arizona N80-20771

STRESS (PHYSIOLOGY)
Adrenocortical response in rats subjected to a stress of restraint by immobilization whether accompanied by hypothermia or not
[NASA-TM-76119] N80-21015
Atherosclerotic changes of vessels caused by restriction of movement
[NASA-TM-76022] N80-21020

STRESS ANALYSIS
Calculation of residual principal stresses in CVD boron on carbon filaments
[NASA-TM-81456] N80-20314
Nonlinear static TPS analysis
[NASA-TM-81785] N80-20620
States of stress and strain in adhesive joints, including photoelastic imaging of defects in adherends
[AD-A079515] N80-20631
Mod 1 wind turbine generator failure modes and effects analysis
[NASA-CR-159494] N80-20864

STRESS CONCENTRATION
Investigation of elongation of boron filament during fabrication and annealing N80-20310
Finite-element analysis of problems involving stress singularities --- including lap joints and elastic crack problems N80-20610
Singular finite element shape functions in estimating stress intensity factors N80-20618
Use of two-dimensional transmission photoelastic models to study stresses in double-lap bolted joints: Load transfer and stresses in the inner lap
[VPI-E-80-9] N80-20621

STRESS CORROSION
X-ray analysis of accrued damage in stress corrosion and corrosion fatigue --- 304 austenitic stainless steel and al 2024
[AD-A078511] N80-20372
Stress corrosion of steel. A bibliography with abstracts
[PB80-803729] N80-20394

STRESS CORROSION CRACKING
Stress corrosion environmental effects on AF 1410 --- aircraft construction materials
[AD-A078598] N80-20374
Stress corrosion of steel. A bibliography with abstracts
[PB80-803729] N80-20394

STRESS RELAXATION
Load relaxation and transmission electron microscopy studies of germanium N80-21169

STRESS TENSORS
Measurement of transient response of a central crack to a tensile pulse N80-20609

STRESS-STRAIN DIAGRAMS
Transverse compressive testing of thick Kevlar/epoxy laminates
[SAND-79-0176] N80-20322

STRESS-STRAIN RELATIONSHIPS
On the theory of cyclic viscoplasticity --- stress-strain response N80-20608
On the load displacement relation for a cracked rectangular specimen with constrained ends
[AD-A075527] N80-20624
Earthquake and crustal deformation studies --- San Francisco and Fort Ross, California N80-20743

STRIP MINING
Assessment of satellite and aircraft multispectral scanner data for strip-mine monitoring
[NASA-TM-79268] N80-20787
Computer processing of multispectral scanner data over coal strip mines
[PB80-111677] N80-20803

STRONTIUM ISOTOPES
Strontium isotopic and trace element geochemistry of the Saddle Mountains and Grande Ronde Basalts of the Columbia River Basalt group N80-20958

STRUCTURAL ANALYSIS
Development of a procedure for estimating the high cycle fatigue strength of some high temperature structural alloys
[BNL-NUREG-26085] N80-20378
Pressure sintering and creep deformation: A joint modeling approach
[COO-2408-6] N80-20388
ANSR-2: Analysis of nonlinear structural response, user's manual
[PB80-113301] N80-20440
Effect of imperfections on the collapse of rectangular plates using variational calculus
[AD-A079905] N80-20627
Analytical/experimental investigation of the instability of composite cylindrical panels
[AD-A079850] N80-20628
Extension of the Vaughan-Florence analysis of dynamic buckling of a rigid-plastic cylindrical shell
[COO-4122-28] N80-20637
PLASTIC CANOPY: A computer program for the structural analysis of protective canopies
[PB80-122724] N80-20798

STRUCTURAL BASINS
Comparative planetology/crustal evolution N80-20735

STRUCTURAL DESIGN
Standard engineering installation package AN/TSQ-117, aircraft control central
[AD-A079776] N80-20254
Space truss design: The polyhedral chain group N80-20434
Conceptual design study of the hylife lithium waterfall laser fusion chamber
[UCRL-13944] N80-20583
Closed cell structures using triangular plates N80-20615
Design and fabrication of prototype combined photovoltaic/thermal non-tracking collector
[SAND-79-7014] N80-20899

STRUCTURAL DESIGN CRITERIA
Structural evaluation of sulphur-asphalt pavements N80-20436

STRUCTURAL FAILURE
Advanced composites: Design and application. Proceedings of the meeting of the Mechanical Failures Prevention Group
[NASA-CR-162864] N80-20325

STRUCTURAL MEMBERS
Acoustic emission monitoring of steel and concrete structural elements with particular reference to primary nuclear containment structures
[CONF-790966-1] N80-21105

STRUCTURAL PROPERTIES (GEOLOGY)
Geological/geophysical resource assessment --- Rio Grande rift N80-20725
Regional Modeling: The Kentucky anomaly N80-20730
Regional modeling: The Ivrea zone --- Northern Italy N80-20731
Interpretation of geoid anomalies in the vicinity of subduction zones --- Tonga-Kermadec and the New Hebrides island arc, North Fiji, South Fiji and Lau-havre N80-20732
Global geology and geophysics using satellite-derived data N80-20733
Crustal structure and dynamics of southeastern US --- Maryland, Virginia, North Carolina, South Carolina, West Virginia, Georgia, Tennessee, and Kentucky N80-20738
Plate boundary deformation in California --- Southern California: Elsinore, Earthquake Valley, and San Felipe Faults N80-20739
GSFC site stability N80-20741
Geodetic stability of the Green Bank, West Virginia VLBI site N80-20742
Global intra-plate volcanism N80-20744
Geomorphology of Martian valleys N80-21232
Impact craters from centimeters to megameters N80-21233

STRUCTURAL RELIABILITY
Acoustic emission: Who needs it and why? --- pressure vessel reliability
[HEDL-SA-1808-FP] N80-20605

STRUCTURAL STRAIN
Structural tests on a tile/strain isolation pad thermal protection system --- space shuttles
[NASA-TM-80226] N80-20302

SUBSONIC FLOW
Laser-Raman measurements in a ducted, two-stream, subsonic, H2/air combustion flow
[AD-A078112] N80-20233

SUBSONIC SPEED
Ground plane effects on a contoured surface at low subsonic velocities
[AD-A079877] N80-20237

SUBSTRATES
Attaching of strain gages to substrates
[NASA-CASE-FRC-10093-1] N80-20560

SUGAR BEETS
Monitoring drought in Colorado with LANDSAT MSS N80-20770

SULFUR
Structural evaluation of sulphur-asphalt pavements N80-20436

SULFUR DIOXIDES
Galileo lithium/SO2 N80-20827
Sulfur studies on lithium sulfur dioxide batteries N80-20828
High temperature storage characteristics of lithium sulfur dioxide cells N80-20835

SULFUR OXIDES
Evaluation of a sulfur oxide chemical heat storage process for a steam solar electric plant
[LBL-7868-REV] N80-20890

SULFURIC ACID
Structural assessment of involutes
[AD-A077875] N80-20318
Vapor pressure and melting behavior of sulfuric acid-water systems
[PB80-116007] N80-20363

SUMMER
Summer circulation over South America from satellite data N80-20983

SUPERCONDUCTING MAGNETS
Evaluation of some cryogenic sensors and instrumentations for a large superconducting MHD magnet
[CONF-790815-30] N80-20568
The 1-GWh diurnal load-leveling superconducting magnetic energy storage system reference design. Appendix C: Dewar and structural support
[LA-7885-MS-VOL-6] N80-20897
Superconducting magnet system for the SPIRIT cosmic ray space telescope
[LBL-9699] N80-21225

SUPERCONDUCTIVITY
Influence of magnetic ordering on the superconducting properties of amorphous (Zr/sub 1-x/Er/sub x/)3Rh alloys
[CALT-822-110] N80-20502
Superconducting fault current limiter
[CONS/3015-T1] N80-20507

SUPERCONDUCTORS
Fabrication of superconducting wire composites by directional solidification
[IS-4698] N80-20501
Modeling and error analysis of a superconducting gravity gradiometer N80-20557
Roles of crystal fields in magnetic superconducting rare-earth rhodium borides
[LA-UR-79-3174] N80-21175

SUPERCRITICAL WINGS
Transonic unsteady airloads on an energy efficient transport wing with oscillating control surfaces
[NASA-TM-81788] N80-20228

SUPERNOVA REMNANTS
Late-stage evolution of supernova remnants N80-21227

SUPERNOVAE
Late-stage evolution of supernova remnants N80-21227

SUPERSONIC CRUISE AIRCRAFT RESEARCH
Example of performance analysis using data obtained concurrently in air-path, body and Earth axes
[ESDU-79018] N80-20225
Aerodynamic design and analysis of the AST-204, AST-205, and AST-206 blended wing-fuse large supersonic transport configuration concepts
[NASA-CR-159223] N80-20232

SUPERSONIC FLOW
Complete supersonic flowfields over blunt bodies in a generalized orthogonal coordinate system
[NASA-TM-81784] N80-20529
Downstream mixing gasdynamic lasers: A numerical solution --- of supersonic mixing flows below the nozzle exit N80-20572

SUPERSONIC TRANSPORTS
Aerodynamic design and analysis of the AST-204, AST-205, and AST-206 blended wing-fuse large supersonic transport configuration concepts
[NASA-CR-159223] N80-20232

SURFACE ACOUSTIC WAVE DEVICES
Metal-insulator-semiconductor aspects of monolithic zinc oxide surface acoustic wave structures N80-20483
Development of numerical techniques and computer systems for design, analysis and fabrication of interdigital transducers as surface acoustic wave devices
[AD-A079623] N80-20493

SURFACE EFFECT SHIPS
Lift analysis on the bow seal of the surface effect ship testcraft XR-3
[AD-A078507] N80-20439

SURFACE ENERGY
Energy of 100 coincidence twist boundaries in transition metal oxides
[CONF-7907101-2] N80-21179

SURFACE FINISHING
The Science of Ceramic Machining and Surface Finishing 2 --- conferences
[PB80-110133] N80-20441
Grinding and polishing articles in bulk: Burnishing
[NASA-TM-75774] N80-20590
Development of low cost contacts to silicon solar cells
[NASA-CR-162905] N80-20815

SURFACE PROPERTIES
A fundamental approach to adhesion: Synthesis, surface analysis, thermodynamics and mechanics --- acid-base properties of titanium 6-4 surfaces
[NASA-CR-162903] N80-20397
Effects of surface structure on secondary electron emission N80-21170

SURFACE REACTIONS
Application of inelastic electron tunneling spectroscopy to the study of inhibition of aluminum corrosion N80-20367

SURFACE ROUGHNESS
A variational approximation for scattering of scalar waves by stochastic surfaces
[AD-A077066] N80-20463
Texture primitive extraction using an edge-based approach
[AD-A078085] N80-21051

SURFACE TEMPERATURE
Thermal response and reusability tests of advanced flexible Reusable Surface Insulation (RSI) and ceramic tile RSI samples at surface temperatures to 1200 degrees F
[AD-A077887] N80-20399
Surface temperatures and glassy state investigations in tribology, part 3 --- limiting shear stress rheological model
[NASA-CR-3272] N80-20588
Thermal anisotropy of vegetation canopies --- Phoenix, Arizona N80-20773
Estimating nocturnal surface temperature in Florida using thermal data from geostationary satellite data N80-20982
Temperatures generated by underground storage of defense waste canisters
[DP-MS-79-37] N80-21135

SURFACE WATER
Determination of selected anions in water by ion chromatography
[PB80-111941] N80-20356

Airborne laser fluorosensing of surface water chlorophyll a --- Lake Mead, Nevada
[PB80-113400] N80-20797

SURFACTANTS
Applications of liquid chromatography in the field of surface-active compounds
[BLL-RTS-11948] N80-20326

SURVEILLANCE
Passive infrared surveillance. Part 1: Model formulation
[AD-A075603] N80-21145

SURVEYS
International scientific interest in the question of CO2 induced climate change
[UCID-18332] N80-20985

SURVIVAL EQUIPMENT
F-4 Phantom aircrew survival equipment evaluation
[AD-A076330] N80-20245

SWITCHING CIRCUITS
A 20 bit plus sign, relay switched D/A converter
[PB80-105331] N80-20509

SYMBOLS
A symbol disk with interchangeable symbols and its applications to cartography N80-20677
Experiences gathered with a symbol disk with interchangeable symbols N80-20688

SYNCHRONIZERS
Memory-based frame synchronizer --- for voice data processing in digital communication systems
[NASA-CASE-GSC-12430-1] N80-20453

SYNCHRONOUS MOTORS
Development and evaluation of a model doubly-fed machine
[PB80-100662] N80-20916

SYNCHRONOUS SATELLITES
Satellite personal communications system
[NASA-CASE-NPO-14480-1] N80-20448
Satellite activities of NOAA 1978 --- geostationary and polar orbiting systems
[PB80-112782] N80-21002

SYNCHROTRON RADIATION
Time resolved spectroscopy using synchrotron radiation
[LBL-9475] N80-20354

SYNOPTIC METEOROLOGY
Monthly climatology for evaporation duct occurrence in the North Atlantic Ocean
[AD-A075524] N80-20992

SYNTHETIC FUELS
Refining and upgrading of synfuels from coal and oil shales by advanced catalytic processes
[FE-2315-37] N80-20407
Synthetic fuels from peat gasification
[CONF-790803-55] N80-20412
Liquid phase methanation/shift pilot plant operation and laboratory support work
[FE-2036-37] N80-20413
Zinc halide hydrocracking process for distillate fuels from coal
[FE-1743-68] N80-20426
Biomass energy systems: Environmental readiness document
[DOE/ERD-0021] N80-20905

SYSTEM EFFECTIVENESS
Bounding the reliability of multistate systems
[AD-A075579] N80-20602

SYSTEM FAILURES
Hydraulic diagnostic monitoring system
[AD-A077552] N80-20594
Common cause failure analysis techniques: A review and comparative evaluation
[TREE-1349] N80-20603
Mod 1 wind turbine generator failure modes and effects analysis
[NASA-CR-159494] N80-20864

SYSTEMS ANALYSIS
Technology requirements and readiness for very large aircraft
[NASA-TM-81783] N80-20223
A study of two avionics life cycle cost models and their applicability
[AD-A076981] N80-20268
Solar rocket system concept analysis
[AD-A079117] N80-20308
Material implications of design and system studies for inertial confinement fusion systems
[UCRL-82041] N80-21163

SYSTEMS ENGINEERING
Research and development on a spiral-wound membrane system for single-stage seawater desalination
[PB80-114705] N80-20357
Gallium arsenide lasers. A bibliography with abstracts
[PB80-803612] N80-20585
Solar energy heating system design package for a single-family residence at New Castle, Pennsylvania
[NASA-CR-161356] N80-20865
Solar heating system design package for a single-family residence at William O'Brien State Park, Minnesota
[NASA-CR-161357] N80-20866
Superconducting magnet system for the SPIRIT cosmic ray space telescope
[LBL-9699] N80-21225

T

TACAN
Airborne electronic terrain map system: A literature review
[AD-A079402] N80-20255

TAKEOFF
Airborne aids for coping with low-level wind shear. All-weather landing systems, engineering services support project, task 2 --- the use of aircraft instruments, flight simulation techniques, and mathematical models to understand wind shear effects during aircraft approach and takeoff
[AD-A080589] N80-20242

TARGET RECOGNITION
Near-millimeter wave technology base study. Volume 1: Propagation and target/background characteristics
[AD-A079620] N80-20461

TARS
Control technologies for particulate and tar emissions from coal converters
[PB80-106392] N80-20949

TASK COMPLEXITY
Summary of Department of Transportation/Federal Aviation Administration task force on crew workload report
[AD-A068189] N80-21032

TAYLOR INSTABILITY
Preliminary report of numerical simulation of intermediate wavelength collisional Rayleigh-Taylor instability in equatorial spread F
[AD-A079307] N80-20969

TDR SATELLITES
TDRSS battery life cycle tests interim report
N80-20645

TEA LASERS
Generation of 16 micron radiation using stimulated rotational Raman scattering in hydrogen --- using a CO2 TEA laser N80-20573

TECHNOLOGICAL FORECASTING
The role of technology as air transportation faces the fuel situation
[NASA-TM-81793] N80-20260
Technology requirements for future Earth-to-geosynchronous orbit transportation systems. Volume 3: Appendices
[NASA-CR-159174] N80-20303
Analysis of current trends in U.S. petroleum and natural gas production
[PB80-116056] N80-20800
Projections of direct energy consumption by mode: The 1975 - 2000 baseline
[ANL/CNSV-4] N80-20878
Industrial Sector Technology Use Model (ISTUM): Industrial energy use in the United States, 1974 - 2000. Volume 2: Results
[DOE/FE-2344/2] N80-20885
The impact of future diesel emissions on the air quality of large cities
[PB80-113657] N80-20947

TECHNOLOGY ASSESSMENT
The role of technology as air transportation faces the fuel situation
[NASA-TM-81793] N80-20260
Survey of biomass gasification. Volume 1: Synopsis and executive summary
[SERI/TR-33-239-VOL-1] N80-20427
Solid-state amplifiers and image converters
[BLL-RTS-11799] N80-20480
Overview of NASA battery technology program
N80-20821
Recommendations of OSTA Flight Technology Improvement Workshop-Power Subsystems panel
N80-20822
Conversion system overview assessment. Volume 1: Solar thermoelectrics
[SERI/TR-35-078-VOL-1] N80-20882
PARRAY technical papers presented at scientific and technical meetings
[AD-A077726] N80-21104
Fusion technology development
[DOE/ET-0118/1] N80-21165
Advances in MHD technology
[CONF-790598-5] N80-21166

TECHNOLOGY TRANSFER
The impact of behavioral and technical information interventions on industrial R and D projects
[PB80-110265] N80-21194
Innovations and technology transfer. The role of the European Space Agency, volume 1
[ESA-CR(P)-1219-VOL-1] N80-21212
Innovations and technology transfer. The role of the European Space Agency. Volume 2: Annexes
[ESA-CR-(P)-1219-VOL-2] N80-21213

TECHNOLOGY UTILIZATION
Earth Survey Applications Division: Research leading to the effective use of space technology in applications relating to the Earth's surface and interior
[E80-10084] N80-20722
Earth survey applications division: Research leading to the effective use of space technology in applications relating to the Earth's surface and interior
[E80-10087] N80-20723
NASA/Marshall's lithium battery applications
N80-20825
High energy density battery development status report N80-20826
National solar heating and cooling programs
[PB80-104987] N80-20915
Marketing and market acceptance data from the Residential Solar Demonstration Program. Volume 1: Detailed analysis, autumn 1979
[PB80-115298] N80-21197
Patent policy, part 2
[GPO-58-551] N80-21199

TECTONICS
Geological/geophysical resource assessment --- Rio Grande rift N80-20725
Regional modeling: The Ivrea zone --- Northern Italy N80-20731
Interpretation of geoid anomalies in the vicinity of subduction zones --- Tonga-Kermadec and the New Hebrides island arc, North Fiji, South Fiji and Lau-havre N80-20732
Global geology and geophysics using satellite-derived data N80-20733
Geophisical atlas N80-20734
Comparative planetology/crustal evolution
N80-20735
Crustal deformation: Crustal dynamics project
N80-20736
Investigation of crustal dynamics using VLBI
N80-20737
Plate boundary deformation in California --- Southern California: Elsinore, Earthquake Valley, and San Felipe Faults N80-20739
On the slection of station sites for observing strain steps and earthquake forerunners in California
N80-20740
Geodetic stability of the Green Bank, West Virginia VLBI site N80-20742
Global intra-plate volcanism N80-20744
Crustal motion measurements in California (SAFE)
N80-20746
Mantle convection and subcrustal stress
N80-20752
Information theory density distribution --- Earth Mantle N80-20753
Marine geology and tectonic evolution of the northwestern margin of the California continental borderland N80-20959

TELECOMMUNICATION
On correlation parameters for some binary sequences of lengths 31 and 63 for spread-spectrum multiple-access communications
[AD-A077152] N80-20464

Experimental Image Compression Subsystem (EICS) communication testing
[AD-A077546] N80-20470
European scientific notes, volume 33, number 11
[AD-A079711] N80-21241

TELEMETRY
Minicomputer controlled system for testing telemetry receiving and recording systems
[AD-A078803] N80-20305

TELEVISION RECEIVERS
Characterization of electrical ignition sources within television receivers
[PB80-103450] N80-20477

TELEVISION SYSTEMS
A direct measure of CRT image quality
[AD-A075810] N80-21146

TEMPERATURE DISTRIBUTION
Laboratory study of thermal and flow structures in heated and/or cooled layers of water N80-20518
Distribution of steady state temperatures and thermoelastic stresses in cylindrical shell with internal heat generation and cooled on both sides or only on one side
[GA-A-15509] N80-20634
Thermal anisotropy of vegetation canopies --- Phoenix, Arizona N80-20773
Estimating nocturnal surface temperature in Florida using thermal data from geostationary satellite data N80-20982

TEMPERATURE EFFECTS
Large-strain deformation of a mild steel at intermediate temperatures N80-20369
Effect of heat treatment on fracture of type 304L stainless steel in a hydrogen environment
[DP-MS-79-18] N80-20384
Laboratory study of flow and thermal structures in heated and/or cooled layers of water
[PB80-120694] N80-20556
Study of Raman linewidths as a function of structure, bonding and temperature N80-21171

TEMPERATURE PROFILES
Assessment of low- to moderate-temperature geothermal resources of Nevada
[NVO-01556-1] N80-20792

TENNESSEE
Crustal structure and dynamics of southeastern US --- Maryland, Virginia, North Carolina, South Carolina, West Virginia, Georgia, Tennessee, and Kentucky N80-20738

TENSILE PROPERTIES
Large-strain deformation of a mild steel at intermediate temperatures N80-20369

TENSILE STRESS
Global intra-plate volcanism N80-20744

TERMINAL BALLISTICS
The particle dynamics of target penetration
[AD-A077114] N80-20592

TERRAIN
Airborne electronic terrain map system: A literature review
[AD-A079402] N80-20255
A digital terrain model for large surfaces and direct storage access N80-20681
Improvement in classification accuracy of LANDSAT MSS data in areas of mountainous terrain N80-20766

TERRAIN ANALYSIS
Computer modeling of terrain effects on Instrument Landing System (ILS) glide slope systems
[AD-A078228] N80-20252
Geomorphology of Martian valleys N80-21232

TEST EQUIPMENT
Light-duty diesel gaseous emissions measurement - comparison of dilution tunnel test results to certification cell test results
[PB80-115991] N80-20945

TEXAS
Geological/geophysical resource assessment --- Rio Grande rift N80-20725
NASA-census Application Pilot Test (APT) and urban area delineation studies --- Seattle, Washington; Austin, Texas; Orlando, Florida; Boston, Massachusetts, and Richmond, Virginia N80-20765
Evaluation of a spectral method for percentage green determination using clipped rangeland forage samples --- Texas N80-20781
The economic effects of weather modification activities. Part 2: Range production and interindustry analysis
[PB80-112055] N80-21006

TEXTURES
Texture primitive extraction using an edge-based approach
[AD-A078085] N80-21051

THEMATIC MAPPING
The topographic synoptic map 1:200,000 N80-20661
Obtaining surface information for topography and town and country planning from remote sensing N80-20668
ADP-supported color separation N80-20684
Computer-assisted thematic mapping for federal planning N80-20686
Digitizing of geometic data for thematic mapping: State-of-the-art and future developments N80-20687
Application of LANDSAT imagery to monitor sand dunes movement in the Sahara Desert N80-20719
Remote monitoring of forest cover conditions --- deciduous tree defoliation in Pennsylvania N80-20763
Monitoring drought in Colorado with LANDSAT MSS N80-20770
Radiometric resolution for monitoring vegetation: How many bits are needed? N80-20777
Thematic mapper versus multispectral scanner for crop monitoring N80-20778
LANDSAT-D assessment system N80-20782

THEORETICAL PHYSICS
Research program in theoretical high-energy physics
[COO-3130TA-347] N80-21137

THERMAL CONDUCTIVITY
Low temperature thermal conductivities of glassy carbons
[COO-1198-1280] N80-20323
Thermal conductivity of liquid carboxylic acids
[ESDU-79029] N80-20328
Technique for measuring the apparent thermal conductivity of flat insulation
[ORNL/TM-6494] N80-20549

THERMAL CONTROL COATINGS
An experimental, low-cost, silicon-aluminide high-temperature coating for superalloys
[NASA-TM-81455] N80-20370

THERMAL ENERGY
Thermal fluid selection for long-distance heat transmission
[CONF-790803-47] N80-20879
Thermal energy storage application areas --- for building heating and cooling
[CONS/5113-T4] N80-20894
Environmental development plan for space applications --- development of nuclear power supplies for use in space
[DOE/EDP-0057] N80-20922

THERMAL INSULATION
Technique for measuring the apparent thermal conductivity of flat insulation
[ORNL/TM-6494] N80-20549

THERMAL MAPPING
Heat Capacity Mapping Mission (HCMM) --- australia
[E80-10066] N80-20721
Thermal anisotropy of vegetation canopies --- Phoenix, Arizona N80-20773

THERMAL PROTECTION
Structural tests on a tile/strain isolation pad thermal protection system --- space shuttles
[NASA-TM-80226] N80-20302
Nonlinear static TPS analysis
[NASA-TM-81785] N80-20620

THERMAL STABILITY
Stability of self-similar flow: Uniform implosion of an ablatively driven shell
[AD-A079890] N80-20540
High temperaturs storage characteristics of lithium sulfur dioxide cells N80-20835

THERMAL STRESSES
Thermo-elastic-plastic stresses in hollow cylinders due to quenching
[AD-A077109] N80-20622
Distribution of steady state temperatures and thermoelastic stresses in cylindrical shell with internal heat generation and cooled on both sides or only on one side
[GA-A-15509] N80-20634

THERMIONIC CONVERTERS
DOE/JPL advanced thermionic technology program
[COO-3056-37] N80-20873

THERMIONIC POWER GENERATION
DOE/JPL advanced thermionic technology program
[COO-3056-37] N80-20873

THERMISTORS
Thermistor array impedance considerations
[AD-A079886] N80-20492

THERMODYNAMIC PROPERTIES
Thermal response and reusability tests of advanced flexible Reusable Surface insulation (RSI) and ceramic title RSI samples at surface temperatures to 1200 degrees F
[AD-A077887] N80-20399
Laboratory study of thermal and flow structures in heated and/or cooled layers of water N80-20518
Fluid and thermodynamic characteristics of compressible recoil
[AD-A078587] N80-20548
Laboratory study of flow and thermal structures in heated and/or cooled layers of water
[PB80-120694] N80-20556
Determination of basalt physical and thermal properties at varying temperatures, pressures, and moisture contents
[RHO-BWI-C-55] N80-20971
Determination of basalt physical and thermal properties at varying temperatures, pressures, and moisture contents
[RHO-BWI-C-54] N80-20972
Temperatures generated by underground storage of defense waste canisters
[DP-MS-79-37] N80-21135

THERMODYNAMICS
Thermodynamics of organic compounds --- ramjet fuels
[AD-A080072] N80-20410
Basic research in engineering: Fluid dynamics and thermal processes --- workshop
[FE-2468-54] N80-20551

THERMOELASTICITY
Thermo-elastic-plastic stresses in hollow cylinders due to quenching
[AD-A077109] N80-20622

THERMOELECTRIC GENERATORS
Conversion system overview assessment. Volume 1: Solar thermoelectrics
[SERI/TR-35-078-VOL-1] N80-20882

THERMOELECTRIC POWER GENERATION
Milatarized thermoelectric power sources
[AD-A075609] N80-20869
Environmental assessment methodology: Solar power plant applications. Volume 3. Environmental impact assessment application
[EPRI-ER-1070-VOL-3] N80-20889
Evaluation of a sulfur oxide chemical heat storage process for a steam solar electric plant
[LBL-7868-REV] N80-20890

THERMOMETERS
Evaluation of some cryogenic sensors and instrumentations for a large superconducting MHD magnet
[CONF-790815-30] N80-20568

THERMOPHYSICAL PROPERTIES
Normal butane: Provisional thermodynamic functions from 135 to 700 K at pressures to 700 bar
[PB80-118193] N80-20365
Experimental laboratory measurement of thermophysical properties of selected coal types
[NASA-CR-162913] N80-20404

THICK FILMS
Microstructural studies of thick film resistors using transmission electron microscopy
[SAND-79-0387C] N80-20508

THICK WALLS
Development of automated welding processes for field fabrication of thick-walled pressure vessels: Electron beam method
[FE-2606-T1] N80-20597

THICKENERS (EQUIPMENT)
Chemical primary sludge thickening and dewatering
[PB80-108970] N80-21222

THICKNESS
Experimental study of cap and thickness influence on the vibration response and damping of flexible fluid-coupled coaxial cylinders
[CONF-790615-14] N80-20633
THIN FILMS
Production of thin film networks which utilize chrome-gold conductors
[BDX-613-2257] N80-20503
Low cost thin film polycrystalline silicon solar cells
[DOE/ET-23048/1] N80-20906
THIN PLATES
Vibration of plates of various geometries
N80-20613
THREE DIMENSIONAL FLOW
The development of rapid predictive methods for three-dimensional transonic flow fields about fighter bomber aircraft, part 1
[AD-A078683] N80-20236
Computation of three-dimensional aerodynamic flow
[AD-A080073] N80-20240
Evolution of turbulence by three-dimensional numerical particle-vortex tracing N80-20523
Determination of streamline geometry and equivalent radius over arbitrary bodies with application to three-dimensional drag problem
[AD-A077878] N80-20535
Three-dimensional laminar solution of the Navier-Stokes equations using body-filtered coordinate systems, part 2
[AD-A080046] N80-20543
THRUST AUGMENTATION
Effect of water injection and off scheduling of variable inlet guide vanes, gas generator speed and power turbine nozzle angle on the performance of an automotive gas turbine engine
[NASA-TM-81415] N80-20272
An experimental study of static thrust augmentation using a 2-d variable ejector
[AD-A079857] N80-20279
Beamed energy coupling studies
[AD-A080037] N80-20578
THYRISTORS
Measurement techniques for high power semiconductor materials and devices
[DOE/RA-0041] N80-20506
TIDAL FLATS
The production of photomaps from tidal flat areas
N80-20682
TIDES
The production of photomaps from tidal flat areas
N80-20682
TILES
Structural tests on a tile/strain isolation pad thermal protection system --- space shuttles
[NASA-TM-80226] N80-20302
TIMBER VIGOR
Remote monitoring of forest cover conditions --- deciduous tree defoliation in Pennsylvania
N80-20763
TIME DEPENDENCE
Time resolved spectroscopy using synchrotron radiation
[LBL-9475] N80-20354
Substorm-related VLF chorus events: Local-time dependence and relationship to newly-injected clouds of drifting energetic electrons N80-20450
Time-dependent inelastic analysis by the boundary element method and the finite element method
N80-20616
Determination of variations of time dependent coordinates through astronomical and Doppler observations N80-20649
TIME DIVISION MULTIPLE ACCESS
A note on almost noiseless channels
[AD-A077588] N80-20473
TIME MEASUREMENT
Elaboration of the time system of the satellite observation station Wettzell from 1972-1977
N80-20645
TIME OPTIMAL CONTROL
A singular perturbation analysis of minimum time long range intercept
[NASA-CR-162895] N80-20261
TIMING DEVICES
Elaboration of the time system of the satellite observation station Wettzell from 1972-1977
N80-20645
TIRES
NDT (Non-Destructive Test)/road correlation
[PB80-106636] N80-20607
TISSUES (BIOLOGY)
Absorption characteristics of prolate spheroidal model of man and animals at and near resonance frequency
[PB80 108293] N80-21028
Formulation of a preliminary assessment of halogenated organic compounds in man and environmental media
[PB80-112170] N80-21029
TITAN
Outer satellite atmospheres: Their extended nature and planetary interactions --- sodium cloud of Io, hydrogen torus of Titan, and comet atmospheres
[NASA-CR-162902] N80-21235
TITANIUM
Nickel contaminated titanium weld wire study
[LTR-141-93] N80-20381
TITANIUM ALLOYS
Corrosion resistance of zinc-level plated U-0.75 Ti
[AD-A075539] N80-20373
A fundamental approach to adhesion: Synthesis, surface analysis, thermodynamics and mechanics --- acid-base properties of titanium 6-4 surfaces
[NASA-CR-162903] N80-20397
TITANIUM COMPOUNDS
Characterization of prototype secondary lithium battery N80-20832
TITANIUM OXIDES
Models for the photoelectrolytic decomposition of water at semiconducting oxide anodes
[AD-A079469] N80-20343
TOKAMAK DEVICES
High power ion-irradiation test for CTR first wall --- using a plasma anode
[IPPJ-437] N80-21158
Vacuum ultraviolet spectroscopic study of plasma impurities in the Tokapole 2 poloidal divertor experiment
[COO-2387-111] N80-21162
Velocity space instabilities of alpha particles in Tokamak reactors --- plasma frequency instabilities due to hollow isotropic alpha velocity distributions
[DOE/TIC-11016] N80-21167
TOOLS
Computer circuit card puller
[NASA-CASE-FRC-11042-1] N80-20589
TOPOGRAPHY
Orthophoto techniques and photomaps
N80-20666
Obtaining surface information for topography and town and country planning from remote sensing
N80-20668
Reports on cartography and topographical measurements. Series 1: Original report no. 74
[REPT-74] N80-20674
Reports on cartography and topographical measurements. Series 2: Translations --- computer assisted data correlation
[REPT-35] N80-20679
A program for the fully automated displacement of point and line features in cartographic generalization
N80-20680
Earth Survey Applications Division: Research leading to the effective use of space technology in applications relating to the Earth's surface and interior
[E80-10084] N80-20722
Earth survey applications division: Research leading to the effective use of space technology in applications relating to the Earth's surface and interior
[E80-10087] N80-20723
Gravity model development N80-20748
The effect of sea state on altimeter measurements
N80-20759
Mean sea surface computation using GEOS-3 altimeter data N80-20760
Ocean circulation N80-20761
Improvement in classification accuracy of LANDSAT MSS data in areas of mountainous terrain
N80-20766
Sequins and quills: Representations for surfaces topography
[AD-A078068] N80-21097
TOPOLOGY
Results on supercompact cardinals N80-21057
Sequins and quills: Representations for surfaces topography
[AD-A078068] N80-21097
TOROIDAL PLASMAS
Divertor experiments in a toroidal plasma, with ExB drift due to an applied radial electric field
N80-21151
Formation of toroidal plasma confinement configuratons by using hot electrons
[UCID-18239] N80-21161
TORQUE
A recursive Lagrangian formulation of manipulator dynamics and a comparative study of dynamics formulation complexity
[AD-A078067] N80-21062
TORSION
Web distortion and flexural-torsional buckling
[PB80-116221] N80-20444
TOWERS
An investigation of rib stiffened hyperbolic cooling tower under statical loads using discrete field and Galerkin finite element methods N80-20617
Comprehensive study of drift from mechanical draft cooling towers
[PNL-3083] N80-20928
TRACE ELEMENTS
Trace and minor element analyses of coal liquefaction products
[PETC/TR-79/3] N80-20417
Trace characterization of metals in solid samples and air pollutants N80-20918
Strontium isotopic and trace element geochemistry of the Saddle Mountains and Grande Ronde Basalts of the Columbia River Basalt group N80-20958
TRACKING STATIONS
Elaboration of the time system of the satellite observation station Wettzell from 1972-1977
N80-20645
Participation of satellite observation station Wetzell in international observation programs, 1975-1977
N80-20646
TRAFFIC
X-ray diffraction analysis of selected paint pigments --- traffic paints
[PB80-113061] N80-20401
TRAJECTORY ANALYSIS
Determination of the minimum delta 5 transfer trajectory from a low Earth orbit to a stable orbit around the Lagrangian point L4 in a restricted four-body system
[AD-A079881] N80-20295
TRAJECTORY CONTROL
A singular perturbation analysis of minimum time long range intercept
[NASA-CR-162895] N80-20261
TRAJECTORY OPTIMIZATION
A singular perturbation analysis of minimum time long range intercept
[NASA-CR-162895] N80-20261
TRANSFER ORBITS
Determination of the minimum delta 5 transfer trajectory from a low Earth orbit to a stable orbit around the Lagrangian point L4 in a restricted four-body system
[AD-A079881] N80-20295
Technology requirements for future Earth-to-geosynchronous orbit transportation systems. Volume 3: Appendices
[NASA-CR-159174] N80-20303
TRANSIENT RESPONSE
Calculation of the singularity expansion method parameters from the transient response of a thin wire
[AD-A078852] N80-20457
Transient response of a heterodyne receiver: Implications for a time-of-arrival system
[AD-A078373] N80-20469
Transient response optimization of piezoelectric disc transducers by time domain techniques --- demonstrating design procedures for reducing mechanical ringing N80-20561
TRANSISTOR AMPLIFIERS
Solid-state amplifiers and image converters
[BLL-RTS-11799] N80-20480
TRANSISTORS
Lump partitioning of integrated-circuit bipolar transistor models for high-frequency applications
N80-20482

TRANSIT SATELLITES
Long-period terms in the neutral density of the upper atmosphere
[PB80-119464] N80-20978
TRANSITION METALS
Molecular orbital criteria for reductive elimination from organotransition-metal complexes
[AD-A079447] N80-20344
Energy of 100 coincidence twist boundaries in transition metal oxides
[CONF-7907101-2] N80-21179
TRANSMISSION LINES
Thermistor array impedance considerations
[AD-A079886] N80-20492
Superconducting fault current limiter
[CONS/3015-T1] N80-20507
TRANSONIC FLOW
The development of rapid predictive methods for three-dimensional transonic flow fields about fighter bomber aircraft, part 1
[AD-A078683] N80-20236
A numerical study of normal-shock/turbulent boundary layer interactions
[AD-A079858] N80-20537
TRANSONIC SPEED
Transonic unsteady airloads on an energy efficient transport wing with oscillating control surfaces
[NASA-TM-81788] N80-20228
TRANSPORT PROPERTIES
Synthesis, characterization, and properties of isoprene-methyl methacrylate copolymers
N80-20395
Transport properties in the atmosphere of Jupiter
[NASA-CR-162897] N80-21234
TRANSPORTATION ENERGY
Projections of direct energy consumption by mode: The 1975 - 2000 baseline
[ANL/CNSV-4] N80-20878
Urban mass transportation energy conservation: SRGP operating instructions and program documentation, volume 5
[DOE/PE/8628-1-VOL-5] N80-21205
Urban transportation energy conservation: Case city applications of analysis methodologies, volume 3
[DOE/PE/8628-1-VOL-3] N80-21206
Urban transportation energy conservation: Analytic procedures for estimating changes in travel demand and fuel consumption, volume 2
[DOE/PE/8628-1-VOL-2] N80-21207
Mechanical energy storage technology for transportation applications project plan
[UCRL-15138] N80-21209
Energy storage systems for automobile propulsion
[UCID-18320] N80-21211
TRAPPING
Laser induced fluorescence of trapped molecular ions
[LBL-10021] N80-21114
TRAVELING SALESMAN PROBLEM
Local search for the asymmetric traveling salesman problem
[PB80-118532] N80-21096
TRAVELING WAVE TUBES
High power millimeter wave amplifier --- results of tests on traveling wave tubes
[AD-A078007] N80-20491
TREES (MATHEMATICS)
Results on supercompact cardinals N80-21057
TRIANGULATION
The triangulation network in West Germany
N80-20651
TRIBOLOGY
Surface temperatures and glassy state investigations in tribology, part 3 --- limiting shear stress rheological model
[NASA-CR-3272] N80-20588
TRINITROTOLUENE
TNT equivalency of benite propellant --- to determine overpressure for propellant storage
[AD-A077108] N80-20406
TROPICAL REGIONS
Summer circulation over South America from satellite data N80-20983
TROPOSPHERE
Summer circulation over South America from satellite data N80-20983
Day-night differences in radiosonde observations of the stratosphere and troposphere
[PB80-117989] N80-20995
TROPOSPHERIC SCATTERING
Tropospheric scatter communications. A bibliography with abstracts
[NTIS/PS-79/0750/4] N80-20478
TRUSSES
Space truss design: The polyhedral chain group
N80-20434
TURBINES
A calculating technique for the flow field around a hydraulic turbine --- panel method
[ILR-37] N80-20553
Darrieus vertical axis wind turbine program overview
[SAND-79-2146C] N80-20891
TURBOCOMPRESSORS
Aerodynamics of advanced axial-flow turbomachinery
[AD-A079617] N80-20277
TURBOMACHINERY
Cavitation induced instabilities associated with turbomachines N80-20519
TURBULENCE
Velocity profiles in a long inlet duct employing a photon correlating laser velocimeter without seeding
[AD-A079878] N80-20278
Evolution of turbulence by three-dimensional numerical particle-vortex tracing N80-20523
TURBULENT BOUNDARY LAYER
A numerical study of normal-shock/turbulent boundary layer interactions
[AD-A079858] N80-20537
A calibration of the Preston tube in liquid flow systems
[AD-A079876] N80-20538
TURBULENT DIFFUSION
The structure of eddies in turbulent flames, volume 1
[AD-A078625] N80-20341
TURBULENT FLOW
Detection of the transitional layer between laminar and turbulent flow areas on a wing surface --- using an accelerometer to measure pressure levels during wind tunnel tests
[NASA-CASE-LAR-12261-1] N80-20224
Development of combustion diagnostics and applications to turbulent combustion
[AD-A079523] N80-20348
Progress in turbulence modeling for complex flow fields including effects of compressibility
[NASA-TP-1517] N80-20527
Hot wire anemometer investigation of turbulence levels and development of liquid crystal flow visualization techniques for the rectilinear cascade test facility
[AD-A078284] N80-20533
Turbulence and statistical mechanics
[AD-A079757] N80-20536
Nonlinear wave process hierarchies and the cyclic development of quasi-ordered structures in turbulent shear flows
[AD-A079619] N80-20545
Transition to turbulence in free shear-layers
[AD-A080066] N80-20547
Studies of the statistical bias and signal characteristics of laser velocimeters
[AD-A079634] N80-20579
TURNING FLIGHT
Use of an aerodynamic turn to maximize the orbit inclination change for the space shuttle orbiter
[AD-A079855] N80-20291
TWO BODY PROBLEM
Orbital estimation using two-body classical orbital elements as measurement updates
[AD-A079903] N80-20290
TWO DIMENSIONAL FLOW
Numerical solution of the two-dimensional incompressible averaged Navier-Stokes equations for finite arbitrary shaped isolated bodies, part 1
[AD-A080093] N80-20544
TYPHOONS
Mariners weather log
[PB80-113277] N80-20994

U

U.S.S.R.
A test of the climatic normality of synthetic profiles of atmospheric liquid water content over the USSR in 1973
[AD-A077021] N80-20990
Proceedings of USSR-Japan Joint Seminar on Plasma Diagnostics
[IPPJ-438] N80-21154
ULCERS
Reduction of the duration of restraint for the production of experimental ulcers in rats: Application to the study of protective substances
[NASA-TM-76136] N80-21016
ULTRAPURE METALS
Influence of purity level on the mechanical properties of hot isostatically pressed beryllium
[SAND-79-8232] N80-20377
ULTRASONIC RADIATION
The dynamics of an ultrasonic cavitation bubble
N80-20520
Random signal flaw detection
[AD-A078443] N80-21103
ULTRASONIC TESTS
Digital waveform recording and computer analysis of acoustic emission and ultrasonic transients detected by optical and piezoelectric probes N80-20558
ULTRASONIC WAVE TRANSDUCERS
CDS solid state phase insensitive ultrasonic transducer --- annealing dadmium sulfide crystals
[NASA-CASE-LAR-12304-1] N80-20559
ULTRASONICS
NDT (Non-Destructive Test)/road correlation
[PB80-106636] N80-20607
ULTRAVIOLET ASTRONOMY
Analysis of time dependent phenomena observed with the LPSP OSO-8 instrument --- solar chromosphere and photosphere
[NASA-CR-162908] N80-21237
ULTRAVIOLET RADIATION
ISS/SIMS characterization of UV/O sub 3 cleaned surfaces
[AD-A078425] N80-20375
Ozone and ultraviolet radiation disinfection for small community water systems
[PB80-108418] N80-21220
ULTRAVIOLET SPECTROSCOPY
Vacuum ultraviolet spectroscopic study of plasma impurities in the Tokapole 2 poloidal divertor experiment
[COO-2387-111] N80-21162
UNDERGROUND STORAGE
Determination of basalt physical and thermal properties at varying temperatures, pressures, and moisture contents
[RHO-BWI-C-55] N80-20971
Determination of basalt physical and thermal properties at varying temperatures, pressures, and moisture contents
[RHO-BWI-C-54] N80-20972
Nevada nuclear waste storage investigations
[NVO-196-11] N80-21129
Temperatures generated by underground storage of defense waste canisters
[DP-MS-79-37] N80-21135
UNDERWATER ACOUSTICS
PARRAY technical papers presented at scientific and technical meetings
[AD-A077726] N80-21104
UNITED KINGDOM
Studies of water, 1978-1979 N80-20931
UNITED STATES OF AMERICA
Crustal deformation: Crustal dynamics project
N80-20736
Crustal structure and dynamics of southeastern US --- Maryland, Virginia, North Carolina, South Carolina, West Virginia, Georgia, Tennessee, and Kentucky
N80-20738
Mantle convection and subcrustal stress
N80-20752
Major uses of land in the United States, 1974
[PB80-114226] N80-20796
Industrial Sector Technology Use Model (ISTUM): Industrial energy use in the United States, 1974 - 2000. Volume 2: Results
[DOE/FE-2344/2] N80-20885

Meteorological criteria for standard project hurricane and probable maximum hurricane windfields, gulf and east coasts of the United States
[PB80-117997] N80-20999
National winter storms operations plan
[PB80-118425] N80-21000
Priority R and D needs of urban America, resource document
[PB80-106164] N80-21215

UNIVERSAL TIME
Polar motion and Earth rotation results from Lageos N80-20757

UPPER ATMOSPHERE
Long-period terms in the neutral density of the upper atmosphere
[PB80-119464] N80-20978
The 19304D GSRS, missile number 1046, round number V-66, 23 August 1979
[AD-A079969] N80-20988

URBAN DEVELOPMENT
International symposium on urban hydrology: Proceedings of two special sessions, spring annual meeting, American Geophysical Union
[PB80-123078] N80-20805
Urbanization and water quality planning: The 208 experience in Massachusetts
[PB80-106743] N80-21214

URBAN PLANNING
Analytical procedures for urban transportation energy conservation: Summary of findings and methodologies, volume 1
[DOE/PE/8628-1-VOL-1] N80-21208
Challenges in urban runoff control (planning, implementation and simulation)
[PB80-107873] N80-21221

URBAN RESEARCH
NASA-census Application Pilot Test (APT) and urban area delineation studies --- Seattle, Washington; Austin, Texas; Orlando, Florida; Boston, Massachusetts, and Richmond, Virginia N80-20765
Priority R and D needs of urban America, resource document
[PB80-106164] N80-21215

URBAN TRANSPORTATION
AMTV headway sensor and safety design
[NASA-CR-162717] N80-21203
Urban mass transportation energy conservation: SRGP operating instructions and program documentation, volume 5
[DOE/PE/8628-1-VOL-5] N80-21205
Urban transportation energy conservation: Case city applications of analysis methodologies, volume 3
[DOE/PE/8628-1-VOL-3] N80-21206
Urban transportation energy conservation: Analytic procedures for estimating changes in travel demand and fuel consumption, volume 2
[DOE/PE/8628-1-VOL-2] N80-21207
Analytical procedures for urban transportation energy conservation: Summary of findings and methodologies, volume 1
[DOE/PE/8628-1-VOL-1] N80-21208

USER MANUALS (COMPUTER PROGRAMS)
User's guide for numerical modeling of buoyant plumes in a turbulent, stratified atmosphere
[PB80-114549] N80-20946
Computer manual for calculating wave-height distributions about offshore structures
[PB80-109150] N80-21013
ISIS users manual
[NASA-TM-80144] N80-21043
Syndia users guide
[AD-A075538] N80-21047

UTAH
Energy source book --- Colorado, Montana, North Dakota, South Dakota, Utah, and Wyoming
[DOE/TIC-10190] N80-20895

V

VACUUM APPARATUS
Determining the mode of high voltage breakdowns in vacuum devices
[GEPP-OP-469] N80-20504

VACUUM CHAMBERS
Atomic hydrogen storage --- cryotrapping and magnetic field strength
[NASA-CASE-LEW-12081-2] N80-20402

VACUUM SPECTROSCOPY
Vacuum ultraviolet spectroscopic study of plasma impurities in the Tokapole 2 poloidal divertor experiment
[COO-2387-111] N80-21162

VALENCE
Ground states and magnetic responses of model valence-fluctuation systems
[LA-UR-79-3144] N80-21176

VALLEYS
Plate boundary deformation in California --- Southern California: Elsinore, Earthquake Valley, and San Felipe Faults N80-20739
Geomorphology of Martian valleys N80-21232

VAPOR DEPOSITION
Calculation of residual principal stresses in CVD boron on carbon filaments
[NASA-TM-81456] N80-20314
Processing research on chemically vapor deposited silicon nitride --- for electromagnetic windows in chemical reactors
[AD-A079328] N80-20349
Study program to develop and evaluate die and container materials for the growth of silicon ribbons --- for development of low cost solar cells
[NASA-CR-162899] N80-20818

VAPOR PHASES
Atomic and molecular gas phase spectrometry
[AD-A079657] N80-20350
Time resolved spectroscopy using synchrotron radiation
[LBL-9475] N80-20354
Efficient high energy infrared third harmonic generation in gases and liquids for laser fusion applications --- carbon dioxide lasers
[COO-4251-7] N80-20581

VAPOR PRESSURE
Structural assessment of involutes
[AD-A077875] N80-20318
Vapour pressures and critical points of liquids. 14: Aliphatic oxygen-nitrogen compounds
[ESDU-79030] N80-20329
Vapor pressure and melting behavior of sulfuric acid-water systems
[PB80-116007] N80-20363
Method and apparatus for convection control of metallic halide vapor density in a metallic halide laser
[NASA-CASE-NPO-15021-1] N80-20574

VARIATIONAL PRINCIPLES
Analysis of the consolidation of layered soils using the method of lines
[PB80-112766] N80-20447
Some new mathematical methods for variational objective analysis using splines and cross validation
[AD-A079302] N80-21067

VASCULAR SYSTEM
Coagulating activity of the blood, vascular wall, and myocardium under hypodynamia conditions
[NASA-TM-76056] N80-21023

VECTOR ANALYSIS
A method for examining relationships between multispectral data N80-20708

VEGETATION
Geobotanical exploration --- Mineral, Virginia N80-20724
Surface mine monitoring --- Pennsylvania N80-20764
Improvement in classification accuracy of LANDSAT MSS data in areas of mountainous terrain N80-20766
A spectral method for determining the percentage of green herbage material in clipped samples N80-20780

VEGETATION GROWTH
Thermal anisotropy of vegetation canopies --- Phoenix, Arizona N80-20773
Radiometric resolution for monitoring vegetation: How many bits are needed? N80-20777
Decline of submerged aquatic plants in Chesapeake Bay
[PB80-114747] N80-21009

VELOCITY DISTRIBUTION
Velocity profiles in a long inlet duct employing a photon correlating laser velocimeter without seeding
[AD-A079878] N80-20278
Scale model studies for establishing the flow patterns of a low-speed tunnel
[NASA-CR-159234] N80-20285
Velocity space instabilities of alpha particles in Tokamak reactors --- plasma frequency instabilities due to hollow isotropic alpha velocity distributions
[DOE/TIC-11016] N80-21167

VELOCITY MEASUREMENT
Purely buoyant diffusion flames: Some experimental results
[PB80-112113] N80-20364

VENTILATION FANS
Fluid mechanics, internal flow sub-series. Volume 7: A guide to fan selection and performance
[ESDU-79037] N80-20511

VERTICAL ORIENTATION
Darrieus vertical axis wind turbine program overview
[SAND-79-2146C] N80-20891

VERY LONG BASE INTERFEROMETRY
Investigation of crustal dynamics using VLBI N80-20737

VERY LOW FREQUENCIES
Substorm-related VLF chorus events: Local-time dependence and relationship to newly-injected clouds of drifting energetic electrons N80-20450

VESTIBULAR TESTS
Glycerol test in diagnosing increased intralabyrinth pressure
[NASA-TM-76110] N80-21022

VESTIBULES
Cold shivering activity after unilateral destruction of the vestibular apparatus
[NASA-TM-76099] N80-21021

VIBRATION
Vibration of plates of various geometries N80-20613
The prediction of mass loaded natural frequencies and forced response of complex, rib-stiffened structures
[AD-A079856] N80-20625

VIBRATION DAMPING
Damping of anisotropic composites studied from the properties of the rolled components
[ILR-41] N80-20324
Bias errors in a random vibration extremal control strategy
[SAND-79-1222] N80-20632
Experimental study of cap and thickness influence on the vibration response and damping of flexible fluid-coupled coaxial cylinders
[CONF-790615-14] N80-20633

VIBRATION TESTS
Bias errors in a random vibration extremal control strategy
[SAND-79-1222] N80-20632

VIEW EFFECTS
Off-nadir viewing effects on spectral assessment of green biomass N80-20772

VINYL POLYMERS
Fabrication, characterization and optimization of posfet (PVF2-silicon) piezoelectric transducers for low frequency 100 Hz to 500 KHz underwater acoustic applications
[AD-A079113] N80-20500

VIRGINIA
Geobotanical exploration --- Mineral, Virginia N80-20724
Crustal structure and dynamics of southeastern US --- Maryland, Virginia, North Carolina, South Carolina, West Virginia, Georgia, Tennessee, and Kentucky N80-20738
NASA-census Application Pilot Test (APT) and urban area delineation studies --- Seattle, Washington; Austin, Texas; Orlando, Florida; Boston, Massachusetts, and Richmond, Virginia N80-20765
Sources of variations in LANDSAT autocorrelation --- Richmond, Virginia and Denver, Colorado N80-20767

VISCOELASTICITY
Dynamic Green's functions for layered media and applications to boundary-value problems --- for earthquake engineering in viscoelastic media N80-20431

VISCOPLASTICITY
On the theory of cyclic viscoplasticity --- stress-strain response N80-20608

VISCOUS FLUIDS
Dynamics of flexible rotors partially filled with a viscous incompressible fluid N80-20513

VISIBILITY
Inferred climatology for U.S. airports
[AD-A080487] N80-20987

VISUAL DISCRIMINATION
Directional selectivity and its use in early visual processing — construction of directionally selective units and their use in processing visual motion
[AD-A078054] N80-21144
VISUAL PERCEPTION
Distance estimation from cognitive maps
[AD-A063098] N80-20788
Directional selectivity and its use in early visual processing — construction of directionally selective units and their use in processing visual motion
[AD-A078054] N80-21144
VLASOV EQUATIONS
Stability analysis of cylindrical Vlasov equilibria N80-21152
VOICE COMMUNICATION
Satellite personal communications system
[NASA-CASE-NPO-14480-1] N80-20448
Speech bandwidth reduction
[PB80-103955] N80-20479
VOICE DATA PROCESSING
Memory-based frame synchronizer — for voice data processing in digital communication systems
[NASA-CASE-GSC-12430-1] N80-20453
Noise suppression methods for robust speech processing
[AD-A079321] N80-20486
VOLCANOES
Comparative planetology/crustal evolution N80-20735
VOLCANOLOGY
Geological/geophysical resource assessment — Rio Grande rift N80-20725
Global geology and geophysics using satellite-derived data N80-20733
Geophisical atlas N80-20734
Global intra-plate volcanism N80-20744
Development of A seismic data collection platform N80-20745
Hotspots and the evolution of the mantle
[NASA-CR-162906] N80-20964
VOLT-AMPERE CHARACTERISTICS
Theory and applications of negative differential resistance in the current-voltage characteristics of metal-insulator-metal diodes N80-20484
VOLTAGE CONVERTERS (DC TO DC)
The application of DC-DC energy conversion in a solar energy system
[AD-A077112] N80-20867
VOLTAGE REGULATORS
The application of DC-DC energy conversion in a solar energy system
[AD-A077112] N80-20867
VOLUMETRIC ANALYSIS
The development of an electrochemical method for the determination of the effective volume of charged polymers in solution and its application to continuing studies of metal ion binding polyelectrolytes N80-20332
VORTEX RINGS
Kinematics and dynamics of vortex rings in a tube N80-20524
Theoretical study of steady vortex rings in the case of variable partitioning of the force
[MPIS-29/1978] N80-20554
VORTICES
Evolution of turbulence by three-dimensional numerical particle-vortex tracing N80-20523
VORTICITY
On the nature of the apparent response of vorticity area index to the solar magnetic field
[NASA-CR-162915] N80-21239
VULNERABILITY
The vulnerability of commercial aircraft avionics to carbon fibers
[NASA-CR-159213] N80-20317

W

WAFERS
Phase 2: Array automated assembly task low cost silicon solar array project
[NASA-CR-162912] N80-20817
WAKES
Wake flowfields for Jovian probe
[NASA-CR-159235] N80-20230
WALL FLOW
Kinematics and dynamics of vortex rings in a tube N80-20524
WALLS
High power ion-irradiation test for CTR first wall — using a plasma anode
[IPPJ-437] N80-21158
WARNING SYSTEMS
Hydraulic diagnostic monitoring system
[AD-A077552] N80-20584
WASHINGTON
NASA-census Application Pilot Test (APT) and urban area delineation studies — Seattle, Washington; Austin, Texas; Orlando, Florida; Boston, Massachusetts, and Richmond, Virginia N80-20785
WASTE DISPOSAL
Assessment of the impact of resource recovery on the environment
[PB80-102874] N80-20948
Remote experimental facility to solidify SRP high-level waste
[DP-MS-79-53] N80-21128
Research and development activities: High-Level Waste Immobilization Program
[PNL-2999-PT-1] N80-21130
Waste isolation safety assessment program. A brief description of the three-dimensional finite element ground-water flow model adapted for waste isolation safety assessments
[PNL-2652] N80-21131
Sensitivity on the parameters of the regional hydrology model for the Nevada nuclear waste storage investigations
[SAND-79-1197C] N80-21132
Operational Radioactive Waste Management Plan for the Nevada test site
[NVO-185-REV-1] N80-21134
WASTE ENERGY UTILIZATION
Energy conservation in the US: Some interdisciplinary approaches with an emphasis on industrial cogeneration N80-20811
Thermal energy storage application areas — for building heating and cooling
[CONS/5113-T4] N80-20894
WASTE TREATMENT
Production of methane using an anaerobic filter
[ANL-TRANS-1164] N80-20426
Biodegradation and treatability of specific pollutants
[PB80-106438] N80-20932
Development of a biological simulation monitor for joint municipal/industrial treatment systems
[PB80-111032] N80-20951
Evaluation of dewatering devices for producing high-solids sludge cake
[PB80-111503] N80-21216
Chemical primary sludge thickening and dewatering
[PB80-108970] N80-21222
WASTE UTILIZATION
Technical options for conservation of metals: Case studies of selected metals and products
[PB80-102619] N80-20393
Research and development activities: High-Level Waste Immobilization Program
[PNL-2999-PT-1] N80-21130
WASTE WATER
Biodegradation and treatability of specific pollutants
[PB80-106438] N80-20932
Evaluation of dewatering devices for producing high-solids sludge cake
[PB80-111503] N80-21216
Treatment of organic chemical manufacturing wastewater for reuse
[PB80-105166] N80-21217
Chemical primary sludge thickening and dewatering
[PB80-108970] N80-21222
WATER
Models for the photoelectrolytic decomposition of water at semiconducting oxide anodes
[AD-A079469] N80-20343
Direct observation of the reactions of the atom O(1D) with halogen compounds of methane and with methane and water
[MPIS-25/1978] N80-21125
WATER CIRCULATION
Gravity model development N80-20748
WATER FLOW
Laboratory study of flow and thermal structures in heated and/or cooled layers of water
[PB80-120694] N80-20556
Waste isolation safety assessment program. A brief description of the three-dimensional finite element ground-water flow model adapted for waste isolation safety assessments
[PNL-2652] N80-21131
WATER INJECTION
Effect of water injection and off scheduling of variable inlet guide vanes, gas generator speed and power turbine nozzle angle on the performance of an automotive gas turbine engine
[NASA-TM-81415] N80-20272
WATER MANAGEMENT
International symposium on urban hydrology: Proceedings of two special sessions, spring annual meeting, American Geophysical Union
[PB80-123078] N80-20805
Studies of water, 1978-1979 N80-20931
Urbanization and water quality planning: The 208 experience in Massachusetts
[PB80-106743] N80-21214
Challenges in urban runoff control (planning, implementation and simulation)
[PB80-107873] N80-21221
WATER POLLUTION
Biodegradation and treatability of specific pollutants
[PB80-106438] N80-20932
Structure reactivity correlations for environmental reactions
[PB80-110323] N80-20934
Development document for effluent limitations guidelines and new source performance standards for the mineral mining and processing point source category
[PB80-110299] N80-20940
Remote sensing applied to pollution monitoring. Citations from the International Aerospace Abstracts data base
[NTIS/PS-79/0732/2] N80-20952
WATER QUALITY
Public information and lake eutrophication: A case study of Gull Lake in southwestern Michigan
[PB80-113715] N80-20802
Optical detection of fiber particles in water — Lake Superior
[PB80-116866] N80-21148
Urbanization and water quality planning: The 208 experience in Massachusetts
[PB80-106743] N80-21214
Challenges in urban runoff control (planning, implementation and simulation)
[PB80-107873] N80-21221
WATER RECLAMATION
Treatment of organic chemical manufacturing wastewater for reuse
[PB80-105166] N80-21217
WATER RESOURCES
Water resources in arid and semiarid regions. A bibliography with abstracts
[PB80-802259] N80-20795
Analysis of water resources requirement for the enhanced (tertiary) oil recovery in the southern plains region of the United States
[PB80-110869] N80-20801
Functional analysis of the Water Resources Scientific Information Center (WRSIC)
[PB80-111842] N80-20804
Determining the feasibility of incorporating water resource constraints into energy models
[EPRI-EA-1147] N80-20906
Studies of water, 1978-1979 N80-20931
WATER TREATMENT
Treatment of organic chemical manufacturing wastewater for reuse
[PB80-105166] N80-21217
Ozone and ultraviolet radiation disinfection for small community water systems
[PB80-108418] N80-21220
WATER WAVES
Finite-amplitude solitary water waves
[AD-A079718] N80-20546
Wave sensor survey
[PB80-118581] N80-21010
Computer manual for calculating wave-height distributions about offshore structures
[PB80-109150] N80-21013
WATTMETERS
Error analysis in the measurement of average power with application to switching controllers
[NASA-CR-159792] N80-21202

WAVE DIFFRACTION
Nonlinear diffraction theory by an eigenfunction expansion of the Green's function --- for surface gravity wave action on a circular cylinder N80-21058
Diffractoid grating configuration for X-ray and ultraviolet focusing
[NASA-CASE-GSC-12357-1] N80-21140
WAVE FUNCTIONS
Ground states and magnetic responses of model valence-fluctuation systems
[LA-UR-79-3144] N80-21176
WAVE PROPAGATION
An analysis of plastic shock waves in snow
[AD-A080051] N80-20467
Wave propagation in three-dimensional inelastic media
[AD-A080081] N80-20468
Nonlinear wave process hierarchies and the cyclic development of quasi-ordered structures in turbulent shear flows
[AD-A079619] N80-20545
A study of magnetogravity waves N80-20955
A model theory for the fibrous absorber. Part 1: Regular fibre arrangements
[NASA-TM-75800] N80-21101
WAVEFORMS
Speech bandwidth reduction
[PB80-103955] N80-20479
Digital waveform recording and computer analysis of acoustic emission and ultrasonic transients detected by optical and piezoelectric probes N80-20558
WEAPON SYSTEMS
Advanced FIREFLY assessment generalized mechanization requirements report
[AD-A079752] N80-20263
WEATHER
The 19304B GSRS, missile numbers 1139, 1051 and 1037, round numbers V-61, V-62 and V-63, 9 August 1979
[AD-A079994] N80-20989
US Navy and Marine Corps Meteorological station climatic summaries
[AD-A076976] N80-20991
Mariners weather log
[PB80-113277] N80-20994
On the nature of the apparent response of vorticity area index to the solar magnetic field
[NASA-CR-162915] N80-21239
WEATHER FORECASTING
Nowcast and short-range (0-2 hour) forecasts of thunderstorms and severe convective weather for use in air traffic control
[AD-A080426] N80-20247
Inferred climatology for U.S. airports
[AD-A080487] N80-20987
National winter storms operations plan
[PB80-118425] N80-21000
National Weather Service forecasting handbook no. 1: Facsimile products
[PB80-125255] N80-21004
WEATHER MODIFICATION
Economics of weather modification: A review
[PB80-110398] N80-20996
The economic effects of weather modification activities. Part 1: Crop production
[PB80-112048] N80-21005
WEATHER STATIONS
US Navy and Marine Corps Meteorological station climatic summaries
[AD-A076976] N80-20991
WEBS (SUPPORTS)
Web distortion and flexural-torsional buckling
[PB80-116221] N80-20444
WEIBULL DENSITY FUNCTIONS
Properties of isotonic estimators of mean lifetime in a simple prototype development model
[AD-A075578] N80-21091
WELD STRENGTH
Fatigue crack propagation in Hastelloy X weld metal
[ORNL/TM-6999] N80-20388
WEST VIRGINIA
Earth Survey Applications Division: Research leading to the effective use of space technology in applications relating to the Earth's surface and interior
[E80-10084] N80-20722
Crustal structure and dynamics of southeastern US --- Maryland, Virginia, North Carolina, South Carolina, West Virginia, Georgia, Tennessee, and Kentucky N80-20738
Geodetic stability of the Green Bank, West Virginia VLBI site N80-20742
WHEAT
Earth Survey Applications Division: Research leading to the effective use of space technology in applications relating to the Earth's surface and interior
[E80-10084] N80-20722
Effects of wheat irrigation frequency on reflectance in selected spectral bands --- Phoenix, Arizona N80-20771
Off-nadir viewing effects on spectral assessment of green biomass N80-20772
Thermal anisotropy of vegetation canopies --- Phoenix, Arizona N80-20773
Time of day effects on wheat reflectance in fifteen selected bands --- Phoenix, Arizona N80-20774
Radiometric resolution for monitoring vegetation: How many bits are needed? N80-20777
Spectra of isolated vegetational constituents N80-20779
WHITE NOISE
Analysis of first and second order binary quantized digital phase-locked loops for ideal and white Gaussian noise inputs
[NASA-CR-162841] N80-20250
WICKS
Heat pipes: Properties of common small-pore wicks
[ESDU-79013] N80-20512
WIND (METEOROLOGY)
Assessment of environmental wind conditions by wind tunnel model studies --- buildings
[PB80-115926] N80-20445
Meteorological criteria for standard project hurricane and probable maximum hurricane windfields, gulf and east coasts of the United States
[PB80-117997] N80-20999
Development of aerodynamic disturbance test procedures. Volume 2: Technical report
[PB80-118383] N80-21219
WIND MEASUREMENT
Wind characteristics for field testing of wind conversion systems
[SAND-78-1563] N80-20993
WIND PRESSURE
System identification structural dynamics: An application to wind force estimation --- nonlinear dynamic programming filter N80-20435
WIND PROFILES
Wind characteristics for field testing of wind conversion systems
[SAND-78-1563] N80-20993
WIND SHEAR
Airborne aids for coping with low-level wind shear. All-weather landing systems, engineering services support project, task 2 --- the use of aircraft instruments, flight simulation techniques, and mathematical models to understand wind shear effects during aircraft approach and takeoff
[AD-A080589] N80-20242
Development of wind shear models and determination of wind shear hazards
[AD-A080588] N80-20243
Inertially augmented approach couplers
[AD-A080488] N80-20248
WIND TUNNEL CALIBRATION
Scale model studies for establishing the flow patterns of a low-speed tunnel
[NASA-CR-159234] N80-20265
WIND TUNNEL MODELS
Assessment of environmental wind conditions by wind tunnel model studies --- buildings
[PB80-115926] N80-20445
WIND TUNNEL TESTS
Aerothermal evaluation of high-temperature structural materials for use in high-performance missile design
[AD-A080023] N80-20319
Assessment of environmental wind conditions by wind tunnel model studies --- buildings
[PB80-115926] N80-20445
WINDMILLS (WINDPOWERED MACHINES)
Wind Energy System Time-domain (WEST) analyzers using hybrid simulation techniques
[NASA-CR-159737] N80-20909
WINDPOWER UTILIZATION
Wind energy in the mountains of New Hampshire as a potential energy source for Portsmouth Naval Shipyard
[AD-A076975] N80-20886
Wind energy information directory
[SERI/SP-69-290] N80-20883
Darrieus vertical axis wind turbine program overview
[SAND-79-2146C] N80-20891
Wind energy systems
[SERI/PR-351-480] N80-20892
Wind Energy System Time-domain (WEST) analyzers using hybrid simulation techniques
[NASA-CR-159737] N80-20909
WINDPOWERED GENERATORS
Mod 1 wind turbine generator failure modes and effects analysis
[NASA-CR-159494] N80-20864
Wind energy information directory
[SERI/SP-69-290] N80-20883
Darrieus vertical axis wind turbine program overview
[SAND-79-2146C] N80-20891
Wind energy systems
[SERI/PR-351-480] N80-20892
Wind Energy System Time-domain (WEST) analyzers using hybrid simulation techniques
[NASA-CR-159737] N80-20909
WING TIPS
Airflow effects on riming measurements by a wing tip-mounted ice detector on the MC130E research airplane
[AD-A077019] N80-20244
WINGS
Detection of the transitional layer between laminar and turbulent flow areas on a wing surface --- using an accelerometer to measure pressure levels during wind tunnel tests
[NASA-CASE-LAR-12261-1] N80-20224
On wings of circular design
[NASA-TM-75505] N80-20229
Ground plane effects on a contoured surface at low subsonic velocities
[AD-A079877] N80-20237
WINTER
National winter storms operations plan
[PB80-118425] N80-21000
WIRE
Nickel contaminated titanium weld wire study
[LTR-141-93] N80-20381
Fabrication of superconducting wire composites by directional solidification
[IS-4698] N80-20501
WORKLOADS (PSYCHOPHYSIOLOGY)
Summary of Department of Transportation/Federal Aviation Administration task force on crew workload report
[AD-A068189] N80-21052
WYOMING
Energy source book --- Colorado, Montana, North Dakota, South Dakota, Utah, and Wyoming
[DOE/TIC-10190] N80-20895

X

X RAY ANALYSIS
Frame C: A compact procedure for quantitative energy-dispersive electron probe X-ray analysis
[PB80-110307] N80-20570
Status of radiographic study, development, and new applications in the LASL Nondestructive Testing Group
[LA-UR-79-2648] N80-20606
X RAY DIFFRACTION
X-ray diffraction analysis of selected paint pigments --- traffic paints
[PB80-113061] N80-20401
Standard X-ray diffraction powder patterns. Section 16: Data for 86 substances
[PB80-110364] N80-21169
X RAY IMAGERY
Image properties of an X-ray telescope of the Wolter-1 type with emphasis on contrast reduction by diffuse reflection
[NASA-TM-75805] N80-21224

X RAY INSPECTION
Status of radiographic study, development, and new applications in the LASL Nondestructive Testing Group
[LA-UR-79-2648] N80-20606
X RAY SPECTROSCOPY
Reliability of energy dispersive X-ray fluorescence analysis of low-alloy steels
[AD-A077194] N80-20371
X-ray analysis of accrued damage in stress corrosion and corrosion fatigue — 304 austenitic stainless steel and al 2024
[AD-A078511] N80-20372
X RAY TELESCOPES
Image properties of an X-ray telescope of the Wolter-1 type with emphasis on contrast reduction by diffuse reflection
[NASA-TM-75805] N80-21224
X-Y PLOTTERS
Testing the accuracy of cartographic equipment: First results N80-20683
XENON
Brillouin scattering in xenon near the critical point N80-21099

Y

YAG LASERS
Extending the Neodymium-YAG laser reflectance measuring system to lunar measurements at the Wetzell station N80-20695
YIELD
Assessing soybean leaf area and leaf biomass by spectral measurements — Beltsville, Maryland Agricultural Research Center N80-20775
YOKES
A normal yoke for the determination of the magnetic characteristics of electrical sheets
[BLL-RTS-11946] N80-20481

Z

ZENITH
Radiometric resolution for monitoring vegetation: How many bits are needed? N80-20777
ZINC
Zinc halide hydrocracking process for distillate fuels from coal
[FE-1743-68] N80-20429
ZINC COATINGS
Corrosion resistance of zinc-level plated U-0.75 Ti
[AD-A075539] N80-20873
ZINC OXIDES
Metal-insulator-semiconductor aspects of monolithic zinc oxide surface acoustic wave structures N80-20493
ZIRCALOYS (TRADEMARK)
Mechanical properties of crystalline solids — transient deformation, grain boundary, sliding, and grain boundary cavitation processes in Zircaloys
[COO-2172-29] N80-21190
ZIRCONIUM ALLOYS
Analytical electron microscope study of the omega phase transformation in a zirconium-niobium alloy
[COO-1198-1279] N80-20385
Influence of magnetic ordering on the superconducting properties of amorphous (Zr/sub 1-x/Er/sub x/)3Rh alloys
[CALT-822-110] N80-20502

PERSONAL AUTHOR INDEX

Typical Personal Author Index Listing

Listings in this Index are arranged alphabetically by personal author. The NASA accession number denotes the number by which the citation is identified.

CORPORATE SOURCE INDEX

Typical Corporate Source Index Listing

Listings in this index are arranged alphabetically by corporate source. The title of the document provides the user with a brief description of the subject matter. The report number helps to indicate the type of document cited (e.g., NASA report, translation, NASA contractor report). The NASA accession number denotes the number by which the citation is identified. The titles are arranged under each corporate source in ascending accession number order.

A

ADELPHI UNIV., GARDEN CITY, N. Y.
A study of magnetogravity waves N80-20955

AEROJET SOLID PROPULSION CO., SACRAMENTO, CALIF.
Structural assessment of involutes
[AD-A077875] N80-20318

AEROSPACE CORP., EL SEGUNDO, CALIF.
Combined pseudo range and Doppler positioning for the stationary NAVSTAR user
[AD-A079543] N80-20256
Coil spring failures in aerospace hardware
[AD-A077808] N80-20595

AEROSPACE CORP., LOS ANGELES, CALIF.
Reversal of nickel cadmium cells N80-20849

AIR FORCE AERO PROPULSION LAB., WRIGHT-PATTERSON AFB, OHIO.
NWSC nickel cadmium spacecraft cell accelerated life test program data analysis N80-20852

AIR FORCE AVIONICS LAB., WRIGHT-PATTERSON AFB, OHIO.
A standardization evaluation potential study of the common multi-mode radar program
[AD-A079678] N80-20459
Passive fiber optic gyro study
[AD-A079471] N80-20566
Magnetic bubble research
[AD-A078702] N80-21040

AIR FORCE FLIGHT DYNAMICS LAB., WRIGHT-PATTERSON AFB, OHIO.
Investigation of numerical techniques for predicting aerodynamic heating to flight vehicles
[AD-A078121] N80-20234

AIR FORCE GEOPHYSICS LAB., HANSCOM AFB, MASS.
A test of the climatic normality of synthetic profiles of atmospheric liquid water content over the USSR in 1973
[AD-A077021] N80-20990

AIR FORCE INST. OF TECH., WRIGHT-PATTERSON AFB, OHIO.
Ground plane effects on a contoured surface at low subsonic velocities
[AD-A079677] N80-20237
Development of a bird/aircraft strike hazard assessment methodology
[AD-A075584] N80-20246
A study of two avionics life cycle cost models and their applicability
[AD-A076981] N80-20268
An operating and support cost model for avionics automatic test equipment
[AD-A075586] N80-20269
Velocity profiles in a long inlet duct employing a photon correlating laser velocimeter without seeding
[AD-A079878] N80-20278
An experimental study of static thrust augmentation using a 2-d variable ejector
[AD-A079857] N80-20279
Orbital estimation using two-body classical orbital elements as measurement updates
[AD-A079903] N80-20290
Use of an aerodynamic turn to maximize the orbit inclination change for the space shuttle orbiter
[AD-A079855] N80-20291
Stabilizing an unstable orbit about L3 in the Sun, Earth, Moon system using linear constant gain feedback
[AD-A079860] N80-20292
Application and comparison of stable periodic orbits in the vicinity of Lagrangian points L4 and L5 to a four-body truth model
[AD-A079683] N80-20293
Determination of the minimum delta 5 transfer trajectory from a low Earth orbit to a stable orbit around the Lagrangian point L4 in a restricted four-body system
[AD-A079881] N80-20295
A numerical study of normal-shock/turbulent boundary layer interactions
[AD-A079858] N80-20537
A calibration of the Preston tube in liquid flow systems
[AD-A079876] N80-20538
Holographic interferometric survey of boundary layer transition in an axisymmetric free convection thermal boundary layer
[AD-A079880] N80-20567
Separation control in all apt light pipe
[AD-A079904] N80-20577
The prediction of mass loaded natural frequencies and forced response of complex, rib-stiffened structures
[AD-A079856] N80-20625
Effect of imperfections on the collapse of rectangular plates using variational calculus
[AD-A079905] N80-20627
Analytical/experimental investigation of the instability of composite cylindrical panels
[AD-A079850] N80-20628
Column buckling of isotropic and composite beams using a truncated Fourier series
[AD-A079862] N80-20629
Computer simulation of a solar energy system which utilizes flat-plate collectors
[AD-A079906] N80-20670
Application of Bayesian approach to updating air frame CERs
[AD-A077064] N80-21064

AIR FORCE MATERIALS LAB., WRIGHT-PATTERSON AFB, OHIO.
ISS/SIMS characterization of UV/O sub 3 cleaned surfaces
[AD-A078425] N80-20375

AIR FORCE PACKAGING EVALUATION AGENCY, WRIGHT-PATTERSON AFB, OHIO.
Evaluation of packaging for the CN-1325/ASN-108 AHRS displacement gyro, F-15 aircraft
[AD-A078707] N80-20264

AIR POLLUTION TECHNOLOGY, INC., SAN DIEGO, CALIF.
Development of superior entrainment separators
[PB80-112394] N80-20938

AKRON UNIV., OHIO.
Experimental study of cap and thickness influence on the vibration response and damping of flexible fluid-coupled coaxial cylinders
[CONF-790615-14] N80-20633

ALABAMA UNIV., TUSCALOOSA.
Sources of tracking error in millimeter wavelength missile guidance systems
[AD-A078226] N80-20298

ALUMINUM CO. OF AMERICA, ALCOA CENTER, PA.
Production of aluminum-silicon alloy and ferrosilicon and commercial purity aluminum by the direct reduction process, phase B
[CONS/5089-7] N80-20382

AMERICAN SOCIETY OF CIVIL ENGINEERS, NEW YORK.
International symposium on urban hydrology: Proceedings of two special sessions, spring annual meeting, American Geophysical Union
[PB80-123078] N80-20805
Challenges in urban runoff control (planning, implementation and simulation)
[PB80-107873] N80-21221

AMES LAB., IOWA.
Fabrication of superconducting wire composites by directional solidification
[IS-4698] N80-20501

ANALYSIS AND COMPUTER SYSTEMS, INC., BURLINGTON, MASS.
Development of numerical techniques and computer systems for design, analysis and fabrication of interdigital transducers as surface acoustic wave devices
[AD-A079623] N80-20493

ANALYTICAL AND COMPUTATIONAL MATHEMATICS, INC., HOUSTON, TEX.
Coding, testing and documentation of processors for the flight design system
[NASA-CR-160552] N80-20289

APPLIED PHYSICS LAB., JOHNS HOPKINS UNIV., LAUREL, MD.
NAVPAC: A space-qualified navigation package
[AD-A077062] N80-20294
A variational approximation for scattering of scalar waves by stochastic surfaces
[AD-A077066] N80-20463
Long-period terms in the neutral density of the upper atmosphere
[PB80-119464] N80-20978
Geothermal energy market penetration: Development of a model for the residential section
[PB80-118359] N80-21198

ARGONNE NATIONAL LAB., ILL.
Grain-boundary diffusion: Structural effects, models and mechanisms
[CONF-7909100-1] N80-20387
Production of methane using an anaerobic filter
[ANL-TRANS-1164] N80-20428
Support studies in fluidized-bed combustion 1978 annual report
[PB80-112758] N80-20430
Evaluation of some cryogenic sensors and instrumentations for a large superconducting MHD magnet
[CONF-790815-30] N80-20568
Decontamination of metals containing plutonium and americium
[ANL-78-13] N80-20599
Projections of direct energy consumption by mode: The 1975 - 2000 baseline
[ANL/CNSV-4] N80-20878

SOURCE

Thermal fluid selection for long-distance heat transmission
[CONF-790803-47] N80-20879

Development of an example control strategy for lead
[PB80-123029] N80-20943

Physics with fast molecular-ion beams
[ANL/PHY-79-3] N80-21115

Determination of molecular-ion structures through studies of the collisionally-induced dissociation of fast (MeV) molecular ions
[CONF-790843-10] N80-21116

Comparison of jet size in anti-neutrino proton interactions with that in positron electron annihilation
[ANL-HEP-PR-79-17] N80-21117

Advances in MHD technology
[CONF-790598-5] N80-21166

Energy of 100 coincidence twist boundaries in transition metal oxides
[CONF-7907101-2] N80-21179

ARINC RESEARCH CORP., ANNAPOLIS, MD.

Mechanization architecture for enhancement of avionics planning data base
[AD-A075572] N80-20267

ARIZONA UNIV., TUCSON.

Pollutant formation in flat laminar opposed jet diffusion flames N80-20919

ARMED FORCES COMMUNICATIONS AND ELECTRONICS ASSOCIATION, EATONTOWN, N. J.

The Art of Communications Interfaces; technology insertion in the C3I arena: Proceedings of the 4th Annual Seminar
[AD-A078344] N80-20471

ARMY AEROMEDICAL RESEARCH UNIT, FORT RUCKER, ALA.

A direct measure of CRT image quality
[AD-A075610] N80-21146

ARMY ARMAMENT RESEARCH AND DEVELOPMENT COMMAND, DOVER, N. J.

TNT equivalency of benite propellant
[AD-A077108] N80-20406

Design of helical compression springs
[AD-A077113] N80-20593

The application of DC-DC energy conversion in a solar energy system
[AD-A077112] N80-20867

ARMY ARMAMENT RESEARCH AND DEVELOPMENT COMMAND, WATERVLIET, N. Y.

Thermo-elastic-plastic stresses in hollow cylinders due to quenching
[AD-A077109] N80-20622

ARMY AVIATION ENGINEERING FLIGHT ACTIVITY, EDWARDS AFB, CALIF.

Preliminary airworthiness evalaution, AH-1G with the airborne target acquisition fire control system and the hellfire modular missile system installed
[AD-A078340] N80-20265

ARMY AVIATION RESEARCH AND DEVELOPMENT COMMAND, CLEVELAND, OHIO.

Composite wall concept for high temperature turbine shrouds: Survey of low modulus strain isolator materials
[NASA-TM-81443] N80-20398

ARMY COMMAND AND GENERAL STAFF COLL., FORT LEAVENWORTH, KANSAS.

F-4 Phantom aircrew survival equipment evaluation
[AD-A076330] N80-20245

ARMY COMMUNICATIONS-ELECTRONICS COMBAT DEVELOPMENTS AGENCY, FORT HUACHUCA, ARIZ.

Standard engineering installation package AN/TSQ-117, aircraft control central

Description of data entry for automated cost estimating
[K/CSD/TM-29-REV-1] N80-21196

UNION CARBIDE CORP., SOUTH CHARLESTON, W.VA.

Treatment of organic chemical manufacturing wastewater for reuse
[PB80-105166] N80-21217

UNITED TECHNOLOGIES CORP., SOUTH WINDSOR, CONN.

Lightweight fuel cell powerplant components program
[NASA-CR-161412] N80-20306

UNITED TECHNOLOGIES RESEARCH CENTER, EAST HARTFORD, CONN.

Beamed energy coupling studies
[AD-A080037] N80-20578

UNIVERSAL OIL PRODUCTS CO., SAN DIEGO, CALIF.

Research and development on a spiral-wound membrane system for single-stage seawater desalination
[PB80-114705] N80-20357

UNIVERSITIES SPACE RESEARCH ASSOCIATION, BOULDER, COLO.

The present status of atmospheric electricity, report of the USRA atmospheric electricity study panel
[PB80-111479] N80-20979

UNIVERSITY OF SOUTH FLORIDA, TAMPA.

Combustion of methanol coal slurries in Hartmann resonator
[FE-2744-T2] N80-20351

UNIVERSITY OF SOUTHERN CALIFORNIA, LOS ANGELES.

Image understanding research
[AD-A078034] N80-20454

Evaluation of gallium nitride for active microwave devices
[AD-A079319] N80-20494

UTAH UNIV., SALT LAKE CITY.

Noise suppression methods for robust speech processing
[AD-A079321] N80-20466

V

VANDERBILT UNIV., NASHVILLE, TENN.

Development of a biological simulation monitor for joint municipal/industrial treatment systems
[PB80-111032] N80-20951

VARIAN ASSOCIATES, PALO ALTO, CALIF.

Multiband Klystron study
[AD-A078036] N80-20490

High power millimeter wave amplifier
[AD-A078007] N80-20491

VERMONT STATE DEPT. OF HEALTH, BURLINGTON.

Ozone and ultraviolet radiation disinfection for small community water systems
[PB80-108418] N80-21220

VIRGINIA POLYTECHNIC INST. AND STATE UNIV., BLACKSBURG.

Fast Fourier transform square wave voltammetry N80-20335

A fundamental approach to adhesion: Synthesis, surface analysis, thermodynamics and mechanics
[NASA-CR-162903] N80-20397

The effects of pitching rate on the hydrodynamic properties of hydrofoils
[AD-A079810] N80-20438

The dynamics of an ultrasonic cavitation bubble N80-20520

Pulsatile laminar flow separation in an exponentially diverging tube N80-20526

Use of two-dimensional transmission photoelastic models to study stresses in double-lap bolted joints: Load transfer and stresses in the inner lap
[VPI-E-80-9] N80-20621
Research on new electronic display technologies
[AD-A079323] N80-21035

VIRGINIA UNIV., CHARLOTTESVILLE.
Investigation of elongation of boron filament during fabrication and annealing N80-20310
Dynamics of flexible rotors partially filled with a viscous incompressible fluid N80-20513
Rotor model parameters estimation and rotor balancing studies with quadratic programming N80-20587
Human comfort response to dominant random motions in longitudinal modes of aircraft motion
[NASA-CR-159186] N80-21033
Human comfort response to random motions with a dominant pitching motion
[NASA-CR-159140] N80-21034
Investigation of direct integrated optics modulators
[NASA-CR-162894] N80-21143

W

WASHINGTON STATE UNIV., PULLMAN.
Electrochemical polymerization and deposition on carbon fibers N80-20396

WASHINGTON UNIV., SEATTLE.
Structural evaluation of sulphur-asphalt pavements N80-20436
Initial-value problems in stratified shear flows
[AD-A079525] N80-20542
Periglacial research
[AD-A079280] N80-20967
Angular momentum transfer in deeply inelastic collisions
[RLO-1388-395] N80-21111

WATER RESEARCH CENTRE, STEVENAGE (ENGLAND).
Studies of water, 1978-1979 N80-20931

WAYNE STATE UNIV., DETROIT, MICH.
Flame propagation, autoignition and combustion in alcohol-petroleum-air mixtures and other alternative fuels
[COO-4486-5] N80-20420

WEI[illegible]NGER ASSOCIATES, NEW YORK.
Resonance zones on the surface of a dipping layer due to plane SH seismic input
[PB80-107907] N80-20980

WESTINGHOUSE ELECTRIC CORP., PITTSBURGH, PA.
Development, testing and evaluation of MHD materials and components designs
[FE-2248-22] N80-21160

WISCONSIN UNIV. - MADISON.
Finite-amplitude solitary water waves
[AD-A079718] N80-20546
A diagonally dominant solution for the cylinder end problem and a non-axisymmetric elasticity solution for a truncated spherical dome N80-20612
A Differential population synthesis approach to mass segregation in M92 N80-20614
Energy release rate calculations for interface edge cracks based on a conservation integral
[AD-A079723] N80-20626
Interferometric study of the natural convection characteristics of flat plate, slat and vee-corrugated solar collectors
[COO-2971-6] N80-20900
Precipitation and accumulation estimates for East Antarctica, derived from rawinsonde information N80-20956
Summer circulation over South America from satellite data N80-20983
Closed-loop eigenvalue specification for infinite dimensional systems augmented and deficient hyperbolic cases
[AD-A079727] N80-21053
An estimate related to the strong maximum principle
[AD-A079705] N80-21065
Some new mathematical methods for variational objective analysis using splines and cross validation
[AD-A079302] N80-21067
The Boltzmann equation with a soft potential. Part 1: Linear, spatially-homogeneous
[AD-A079706] N80-21068
Abstract optimality theory
[AD-A079707] N80-21069
On the maximality of the sum of two maximal monotone operators
[AD-A079724] N80-21070
Bifurcations of a model diffusion-reaction
[AD-A079725] N80-21071
A globally convergent ball newton method
[AD-A079728] N80-21072
On subharmonic solutions of Hamiltonian systems
[AD-A079729] N80-21073
On efficient time-stepping methods for nonlinear second order hyperbolic partial differential equations
[AD-A079731] N80-21074
The use of the tetrachoric series for evaluating multivariate normal probabilities
[AD-A079721] N80-21093
Nearly balanced incomplete block designs
[AD-A079726] N80-21094
Divertor experiments in a toroidal plasma, with ExB drift due to an applied radial electric field N80-21151
Stability analysis of cylindrical Vlasov equilibria N80-21152
Vacuum ultraviolet spectroscopic study of plasma impurities in the Tokapole 2 poloidal divertor experiment
[COO-2387-111] N80-21162
The structure and dynamics of H2 regions N80-21229

WOODARD-CLYDE CONSULTANTS, SAN FRANCISCO, CALIF.
Environmental assessment methodology: Solar power plant applications. Volume 3. Environmental impact assessment application
[EPRI-ER-1070-VOL-3] N80-20889
Environmental assessment methodology: Solar power plant applications. Volume 1. Environmental impact assessment methodology
[EPRI-ER-1070-VOL-1] N80-20926

WOODWARD ASSOCIATES, INC., SAN DIEGO, CALIF.
PLASTIC CANOPY: A computer program for the structural analysis of protective canopies
[PB80-122724] N80-20798

WORCESTER POLYTECHNIC INST., MASS.
Kinetics and mechanisms of catalytic hydroliquefaction and hydrogasification of lignite
[FE-2702-7] N80-20421

WRIGHT STATE UNIV., DAYTON, OHIO.
An approximate analysis of wing unsteady aerodynamics
[AD-A079322] N80-20239

CONTRACT NUMBER INDEX

Typical Contract Number Index Listing

Listings in this index are arranged alphanumerically by contract number. Under each contract number the NASA accession numbers denoting documents that have been produced as a result of research done under that contract are arranged in ascending order. The NASA accession number denotes the number by which the citation is identified.

REPORT/ACCESSION NUMBER INDEX

Typical Report/Accession Number Index Listing

Listings in this index are arranged alphanumerically by report number. The NASA accession number denotes the number by which the citation is identified. An asterisk (*) indicates that the item is a NASA report. A pound sign (#) indicates that the item is available on microfiche.

PUBLIC COLLECTIONS OF NASA DOCUMENTS

DOMESTIC

NASA distributes its technical documents and bibliographic tools to eleven special libraries located in the organizations listed below. Each library is prepared to furnish the public such services as reference assistance, interlibrary loans, photocopy service, and assistance in obtaining copies of NASA documents for retention.

CALIFORNIA
University of California, Berkeley

COLORADO
University of Colorado, Boulder

DISTRICT OF COLUMBIA
Library of Congress

GEORGIA
Georgia Institute of Technology, Atlanta

ILLINOIS
The John Crerar Library, Chicago

MASSACHUSETTS
Massachusetts Institute of Technology, Cambridge

MISSOURI
Linda Hall Library, Kansas City

NEW YORK
Columbia University, New York

OKLAHOMA
University of Oklahoma, Bizzell Library

PENNSYLVANIA
Carnegie Library of Pittsburgh

WASHINGTON
University of Washington, Seattle

NASA publications (those indicated by an "*" following the accession number) are also received by the following public and free libraries

CALIFORNIA
Los Angeles Public Library
San Diego Public Library

COLORADO
Denver Public Library

CONNECTICUT
Hartford Public Library

MARYLAND
Enoch Pratt Free Library, Baltimore

MASSACHUSETTS
Boston Public Library

MICHIGAN
Detroit Public Library

Cleveland Public Library
Dayton Public Library
Toledo Public Library

TENNESSEE
Memphis Public Library

TEXAS
Dallas Public Library
Fort Worth Public Library

WASHINGTON
Seattle Public Library

WISCONSIN
Milwaukee Public Library

An extensive collection of NASA and NASA-sponsored documents and aerospace publications available to the public for reference purposes is maintained by the American Institute of Aeronautics and Astronautics, Technical Information Service, 555 West 57th Street, 12th Floor, New York, New York 10019

EUROPEAN

An extensive collection of NASA and NASA-sponsored publications is maintained by the British Library Lending Division, Boston Spa, Wetherby, Yorkshire, England. By virtue of arrangements other than with NASA, the British Library Lending Division also has available many of the non-NASA publications cited in *STAR*. European requesters may purchase facsimile copy of microfiche of NASA and NASA-sponsored documents, those identified by both the symbols "#" and "*", from: ESA - Information Retrieval Service, European Space Agency, 8-10 rue Mario-Nikis, 75738 Paris CEDEX 15, France.

STAR
AN ABSTRACT JOURNAL

Scientific and Technical Aerospace Reports

PRODUCED BY THE
SCIENTIFIC AND TECHNICAL
INFORMATION
BRANCH

NASA

NATIONAL AERONAUTICS AND SPACE ADMINISTRATION

NAS 1.9/4:

WHAT YOU CAN DO FOR *STAR*

All users of this abstract service are urged to forward reports to be considered for announcement in *STAR*. This will aid NASA in its efforts to provide the fullest possible coverage of all scientific and technical publications that might support aeronautics and space research and development. If you have prepared relevant reports (other than those that you will transmit to NASA, DoD, or DOE through the usual contract- or grant-reporting channels), please send them for consideration to the NASA Scientific and Technical Information Facility, P. O. Box 8757, B. W. I. Airport, Maryland 21240.

Reprints of journal articles, book chapters, and conference papers are also welcome. These will be considered for announcement in *STAR's* companion journal, *International Aerospace Abstracts*.

You may specify a particular source to be included in a report announcement if you wish; otherwise the report will be placed on public sale at the National Technical Information Service. Copyrighted publications will be announced but not distributed or sold.

PURCHASE OF *STAR*

The semimonthly issues and the cumulative index issues are available postpaid on subscription and in single copy from the Superintendent of Documents, United States Government Printing Office, Washington, D.C., 20402, United States of America.

Semimonthly issues...

Annual subscription rates: $60.00 domestic; $75.00 foreign. Price per single copy: $2.50 domestic; $3.15 foreign.

Cumulative index issues, semiannual and annual...

Annual subscription rates for both: $25.00 domestic; $31.25 foreign. Price per single copy: semiannual $9.50 domestic, $11.90 foreign; annual $16.00 domestic, $20.00 foreign.

Domestic subscription rates...

Apply to the United States, Canada, Mexico, and all Central and South American countries, except as noted below.

Foreign subscription rates...

Apply to Argentina, Brazil, French Guiana, Guyana, Surinam, Belize, and all other countries throughout the world.

Payment should be by check, money order, or document coupons, and must accompany order. Remittances from foreign countries should be made by international money order or draft on an American bank, payable to the Superintendent of Documents, or by UNESCO book coupons.

PUBLISHED BY:

UNITED STATES GOVERNMENT
NATIONAL AERONAUTICS AND SPACE ADMINISTRATION
SCIENTIFIC AND TECHNICAL INFORMATION BRANCH
Scientific and Technical Aerospace Reports, Volume 18, is prepared by the NASA Scientific and Technical Information Facility operated for the National Aeronautics and Space Administration by PRC Data Services Company.

The Administrator of the National Aeronautics and Space Administration has determined that the publication of this periodical is necessary in the transaction of the public business required by law of this Agency. Use of funds for printing this periodical has been approved by the Director of the Office of Management and Budget through June 30, 1981.

US ISSN 0036-8741

INTRODUCTION

Scientific and Technical Aerospace Reports (STAR) is a major component of a comprehensive National Aeronautics and Space Administration information system covering aeronautics, space, and supporting disciplines. *STAR* is issued on the 8th and 23rd of each month and announces current publications of the following types:

- NASA, NASA contractor, and NASA grantee reports
- Reports issued by other U.S. Government agencies, domestic and foreign institutions, universities, and private firms
- Translations in report form
- NASA-owned patents and patent applications
- Dissertations and theses

NEWARK PUBLIC LIBRARY
JUL 9 1980
U. S. GOVT. PUBS.
DEPOSITORY 376

Cumulative index volumes are published semiannually and annually.

Journal, book, and conference literature, cover-to-cover journal translations, and certain foreign dissertations are announced in a companion journal, *International Aerospace Abstracts (IAA)*, available on subscription from the American Institute of Aeronautics and Astronautics, Technical Information Service, 555 West 57th Street, 12th Floor, New York, New York 10019.

ON-GOING RESEARCH PROJECTS

By arrangement between NASA and the Smithsonian Science Information Exchange (SSIE), a separate section of information on aerospace-related *On-Going Research Projects* is inserted into each issue of *STAR*. The insert presents titles of active NASA grants and university contracts, summary portions of recently updated *NASA Research and Technology Objectives and Plans (RTOPs)*, and notices of non-NASA research projects that were funded in the most recent or current fiscal year. The latter are selected by SSIE. The project announcements in the insert are arranged by *STAR* divisions but are otherwise entirely separate from *STAR*. They are not indexed nor machine-searchable by NASA. Current and retrospective searches are available from SSIE, 1730 M Street, N.W., Washington, D.C. 20036.

SUBJECT SCOPE

Subject scope of *STAR*, *IAA*, and *On-Going Research Projects* includes all aspects of aeronautics and space research and development, supporting basic and applied research, and applications. Aerospace aspects of earth resources, energy development, conservation, oceanography, environmental protection, urban transportation, and other topics of high national priority are also covered.

OTHER NASA PUBLICATIONS

Other NASA publications and information services are described in the publication, *The NASA Scientific and Technical Information System ... and How to Use It*, available without charge from the NASA Scientific and Technical Information Facility, P. O. Box 8757, B. W. I. Airport, Maryland 21240.

HOW TO USE STAR SUBJECT CATEGORIES

STAR is categorized by 10 major subject divisions divided into 74 specific subject categories and one general category/division. The major subject divisions are listed in the Table of Contents, together with a note for each that defines its scope and provides any cross-references. For example:

AERONAUTICS

Includes aeronautics (general); aerodynamics; air transportation and safety; aircraft communications and navigation; aircraft design, testing and performance; aircraft instrumentation; aircraft propulsion and power; aircraft stability and control; and research and support facilities (air).

For related information see also *Astronautics*

Each major division is further divided into as many as nine specific categories, which are identified by category numbers.

Abstracts in *STAR* are grouped by specific category, the categories appearing in sequential order. Category breaks in the abstract section are identified by the category number and title, and a scope note. Cross-references to other categories are provided as appropriate. For example:

02 AERODYNAMICS

Includes aerodynamics of bodies, combinations, wings, rotors, and control surfaces; and internal flow in ducts and turbomachinery.

For related information see also *34 Fluid Mechanics and Heat Transfer*.

CROSS-REFERENCES

Individual *STAR* abstracts are not ordinarily cross-referenced, except for certain conference reports or book translations that have had separate abstracts written for their component papers or chapters. Citations and abstracts of the components follow immediately after those of the parent document. When the subject content of a component differs sufficiently from the general content of the parent, a cross-reference citation also is printed at the end of the category to which it normally would have been assigned if it were independent.

DOCUMENTS ON MICROFICHE

Documents on microfiche[1] are designated by a pound sign (#) following the accession number. The pound sign is used without regard to the source or quality of the microfiche.

AVAILABILITIES

One or more sources from which a document announced in *STAR* is available to the public is given in each citation. The most commonly indicated sources and their acronyms or abbreviations are listed below. If the publication is available from a source other than those listed, the publisher and his address will be displayed on the availability line or in combination with the corporate source line.

(1) A microfiche is a transparent sheet of film, 105 by 148 mm in size, containing as many as 60 to 98 pages of information reduced to micro images (not to exceed 26:1 reduction).

Avail: NTIS. Sold by the National Technical Information Service. Prices for hard copy (HC) and microfiche (MF) are indicated by a price code following the letters HC or MF in the *STAR* citation. Current values for the price codes are given in the tables on page vii.

Initially distributed microfiche under the NTIS SRIM (Selected Research in Microfiche) is available at greatly reduced unit prices. For this service and for information concerning subscription to NASA printed reports, consult the NTIS Subscription Section, Springfield, Va. 22161.

NOTE ON ORDERING DOCUMENTS: When ordering NASA publications (those followed by the * symbol), use the N accession number. NASA patent applications (only the specifications are offered) should be ordered by the US-Patent-Appl-SN number. Non-NASA publications (no asterisk) should be ordered by the AD, PB, or other *report* number shown on the last line of the citation, not by the N accession number. It is also advisable to cite the title and other bibliographic identification.

Avail: SOD (or GPO). Sold by the Superintendent of Documents, U.S. Government Printing Office, in hard copy. The current price and order number are given following the availability line. (NTIS will fill microfiche requests, at the standard $3.50 price, for those documents identified by a # symbol.)

Avail: NASA Public Document Rooms. Documents so indicated may be examined at or purchased from the National Aeronautics and Space Administration, Public Documents Room (Room 126), 600 Independence Ave., S.W., Washington, D.C. 20546, or public document rooms located at each of the NASA research centers, the NASA Space Technology Laboratories, and the NASA Pasadena Office at the Jet Propulsion Laboratory.

Avail: DOE Depository Libraries. Organizations in U.S. cities and abroad that maintain collections of Department of Energy reports, usually in microfiche form, are listed in *Energy Research Abstracts*. Services available from the DOE and its depositories are described in a booklet, *DOE Technical Information Center - Its Functions and Services* (TID-4660), which may be obtained without charge from the DOE Technical Information Center.

Avail: Univ. Microfilms. Documents so indicated are dissertations selected from *Dissertation Abstracts* and are sold by University Microfilms as xerographic copy (HC) and microfilm. All requests should cite the author and the Order Number as they appear in the citation.

Avail: USGS. Originals of many reports from the U.S. Geological Survey, which may contain color illustrations, or otherwise may not have the quality of illustrations preserved in the microfiche or facsimile reproduction, may be examined by the public at the libraries of the USGS field offices whose addresses are listed in this Introduction. The libraries may be queried concerning the availability of specific documents and the possible utilization of local copying services, such as color reproduction.

Avail: HMSO. Publications of Her Majesty's Stationery Office are sold in the U.S. by Pendragon House, Inc. (PHI), Redwood City, California. The U.S. price (including a service and mailing charge) is given, or a conversion table may be obtained from PHI.

Avail: BLL (formerly NLL): British Library Lending Division, Boston Spa, Wetherby, Yorkshire, England. Photocopies available from this organization at the price shown. (If none is given, inquiry should be addressed to the BLL.)

Avail: Fachinformationszentrum, Karlsruhe. Sold by the Fachinformationszentrum Energie, Physik, Mathematik GMBH, Eggenstein Leopoldshafen, Federal Republic of Germany, at the price shown in deutschmarks (DM).

Avail: Issuing Activity, or Corporate Author, or no indication of availability. Inquiries as to the availability of these documents should be addressed to the organization shown in the citation as the corporate author of the document.

Avail: U.S. Patent and Trademark Office. Sold by Commissioner of Patents and Trademarks, U.S. Patent and Trademark Office, at the standard price of 50 cents each, postage free. (See discussion of patents and patent applications below.)

NASA PATENTS AND PATENT APPLICATIONS

Patents and patent applications owned by NASA are announced in *STAR* under appropriate subject categories and are referenced in the *STAR* indexes. In the Report/Accession Number Index, patents are indexed by the NASA Case Number (which appears in lieu of the report number in other indexes), the U.S. Patent Number, the U.S. Patent Application Serial Number, and the U.S. Patent Class. Patent applications for which patents have not yet been issued are indexed by the NASA Case Number and the U.S. Patent Application Serial Number.

NASA *patent application specifications* are sold in paper copy by the National Technical Information Service at price code A02 ($5.00 domestic; $10.00 foreign). Microfiche are sold at price code A01 ($3.50 domestic; $5.25 foreign). The US-Patent-Appl-SN- number should be used in ordering either paper copy or microfiche from NTIS. Printed copies of *patents* (which are not microfiched) are available for purchase at 50 cents per copy from:

Commissioner of Patents and Trademarks
U.S. Patent and Trademark Office
Washington, D.C. 20231

When ordering patents, the U.S. Patent Number should be used, and payment must be remitted in advance, preferably by money order or check payable to the Commissioner of Patents and Trademarks. Prepaid purchase coupons for ordering are also available from the Patent and Trademark Office. The patents and patent applications announced in *STAR* are owned by NASA and are available for royalty-free licensing. Requests for licensing terms and further information should be addressed to:

Assistant General Counsel for Patent Matters/Code GP-1
National Aeronautics and Space Administration
Washington, D.C. 20546

ELIGIBILITY AND REGISTRATION FOR NASA INFORMATION PRODUCTS AND SERVICES

A variety of services, in addition to the distribution of NASA scientific and technical reports and of *STAR* and its cumulative indexes, is available to organizations of the following types that have registered with NASA to receive specific services or products:

1. NASA offices, research centers, contractors, subcontractors, grantees, and consultants;

2. Other U.S. Government agencies and their contractors;
3. Libraries in the United States that have arrangements with NASA to maintain collections of NASA documents for public reference;
4. Other organizations in the United States having a need for NASA documents in work related to aeronautics and space research;
5. Organizations abroad that have established reciprocal document exchange arrangements with NASA.

Only the central service points or central points of document acquisition and control within qualified organizations are eligible to register for NASA products and services. Domestic organizations that may be eligible to receive various classes of NASA publications and services should address their requests for registration or for further information to:

NASA Scientific and Technical Information Facility
Attn.: Registration Activity
P.O. Box 8757
B.W.I. Airport, Maryland 21240

Organizations abroad should direct requests to the same address, but to the attention of: International Exchange Program.

AVAILABILITY OF STAR ABSTRACTS ON MICROFICHE

Microfiche of the abstract sections of this issue ahd other issues of *STAR* are available on annual subscription from NTIS, Attn: Subscriptions, 5285 Port Royal Road, Springfield, Virginia 22161. Annual subscription rates are $45.00 North America; $90.00 foreign. Abstract sections for previous years retroactive to 1964 are available at the current rates. Microfiche for individual *STAR* issue abstract sections are not available.

TABLE OF CONTENTS

AERONAUTICS

Includes aeronautics (general); aerodynamics; air transportation and safety; aircraft communications and navigation; aircraft design, testing and performance; aircraft instrumentation; aircraft propulsion and power; aircraft stability and control; and research and support facilities (air).

For related information see also *Astronautics*.

01 AERONAUTICS (GENERAL) 1509

02 AERODYNAMICS 1513

Includes aerodynamics of bodies, combinations, wings, rotors, and control surfaces; and internal flow in ducts and turbomachinery.

For related information see also *34 Fluid Mechanics and Heat Transfer*.

03 AIR TRANSPORTATION AND SAFETY 1516

Includes passenger and cargo air transport operations; and aircraft accidents.

For related information see also *16 Space Transportation* and *85 Urban Technology and Transportation*.

04 AIRCRAFT COMMUNICATIONS AND NAVIGATION 1517

Includes digital and voice communication with aircraft; air navigation systems (satellite and ground based); and air traffic control.

For related information see also *17 Spacecraft Communications, Command and Tracking* and *32 Communications*.

05 AIRCRAFT DESIGN, TESTING AND PERFORMANCE 1519

Includes aircraft simulation technology.

For related information see also *18 Spacecraft Design, Testing and Performance* and *39 Structural Mechanics*.

06 AIRCRAFT INSTRUMENTATION N.A.

Includes cockpit and cabin display devices; and flight instruments.

For related information see also *19 Spacecraft Instrumentation* and *35 Instrumentation and Photography*.

07 AIRCRAFT PROPULSION AND POWER 1521

Includes prime propulsion systems and systems components, e.g., gas turbine engines and compressors; and on-board auxiliary power plants for aircraft.

For related information see also *20 Spacecraft Propulsion and Power*, *28 Propellants and Fuels*, and *44 Energy Production and Conversion*.

08 AIRCRAFT STABILITY AND CONTROL 1523

Includes aircraft handling qualities; piloting; flight controls; and autopilots.

09 RESEARCH AND SUPPORT FACILITIES (AIR) 1526

Includes airports, hangars and runways; aircraft repair and overhaul facilities; wind tunnels; shock tube facilities; and engine test blocks.

For related information see also *14 Ground Support Systems and Facilities (Space)*.

ASTRONAUTICS

Includes astronautics (general); astrodynamics; ground support systems and facilities (space); launch vehicles and space vehicles; space transportation; spacecraft communications, command and tracking; spacecraft design, testing and performance; spacecraft instrumentation; and spacecraft propulsion and power.

For related information see also *Aeronautics*.

12 ASTRONAUTICS (GENERAL) 1526

For extraterrestrial exploration see *91 Lunar and Planetary Exploration*.

13 ASTRODYNAMICS 1529

Includes powered and free-flight trajectories; and orbit and launching dynamics.

14 GROUND SUPPORT SYSTEMS AND FACILITIES (SPACE) 1530

Includes launch complexes, research and production facilities; ground support equipment, e.g., mobile transporters; and simulators.

For related information see also *09 Research and Support Facilities (Air)*.

15 LAUNCH VEHICLES AND SPACE VEHICLES 1531

Includes boosters; manned orbital laboratories; reusable vehicles; and space stations.

16 SPACE TRANSPORTATION 1533

Includes passenger and cargo space transportation, e.g., shuttle operations; and rescue techniques.

For related information see also *03 Air Transportation and Safety* and *85 Urban Technology and Transportation*.

17 SPACECRAFT COMMUNICATIONS, COMMAND AND TRACKING 1533

Includes telemetry; space communications networks; astronavigation; and radio blackout.

For related information see also *04 Aircraft Communications and Navigation* and *32 Communications*.

18 SPACECRAFT DESIGN, TESTING AND PERFORMANCE 1534

Includes spacecraft thermal and environmental control; and attitude control.

For life support systems see *54 Man/System Technology and Life Support*. For related information see also *05 Aircraft Design, Testing and Performance* and *39 Structural Mechanics*.

19 SPACECRAFT INSTRUMENTATION 1534
For related information see also *06 Aircraft Instrumentation* and *35 Instrumentation and Photography*.

20 SPACECRAFT PROPULSION AND POWER 1535
Includes main propulsion systems and components, e.g., rocket engines; and spacecraft auxiliary power sources.
For related information see also *07 Aircraft Propulsion and Power, 28 Propellants and Fuels,* and *44 Energy Production and Conversion*.

CHEMISTRY AND MATERIALS

Includes chemistry and materials (general); composite materials; inorganic and physical chemistry; metallic materials; nonmetallic materials; and propellants and fuels.

23 CHEMISTRY AND MATERIALS (GENERAL) 1535
Includes biochemistry and organic chemistry.

24 COMPOSITE MATERIALS 1539
Includes laminates.

25 INORGANIC AND PHYSICAL CHEMISTRY 1541
Includes chemical analysis, e.g., chromatography; combustion theory; electrochemistry; and photochemistry.
For related information see also *77 Thermodynamics and Statistical Physics*.

26 METALLIC MATERIALS 1545
Includes physical, chemical, and mechanical properties of metals, e.g., corrosion; and metallurgy.

27 NONMETALLIC MATERIALS 1552
Includes physical, chemical, and mechanical properties of plastics, elastomers, lubricants, polymers, textiles, adhesives, and ceramic materials.

28 PROPELLANTS AND FUELS 1555
Includes rocket propellants, igniters, and oxidizers; storage and handling; and aircraft fuels.
For related information see also *07 Aircraft Propulsion and Power, 20 Spacecraft Propulsion and Power,* and *44 Energy Production and Conversion*.

ENGINEERING

Includes engineering (general); communications; electronics and electrical engineering; fluid mechanics and heat transfer; instrumentation and photography; lasers and masers; mechanical engineering; quality assurance and reliability; and structural mechanics.
For related information see also *Physics*.

31 ENGINEERING (GENERAL) 1556
Includes vacuum technology; control engineering; display engineering; and cryogenics.

32 COMMUNICATIONS 1564
Includes land and global communications; communications theory; and optical communications.
For related information see also *04 Aircraft Communications and Navigation* and *17 Spacecraft Communications, Command and Tracking*.

33 ELECTRONICS AND ELECTRICAL ENGINEERING 1572
Includes test equipment and maintainability; components, e.g., tunnel diodes and transistors; microminiaturization; and integrated circuitry.
For related information see also *60 Computer Operations and Hardware* and *76 Solid-State Physics*.

34 FLUID MECHANICS AND HEAT TRANSFER 1578
Includes boundary layers; hydrodynamics; fluidics; mass transfer; and ablation cooling.
For related information see also *02 Aerodynamics* and *77 Thermodynamics and Statistical Physics*.

35 INSTRUMENTATION AND PHOTOGRAPHY 1581
Includes remote sensors; measuring instruments and gages; detectors; cameras and photographic supplies; and holography.
For aerial photography see *43 Earth Resources*. For related information see also *06 Aircraft Instrumentation* and *19 Spacecraft Instrumentation*.

36 LASERS AND MASERS 1583
Includes parametric amplifiers.

37 MECHANICAL ENGINEERING 1586
Includes auxiliary systems (non-power); machine elements and processes; and mechanical equipment.

38 QUALITY ASSURANCE AND RELIABILITY 1589
Includes product sampling procedures and techniques; and quality control.

39 STRUCTURAL MECHANICS 1589
Includes structural element design and weight analysis; fatigue; and thermal stress.
For applications see *05 Aircraft Design, Testing and Performance* and *18 Spacecraft Design, Testing and Performance*.

GEOSCIENCES

Includes geosciences (general); earth resources; energy production and conversion; environment pollution; geophysics; meteorology and climatology; and oceanography.
For related information see also *Space Sciences*.

42 GEOSCIENCES (GENERAL) 1594

43 EARTH RESOURCES 1596

Includes remote sensing of earth resources by aircraft and spacecraft; photogrammetry; and aerial photography.

For instrumentation see *35 Instrumentation and Photography*.

44 ENERGY PRODUCTION AND CONVERSION 1597

Includes specific energy conversion systems, e.g., fuel cells and batteries; global sources of energy; fossil fuels; geophysical conversion; hydroelectric power; and wind power.

For related information see also *07 Aircraft Propulsion and Power, 20 Spacecraft Propulsion and Power, 28 Propellants and Fuels,* and *85 Urban Technology and Transportation*.

45 ENVIRONMENT POLLUTION 1605

Includes air, noise, thermal and water pollution; environment monitoring; and contamination control.

46 GEOPHYSICS 1608

Includes aeronomy; upper and lower atmosphere studies; ionospheric and magnetospheric physics; and geomagnetism.

For space radiation see *93 Space Radiation*.

47 METEOROLOGY AND CLIMATOLOGY 1610

Includes weather forecasting and modification.

48 OCEANOGRAPHY 1615

Includes biological, dynamic and physical oceanography; and marine resources.

LIFE SCIENCES

Includes life sciences (general); aerospace medicine; behavioral sciences; man/system technology and life support; and planetary biology.

51 LIFE SCIENCES (GENERAL) 1615

Includes genetics.

52 AEROSPACE MEDICINE 1617

Includes physiological factors; biological effects of radiation; and weightlessness.

53 BEHAVIORAL SCIENCES N.A.

Includes psychological factors; individual and group behavior; crew training and evaluation; and psychiatric research.

54 MAN/SYSTEM TECHNOLOGY AND LIFE SUPPORT 1618

Includes human engineering; biotechnology; and space suits and protective clothing.

55 PLANETARY BIOLOGY N.A.

Includes exobiology; and extraterrestrial life.

MATHEMATICAL AND COMPUTER SCIENCES

Includes mathematical and computer sciences (general); computer operations and hardware; computer programming and software; computer systems; cybernetics; numerical analysis; statistics and probability; systems analysis; and theoretical mathematics.

59 MATHEMATICAL AND COMPUTER SCIENCES (GENERAL) N.A.

60 COMPUTER OPERATIONS AND HARDWARE 1619

Includes computer graphics and data processing.

For components see *33 Electronics and Electrical Engineering*.

61 COMPUTER PROGRAMMING AND SOFTWARE 1621

Includes computer programs, routines, and algorithms.

62 COMPUTER SYSTEMS N.A.

Includes computer networks.

63 CYBERNETICS 1623

Includes feedback and control theory.

For related information see also *54 Man/System Technology and Life Support*.

64 NUMERICAL ANALYSIS 1624

Includes iteration, difference equations, and numerical approximation.

65 STATISTICS AND PROBABILITY 1627

Includes data sampling and smoothing; Monte Carlo method; and stochastic processes.

66 SYSTEMS ANALYSIS N.A.

Includes mathematical modeling; network analysis; and operations research.

67 THEORETICAL MATHEMATICS N.A.

Includes topology and number theory.

PHYSICS

Includes physics (general); acoustics; atomic and molecular physics; nuclear and high-energy physics; optics; plasma physics; solid-state physics; and thermodynamics and statistical physics.

For related information see also *Engineering*.

70 PHYSICS (GENERAL) 1628

For geophysics see *46 Geophysics*. For astrophysics see *90 Astrophysics*. For solar physics see *92 Solar Physics*.

71 ACOUSTICS 1628
Includes sound generation, transmission, and attenuation.
For noise pollution see *45 Environment Pollution*.

72 ATOMIC AND MOLECULAR PHYSICS 1630
Includes atomic structure and molecular spectra.

73 NUCLEAR AND HIGH-ENERGY PHYSICS 1631
Includes elementary and nuclear particles; and reactor theory.
For space radiation see *93 Space Radiation*.

74 OPTICS 1632
Includes light phenomena.

75 PLASMA PHYSICS 1634
Includes magnetohydrodynamics and plasma fusion.
For ionospheric plasmas see *46 Geophysics*. For space plasmas see *90 Astrophysics*.

76 SOLID-STATE PHYSICS 1635
Includes superconductivity.
For related information see also *33 Electronics and Electrical Engineering* and *36 Lasers and Masers*.

77 THERMODYNAMICS AND STATISTICAL PHYSICS 1639
Includes quantum mechanics; and Bose and Fermi statistics.
For related information see also *25 Inorganic and Physical Chemistry* and *34 Fluid Mechanics and Heat Transfer*.

SOCIAL SCIENCES

Includes social sciences (general); administration and management; documentation and information science; economics and cost analysis; law and political science; and urban technology and transportation.

80 SOCIAL SCIENCES (GENERAL) N.A.
Includes educational matters.

81 ADMINISTRATION AND MANAGEMENT N.A.
Includes management planning and research.

82 DOCUMENTATION AND INFORMATION SCIENCE 1640
Includes information storage and retrieval technology; micrography; and library science.
For computer documentation see *61 Computer Programming and Software*.

83 ECONOMICS AND COST ANALYSIS N.A.
Includes cost effectiveness studies.

84 LAW AND POLITICAL SCIENCE 1640
Includes space law; international law; international cooperation; and patent policy.

85 URBAN TECHNOLOGY AND TRANSPORTATION 1641
Includes applications of space technology to urban problems; technology transfer; technology assessment; and surface and mass transportation.
For related information see *03 Air Transportation and Safety*, *16 Space Transportation*, and *44 Energy Production and Conversion*.

SPACE SCIENCES

Includes space sciences (general); astronomy; astrophysics; lunar and planetary exploration; solar physics; and space radiation.
For related information see also *Geosciences*.

88 SPACE SCIENCES (GENERAL) 1641

89 ASTRONOMY 1643
Includes radio and gamma-ray astronomy; celestial mechanics; and astrometry.

90 ASTROPHYSICS 1649
Includes cosmology; and interstellar and interplanetary gases and dust.

91 LUNAR AND PLANETARY EXPLORATION 1650
Includes planetology; and manned and unmanned flights.
For spacecraft design see *18 Spacecraft Design, Testing and Performance*. For space stations see *15 Launch Vehicles and Space Vehicles*.

92 SOLAR PHYSICS 1653
Includes solar activity, solar flares, solar radiation and sunspots.

93 SPACE RADIATION N.A.
Includes cosmic radiation; and inner and outer earth's radiation belts.
For biological effects of radiation see *52 Aerospace Medicine*. For theory see *73 Nuclear and High-Energy Physics*.

STUDY OF THE FEASIBILITY ASPECTS OF FLIGHT TESTING AN AEROELASTICALLY TAILORED FORWARD SWEPT RESEARCH WING ON A BQM-34F DRONE VEHICLE

D. J. Mourey 3 Sep. 1979 409 p refs

(Contract NAS1-15624)

(NASA-CR-159149) Avail: NTIS HC A18/MF A01

CSCL 01C

The aspects of flight testing an aeroelastically tailored forward swept research wing on a BQM-34F drone vehicle are examined. The geometry of a forward swept wing, which is incorporated into the BQM-34F to maintain satisfactory flight performance, stability, and control is defined. A preliminary design of the aeroelastically tailored forward swept wing is presented.

A.W.H.

ON-GOING RESEARCH PROJECTS

This is a listing of research projects - not publications

AERONAUTICS

Includes Aeronautics (general); Aerodynamics; Air Transportation and Safety; Aircraft Communications and Navigation; Aircraft Design, Testing, and Performance; Aircraft Instrumentation; Aircraft Propulsion and Power; Aircraft Stability and Control; and Research and Support Facilities (air). For Related Information See Also Astronautics.

1.0001, THERMAL-ACOUSTIC EFFECTS ON AIRCRAFT STRUCTURAL LIFE

P. Seide, University of Southern California, School of Engineering, Dept. of Civil Engineering, *3551 University Ave., Los Angeles, California* 90007 (DF143060; AFOSR-79-0013)

This work unit supports the AF mission by providing technical solutions to structural integrity problems caused by high intensity noise generated in the operation of aircraft systems. The problem area is the degradation of the structural integrity due to sonic fatigue resulting in an increased maintenance burden and expensive retrofits. Present analytical techniques do not account for high temperature effects on structural elements. The program objective is to provide analytical methods to account for high temperature effects on the dynamic response of lightweight structural elements in an intense sonic environment. The Air Force will benefit from reduced maintenance costs and increased operational useage of aircraft systems.

The effects of thermal loads combined with high intensity noise on the dynamic behavior of lightweight structural elements will be investigated. Mathematical formulations will be developed for the peak response distribution with varying membrane effects, nonlinear spring effects and multimodal effects on the structure. An analytical expression for the fatigue damage resulting from these effects will be developed. A test program will be established and conducted to verify the theoretical techniques.

SUPPORTED BY U.S. Dept. of Defense, Air Force, Flight Dynamics Lab.

1.0002, UNSTEADY VORTEX ENTRAPMENT ON AN AIRFOIL

J.E. Keesee, U.S. Dept. of Defense, Air Force, Frank J. Seiler Research Lab., *Air Force Academy, Colorado Springs, Colorado* 80840 (DF282300)

AF function - technology base, counter air, close air support. Deficiency - flight vehicles currently designed in accordance with steady flow aerodynamic characteristics do not utilize potential performance capabilities available from dynamic stall and similar unsteady separation effects. How research contributes - this effort evaluates the formation, persistence and overall influence of energetic vortices produced by unsteady airfoil motions. The work ties to and is an extension of current research by FJSRL investigators in unsteady separation. Objectives - the research seeks to determine the feasibility of trapping a vortex generator by unsteady motions near the surface of an airfoil. An assessment of the correlation of airfoil motion, vortex intensity motion and stability, and the resultant surface loading will subsequently be made. Additionally, an analytical model will be developed to describe the results. This will lead to an improved understanding of the role of the various physical mechanisms on the flow field and suggest possible improvements in flight vehicle design and maneuvering techniques.

An NACA 0012 airfoil immersed in a subsonic wind tunnel flow will be oscillated in two degrees of freedom using a microcomputer drive providing for both pitching motion and axial translation. Transient and oscillatory motions will be analyzed. Flow field parameters will be measured using a multicomponent laser Doppler velocimeter and surface pressure transducers together with a minicomputer data acquisition system. A collateral analytical effort will be directed at generating a model describing the flow field.

SUPPORTED BY U.S. Dept. of Defense, Air Force, Frank J. Seiler Research Lab.

1.0003, PENETRATION EQUATION DEVELOPMENT

W.S. Strickland, U.S. Dept. of Defense, Air Force, Armament Lab., *Eglin Air Force Base, Florida* 32542 (DF644710)

The objective of this program is to develop analytical equations for predicting the penetration of selected warhead fragment designs into aircraft fuel tanks.

The approach to this problem consists of three phases (1) an ADTC test program (2) data reduction (3) penetration equation development. The test program is designed to collect baseline data on the penetration of select warhead fragment designs into a fluid filled tank. Two orthogonal cameras will be used to photograph the fragment impact on the exterior plate. Two additional cameras will be used to photograph the fragment trajectory through the fluid. The second phase will consist of analyzing the film data to determine the impact orientation, fragment velocity, and drag coefficients for the specified fragment designs. Maximum penetration depths as a function of impact orientation, impact velocity and fragment design characteristics will be recorded. The final phase consists of formulating empirical equations for use in vulnerability models.

SUPPORTED BY U.S. Dept. of Defense, Air Force, Armament Lab.

1.0004, INTEGRATED FLIGHT/WEAPON CONTROL SYSTEM (IFWC)

W.J. Murphy, McDonnell Douglas Astronautics Co., *E. 411 St., St. Louis, Missouri* 63166 (DF143570; F33615-79-C-3604)

This work unit supports the development of proposed new weapon platform control system technologies. This program will impact the problem encountered by pilots of tactical aircraft in achieving proper launch envelopes for guided weapons. The objective is to design and test automatic and semi-automatic flight control systems which will fly the attacking aircraft to the required launch envelopes for guided weapons. This system will improve the accuracy of the weapon system, reduce pilot workload needed to launch the weapon, and increase survivability of the fighter weapon system.

The contractor will perform a literature search to establish the state of the art for this technology. He will then design an IFWC system capable of delivering both AA and AG guided weapons. Finally, he will evaluate the system using both piloted and non-piloted simulations.

SUPPORTED BY U.S. Dept. of Defense, Air Force, Flight Dynamics Lab.

1.0005, STRUCTURAL PANEL RESPONSE TO HIGH INTENSITY NOISE

C. Mei, University of Missouri, Rolla Campus, Graduate School, *103 Parker Hall, Rolla, Missouri* 65401 (DF056000; F49620-79-C-0169)

AF function - Air Force flight vehicles. Deficiency - present analysis methods, although conservative, are inaccurate regarding amplitude and frequency response. Objective - to improve analytical/predictive capability. How work contributes - extends an established method to handle complex structural panels, and correlates computation with experiment.

Apply the quasilinearization method to extend the finite element method to analyze the large deflection response of structures subject to broadband acoustic excitation.

SUPPORTED BY U.S. Dept. of Defense, Air Force, Office of Scientific Research

1.0006, DESIGN AND CONSTRUCTION OF PAVEMENTS ON EXPANSIVE SOILS (EVALUATION OF THE SWELL CHARACTERISTICS OF AIRFIELD PAVEMENT SUBGRADES)

R.G. McKeen, University of New Mexico, Graduate School, *University Hill N.E., Albuquerque, New Mexico* 87106 (177801 (HRB NO.))

Phase 2 - Provide indicator test for use in rapid swell predictions or as criteria for initiating a detailed soils investigation. Test methods considered involve measurement of the volume response of soils to moisture and load changes. Phase 3 - Provide procedures for studying in situ moisture retention force profiles and their variation with climate. Procedures are intended to produce design data. Study the load-retention force-volume relationship for various soils and the influence of chemical stabilizers on this relationship. Phase 4 -Conduct a study of airport pavement roughness already measured on some twenty runways with subgrade properties in order to quantify the influence of pavement stiffness on heave-roughness relationships.

SUPPORTED BY U.S. Dept. of Transportation, Federal Aviation Admin.

1.0007, DEVELOPMENT OF EXPERIMENTAL VIDEO MULTIPLEX METHOD FOR INTEGRATED COCKPIT DISPLAY SYSTEM

J. Moran, General Electric Co., Aerospace Electronic Systems Division, *French Rd., Utica, New York* 13502 (DN081109; N62269-79-C-0037)

To assemble a demonstration wide-band video multiplexing means for experimentation and evaluation. To use the results of this work to specify an operation system for integrated aircraft displays.

To use or modify commercially available equipment to synthesize display formats into a TV raster which is modulated out a VHF carrier. Different VHF carrier frequencies are used to accommodate the various desired display formats. All carriers are transmitted over a common line and the desired carrier is selected at the receiving end by a tunable VHF receiver.

SUPPORTED BY U.S. Dept. of Defense, Naval Air Development Center, Aircraft & Crew Systems Tech Directorate

1.0008, INVESTIGATION OF LASER SHOCK PROCESSING

S.C. Ford, Battelle Memorial Inst., *505 King Ave., Columbus, Ohio* 43201 (DF142150; F33615-78-C-3217)

This work effort supports requirements for aircraft structural integrity as documented in MIL-STD-1530A. Improved methods of increasing fatigue performance are needed to comply with these requirements. The objective of this program is to investigate laser shock processing as a technique for improving the fatigue performance of metal joints and provide basic data for selecting processing parameters. Improved fatigue performance in aircraft structure increases safety, decreases weight requirements and reduces both procurement and maintenance costs of aerospace systems.

Aluminum joint specimens will be laser shock processed and fatigue tested. Increases in fatigue initiation time and decreases in crack growth rates will be characterized. An assessment of the system requirements need for the employment of laser shock processing in the manufacture of aerospace structures will be made.

SUPPORTED BY U.S. Dept. of Defense, Air Force, Flight Dynamics Lab.

1.0009, INFLUENCE OF ENVIRONMENTAL PARAMETERS ON BIRD HABITAT SELECTION NEAR AIRFIELDS

S. Lustick, Ohio State University, Columbus Campus, School of Arts & Sciences, Dept. of Zoology, *190 N. Oval Dr., Columbus, Ohio* 43210 (DF054140; AFOSR-79-0002)

AF function - a major problem confronting military and civilian aircraft is the bird aircraft strike hazard. One billion dollars is spent worldwide on an annual basis to repair damage from bird strikes. The majority of the damaging small bird strikes is due to blackbirds and starlings. Deficiency - starlings and blackbirds pose a threat to aircraft mainly because they roost communally, fly in dense flocks when leaving and returning to the roost and feed in large flocks in open, grassy areas. A better understanding of bird behavior and ecology is needed to effectively decrease the bird aircraft strike hazard. Objective - the main objective of this effort is to study bird behavior and roost ecology by comparing three different types of blackbird and starling roost sites in order to determine how the roost affects the energetics efficiency of these species. The study should suggest alterations in the roost sites that would encourage the birds to move elsewhere. How research contributes - this research should suggest landscape alterations near airfields that would result in starling and blackbird roost relocations. Air installation compatible use zoning (AICUZ) could be affected by the resultant energetics model, thus reducing the probability of roost formation near airfields.

Vegetation height and density will be measured to topographically characterize vegetation types that are selected as nocturnal roost sites. Air temperature, humidity, precipitation, wind velocity and thermal radiation will be measured to microclimatologically characterize vegetation types that are selected as roost sites and adjacent areas not selected. Determinations will be made as to how environmental variables affect the positioning of birds within the roost. Comparison of metabolic cost within and outside the roost, as well as between roost sites will be made to determine the energetic efficiency of birds within various roost sites. Based on energetic efficiency, a model will be constructed that will provide for prediction of what a good roost site is based on topography and environmental variables.

SUPPORTED BY U.S. Dept. of Defense, Air Force, Office of Scientific Research

1.0010, AUXILIARY POWER UNIT (APU) LABORATORY

P.G. Colegrove, U.S. Dept. of Defense, Air Force, Aero Propulsion Lab., *Wright Patterson A.F.B., Dayton, Ohio* 45433 (DF458270)

To develop and operate an in-house capability to test either contractually developed APU components or develop new APU concepts, to provide quick reaction response to requests for technical assistance and problem solution from using Air Force organizations such as SPO's and other laboratories.

Build and maintain suitable laboratory facilities for conducting tests on APU components or concepts.

SUPPORTED BY U.S. Dept. of Defense, Air Force, Aero Propulsion Lab.

1.0011, TURBINE AERO-MECHANICAL ANALYSIS

K.D. Mach, U.S. Dept. of Defense, Air Force, Aero Propulsion Lab., *Wright Patterson A.F.B., Dayton, Ohio* 45433 (DF451020)

To provide data and analytical tools to aid laboratory engineers in evaluating contractor turbine engine designs (aero-thermo-mechanical) and proposals.

(NOFORN) This effort is of a continuing nature involving the origination of computer programs and updating old efforts

with new techniques. Of primary importance is the generation of realistic turbine engine performance.

SUPPORTED BY U.S. Dept. of Defense, Air Force, Aero Propulsion Lab.

1.0012, CRF/J85 TRANSIENT INVESTIGATION
F. Ostdiek, U.S. Dept. of Defense, Air Force, Aero Propulsion Lab., *Wright Patterson A.F.B., Dayton, Ohio* 45433 (DF460550)

The primary objectives of this program are to determine the effects of speed transients on compressor performance, to obtain detailed information on compressor operating paths during transient operation, and to investigate the cause of compressor performance differences between transient and steady-state operation. This information will primarily be used to evaluate transient compressor test techniques for application to APL's CRF.

A J85-5 engine will be instrumented for transient compressor testing, the instrumentation will be interfaced with a MOD COMP II computer system for storage and processing of test data. An analysis of the data will be made in order to relate specific aerodynamic parameters to changes in performance that result during transient operation that can lead to compressor stall.

SUPPORTED BY U.S. Dept. of Defense, Air Force, Aero Propulsion Lab.

1.0013, TURBINE ENGINE CONTROL SYSTEM DEVELOPMENT - IN-HOUSE
L.L. Small, U.S. Dept. of Defense, Air Force, Aero Propulsion Lab., *Wright Patterson A.F.B., Dayton, Ohio* 45433 (DF451970)

The objective of this in-house effort is twofold - to develop, fabricate and test high response turbine engine sensors so vitally necessary for advanced propulsion system control, and using this instrumentation as an input and a digital computer as processor, to develop and evaluate new control modes including optimal control techniques for the complex, multi-input and multi-output turbine engine control systems of the future.

The technical approach to this in-house effort consists of several interrelated tasks: (1) development of an analog and digital data acquisition/reduction capability for an engine test cell, (2) development, fabrication, and experimental evaluation of high response gas turbine engine sensors for possible control system applications, (3) analysis of various digital J-85 engine models and updating of these models from actual engine test data, (4) evaluation of classical control schemes with emphasis on closed loop control of unique engine parameters such as compressor discharge corrected airflow and turbine inlet gas temperature, and (5) the evaluation of modern control theory (i.e., using the state variable plant representation) as applied to actual engine control.

SUPPORTED BY U.S. Dept. of Defense, Air Force, Aero Propulsion Lab.

1.0014, ASSESSMENT OF FLIGHT DYNAMICS TECHNOLOGIES FOR LOW COST DEFENSE SUPPRESSION CRUISE MISSILE (DSCM) ALTERNATIVES
E.L. Fleeman, U.S. Dept. of Defense, Air Force, Flight Dynamics Lab., *Wright Patterson A.F.B., Dayton, Ohio* 45433 (DF144230)

The Air Force function for this effort is to assess flight dynamics technologies for low cost defense suppression cruise missile alternatives. The opportunity to be gained by this effort is the identification of unique technologies for an alternate approach to defense suppression. The objective of this effort is to provide a quantitative assessment of the effects of missile configuration alternatives on flight dynamics technologies and performance. The work contributes to laboratory planning for a balanced technology program in the area of unmanned vehicles.

An in-house design will be conducted to assess a ground-launched cruise missile utilizing a second stage rocket penetrator. Emphasis will be given to minimizing size and cost by considering a low cost turbojet engine for efficient subsonic cruise at high altitude. A second stage rocket with supersonic penetration speed will be considered for reduced reation time against a radiating target. Trade-offs will be conducted of missile size (driven by warhead size) and speed alternatives and assessments will be made of the effects on flight dynamics technologies and performance. A technical memorandum will be prepared documenting results of this effort.

SUPPORTED BY U.S. Dept. of Defense, Air Force, Flight Dynamics Lab.

1.0015, CONVECTION HEATING TECHNOLOGY FOR STRUCTURAL TESTING
G.R. Holderby, U.S. Dept. of Defense, Air Force, Flight Dynamics Lab., *Wright Patterson A.F.B., Dayton, Ohio* 45433 (DF143020)

Recent USAF aircraft have seen a large increase in the structural use of composite and plastic materials. These materials have a broad range of coefficients of absorption and reflectivity versus wave length. This has caused results of tests using standard radiation heating techniques to be questioned. The convection heating technology for structural testing will develop the in-house capability to simulate flight thermal environments using convective heating techniques. These techniques will increase the facility's flexibility in conducting thermal tests of aircraft, missiles and structural components, thereby increasing their capability for mission accomplishment.

The program effort will be directed toward designing and building test systems to enable study of convection heating and related control problems including effects of velocity, flow conditions, humidity and air temperature.

SUPPORTED BY U.S. Dept. of Defense, Air Force, Flight Dynamics Lab.

1.0016, REVISION OF FLYING QUALITIES SPECIFICATION MIL-F-8785B
D.J. Moorhouse, U.S. Dept. of Defense, Air Force, Flight Dynamics Lab., *Wright Patterson A.F.B., Dayton, Ohio* 45433 (DF143630)

This work unit supports an update of the military flying qualities requirements contained in MIL-F-8785B, Flying Qualities of Piloted Airplanes. The problem is that these requirements are not applicable to many advanced flight control concepts - the requirements must be updated to correct these deficiencies. The objectives are to 1) complete a current revision of MIL-F-8785B, and 2) continue the revisions and reformat into a prime-standard and handbook. The payoff from this effort will be a consistent set of design and flight test flying qualities requirements that will allow new and advanced technologies to be incorporated into new aircraft system developments, in order to ensure mission success without penalties caused by overdesign.

A current revision effort will be coordinated and finalized as a conversion to MIL-F-8785C. Comments received from this process will be used to plan the development of the prime-standard and the handbook. In addition, new flying qualities data from flight test, simulation or analysis will be gathered. This data will be compared with existing or proposed criteria. Existing flying qualities criteria will be validated or modified, or new ones will be formulated, for incorporation in the handbook.

SUPPORTED BY U.S. Dept. of Defense, Air Force, Flight Dynamics Lab.

1.0017, LOAD APPLICATION METHODS - COMPUTER PROGRAMS FOR THE DESIGN AND EVALUATION OF STRUCTURAL TESTING HARDWARE AND METHODS
M.D. Richardson, U.S. Dept. of Defense, Air Force, Flight Dynamics Lab., *Wright Patterson A.F.B., Dayton, Ohio* 45433 (DF142840)

A system of computer programs will be developed to support the structural testing of aerospace and other related vehicles, components and design concepts. The programs will permit efficient design and evaluation of test methods, testing fixtures and hardware. Emphasis will be placed on utilization of AFFDL/FBT computer resources currently being used only for test control and data acquisition and processing. The programs will permit project engineers not skilled in computer methods to make decisions regarding test program design and evaluation with an increased degree of confidence, thus increasing test

safety and integrity. This effort will improve AFFDL/FBT's ability to experimentally determine the structural integrity reliability of military vehicle structures and advanced aerospace structural concepts.

Three levels of computer software will be developed. Level (1) will be structured toward programmable calculator solution, level (2) interactive terminal application, and level (3) batch terminal application. The programs will use state-of-the art methods in structural analysis with emphasis on structures and elements utilized within FBT.

SUPPORTED BY U.S. Dept. of Defense, Air Force, Flight Dynamics Lab.

1.0018, ADVANCED TAKEOFF AND LANDING SYSTEMS (ATALS) TEST MACHINE DEVELOPMENT

G.R. Wyen, U.S. Dept. of Defense, Air Force, Flight Dynamics Lab., *Wright Patterson A.F.B., Dayton, Ohio* 45433 (DF143830)

This effort supports the development of advanced takeoff and landing systems for Air Force aircraft, including remotely piloted vehicles (RPV). The mobility and flexibility of current aircraft are restricted because conventional landing gear require them to be operated from prepared, vulnerable, fixed airfields. Also, current RPV launch from aircraft and parachute/helicopter recovery is expensive. Presently, laboratory test systems do not exist for the test and evaluation, and development of design and performance criteria for new advanced takeoff and landing systems (ATALS). The objective of this effort is to develop and install laboratory test systems which are most needed for the development and evaluation of new ATALS. The laboratory test facilities resulting from this effort will provide an effective, timely means to develop and evaluate ATALS which will significantly improve the performance and life cycle costs of Air Force aircraft.

Under this effort two ATALS laboratory test systems will be developed, fabricated, installed and checked out. A dynamic test machine will be placed in operation for simulating taxi, takeoff, and landing maneuvers of ATALS equipped models. And a test platform will be placed in operation for the testing of three-dimensional ATALS equipped models to establish ATALS operating characteristics during critical phases of takeoff and landing.

1.0019, AIR NAVIGATION TECHNIQUES

R.A. Leonards, U.S. Dept. of Defense, Navy, Naval Air Development Center, *Warminster, Pennsylvania* 18974 (DN081116)

To orient, guide and execute exploratory development in aircraft navigation systems and associated navigation sensors, including consolidation of separate technologies for aircraft inertial navigation and attitude heading reference into a common system, integration of functional navigation components to obtain synergistic effects, and guiding development of systems with low life cycle cost, (LCC) improved reliability and maintainability (R&M) and reduced size and weight. All of the work performed under this block directly supports problem areas addressed in OPNAV STO's and VANMAT technical strategies.

The approach includes both in-house efforts and guidance to industry to a) investigate new concepts to improve INS performance and LCC, b) deliver strapdown rate sensors with high rate capabilities, low cost, and minimal environmental sensitivities, c) develop new techniques for rapid, in air alignment of inertial systems d) test and evaluate an experimental model nuclear magnetic resonance NMR gyroscope, and e) develop advanced velocity sensors. Detailed approaches are contained in NavAirDevCen air navigation techniques block program plan for FY80 of 15 May 1979.

1.0020, RESEARCH ON MULTIPURPOSE CORROSION INHIBITORS FOR AEROSPACE MATERIALS IN NAVAL ENVIRONMENT

V.S. Agarwala, U.S. Dept. of Defense, Navy, Naval Air Development Center, Aircraft & Crew Systems Tech Directorate, *Warminster, Pennsylvania* 18974 (DN081282)

To minimize corrosion failures such as corrosion fatigue stress corrosion cracking, wear and general corrosion in naval aircraft through one process or product. To develop and formulate new multipurpose versatile inhibitors or inhibitor system which can protect high strength structural alloys steels and Al alloys from various forms of corrosion. To produce applicable methods and/or products for fleet which can be incorporated into paint primers, lubricants and surface treatment procedures.

Known mechanisms of corrosion reactions specific to naval aircraft corrosion failure problems are considered to generate few basic steps fundamental to overall corrosion controlling concepts. Each step will be studied individually and attempts will be made to develop or search chemical componds mostly inorganic as single function inhibitors to control them. The current state of the art electrochemical and metallurgical methods will be used to characterize their corrosion mitigating chemical properties. The unique aspect of this program is that the corrosion inhibiting properties of all these different chemical compounds functional inhibitors will be combined together into a formula to produce a multi-functional inhibitor of a versatile nature. The technique of phase transfer catalysis will be used to dissolve inorganic compounds into organic solvents.

SUPPORTED BY U.S. Dept. of Defense, Navy, Naval Air Development Center

1.0021, DISTRIBUTED STORE AIRLOADS

W.B. Baker, U.S. Dept. of Defense, Air Force, Arnold Engineering Development Center, *Arnold Air Force Station, Tullahoma, Tennessee* 37389 (DF629000)

Air Force function - aircraft-stores compatibility. Opportunity -structurally efficient store design and certification of stores on aircraft. Goal - development of analytical and wind tunnel techniques to obtain distributed store airloads. How work contributes - provides more accurate airloads data to improve structural design of stores and reduce flight envelope restrictions.

The approach will be to conduct pressure model and segmented store model wind tunnel tests to determine the best wind tunnel technique to obtain distributed airloads. Resulting accumulated data will be compared to the analytical results. The analytical technique will be based on the computer aided missile synthesis (CAMS) computer program. This program will be modified to calculate the airloads distributed over the store while in an interference flow field. Existing and future flow field data will be used as inputs into this modified computer program.

3.0001, ABSOLUTE REACTION AND QUENCHING RATES OF VIBRATIONALLY EXCITED HYDROXYL RADICALS BY INORGANIC AND ORGANIC MOLECULES

B.J. Finlaysonpitts, California State University & Colleges, California State University, Fullerton Campus, School of Mathematics Science & Engineering, Dept. of Chemistry, *800 N. State College Blvd., Fullerton, California* 92631 (CHE76-23577 A01)

The goal of this research is to establish the effects of reactant vibrational energy on the rates of reaction in a series of exothermic bimolecular exchange reactions in which the vibrational energy is greatly in excess of the activation energy. The investigation involves studying the physical quenching and chemical reactivity of vibrationally excited hydroxyl radicals particularly in the ninth vibrational level (v' equals 9). Reactions of OH(v' equals 9) with the following molecules are to be studied; CO, H2, HCl, HBr, HI, H2O, H2S, NH3, CH4, C2H6, and

C3H8. In addition, preliminary studies of the reactions of OH(v' equals 9) with C2-C4 olefins, benzene and toluene, which at pressures of a few torr undergo more complex addition reactions with OH(v' equals 0), will be carried out. Total rates of removal of OH(v' equals 9) will be determined in a low pressure (1 torr) fast flow discharge system; the predominant removal path - reaction and/or quenching - will be established by analysis of the yields of the major products using gas chromatography and by examination of the relative intensities of the vibration-rotation bands from 500 to 1100 nm. For those molecules whose rates of chemical reaction differ significantly from the corresponding rates for OH(v' equals 0), temperature studies (240-440 degrees K) will be performed to determine whether the excess vibrational energy changes the effective activation energy or the preexponential factor. These rate constant data will aid in developing computer models of chemical processes in the upper atmosphere, in auroras, and in comets where hydroxyl radicals have been observed. In addition, this research will clarify the reactions of vibrationally excited OH in several combustion systems where it is known to be present.

3.0002, THE STRUCTURE OF AMORPHOUS MATERIALS

A.I. Bienenstock, Stanford University, School of Engineering, Dept. of Materials Science & Engineering, *Stanford, California* 94305 (DMR73-02356 A01)

Research previously supported by NSF grant GH-40785 (DMR-7302356), will be continued and expanded. The objective of this research is the determination of atomic arrangements in amorphous materials whose structures cannot be unambiguously determined by other techniques. The main method involves measurement of the extended x-ray absorption fine structure (EXAFS) of crystalline and amorphous materials using the synchrotron radiation facility at the Stanford Linear Accelerator (SLAC). It is proposed to develop improved techniques for analysis of the EXAFS data which depends on an iterative least squares analysis in a manner analogous to that used to refine coordinates in modern x-ray diffraction structure determinations. Materials to be studied include: crystalline and amorphous germanium and selenium; germanium selenide and telluride; and alloy systems such as Tl-As-Se, Ag-AS-Se, Au-As-Se and Ga-As-Se.

3.0003, TEMPERATURE AND PRESSURE DEPENDENCE OF THE STRUCTURE OF LIQUID METALS

C.N. Wagner, University of California, Los Angeles Campus, School of Engineering & Applied Science, Dept. of Materials, *405 Hilgard Ave., Los Angeles, California* 90024 (DMR78-09929)

This is a study of the structure dependence of liquid metals as a function of temperature and pressure. The atomic arrangement of liquid state atoms is described by the interference function I(K). This quantity is used to evaluate the atomic distribution function g(r) by Fourier transformation, and is directly accessible from diffraction experiments. The interference functions I(K) will be evaluated for liquid Ga, Rb, Cs, Sn, In, Zn and Cd from the x-ray scattering patterns up to 1773 degrees K and 1 to 5 kbars pressure between room temperature and 573 degrees K. The transmission technique will be employed using monochromatic Mo-K alpha and W-K alpha radiation in conjunction with a position sensitive x-ray detection system which will provide accurate data, particularly at small scattering angles. The pressure dependence of I(K) will yield information about the applicability of the Kirkwood superposition principle required to compute the pair potential function from the atomic distribution and direct correlation functions. The interference function I(K) in the range of K equal to zero and twice the Fermi momentum can be directly correlated with the electronic transport properties of liquid metals. Lastly, using known pseudopotential form factors, the temperature and pressure coefficients of resistivity will be calculated and compared with experimental values. This is a continuation of research previously funded under NSF Grant DMR74-08532 A01. This is the first year of a two year continuing grant.

3.0004, CREEP BEHAVIOR UNDER VERY LOW STRESSES

F.A. Mohamed, University of Southern California, School of Engineering, Dept. of Mechanical Engineering & Materials Science, *3551 University Ave., Los Angeles, California* 90007 (DMR77-27619)

This is a fundamental investigation of creep behavior of metallic materials at low stress levels. In the limit of high temperatures and low stresses, polycrystalline materials deform viscously by the Nabarro-Herring mechanism. This type of deformation, which involves diffusion of vacancies through the lattice, is sensitive to grain size: the steady-state creep rate is related to 1/d2 where d is the grain size. In addition, experimental evidence reveals the existence of the Newtonian-Harper-Dorn process in some materials over the same range of temperatures and stresses. Nevertheless, the Harper-Dorn creep rates, which are not describable by a known dislocation mechanism, are independent of grain size. The objectives of this research program are: (1) to clarify the substructural features of the Harper-Dorn process; (2) to investigate the relationship between the Harper-Dorn process and Nabarro-Herring creep; and (3) to examine Harper-Dorn creep as a general process of deformation.

3.0005, EXCITED ELECTRONIC STATE RELAXATION

K.G. Spears, Northwestern University, Evanston Campus, School of Arts & Sciences, Dept. of Chemistry, *633 Clark St., Evanston, Illinois* 60201 (CHE77-14668 A02)

Dr. Spears will study energy relaxation processes in excited electronic states of molecules and atoms. The vapor phase relaxation processes include radiationless decay to other electronic states, molecular dissociation and vibrational energy transfer. Additional relaxation processes in solution phase include molecular rotation, molecular ionization, and cage effects on molecular dissociation. The methods of excited state creation will use wavelength tunable lasers in the visible and ultraviolet regions of the spectrum. Laser pulses having variable durations from picoseconds to tens of nanoseconds will provide time resolved probe capability. The probe methods include absorption and fluorescence spectroscopy as well as several types of Raman spectroscopies. This research represents a continuation of that currently supported by Foundation grant CHE-7305256.

3.0006, SIMULTANEOUS IN-SITU INVESTIGATION OF DEFECT PRODUCTION BY ELECTRON MICROSCOPY AND ELECTRICAL RESISTIVITY

M. Meshii, Northwestern University, Evanston Campus, Technological Inst., Dept. of Materials Science & Engineering, *633 Clark St., Evanston, Illinois* 60201 (DMR77-14990-A01)

This is an in-situ investigation of defect production in metals under the influence of electron and ion irradiation, using high voltage electron microscopy and electrical resistivity measurements. Both techniques will be employed to study, in depth, defect production mechanisms over wide range of temperature and defect concentrations. As a first approach, the image function and anisotropy of the displacement threshold will be determined. Initially, measurements will be made on pure face-centered-cubic and body-centered-cubic metals, including Al, Ag, Cr and Nb. The knowledge gained from this investigation is expected to contribute important basic information to on-going

studies on fundamental aspects of radiation damage in metallic materials.

3.0007, MOLECULAR COLLISION PROCESSES

D. Secrest, University of Illinois, Urbana Champaign Campus, School of Chemical Sciences, Dept. of Chemistry, *Urbana, Illinois* 61801 (CHE76-14242 A02)

Accurate approximate techniques have been developed for handling rotational energy transfer in collisions. Secrest plans to explore the use of these techniques in reducing the effort involved in other forms of energy transfer. Vibrational to translational energy transfer will be studied for atom-diatomic molecule collisions, atom-polyatomic molecule collisions and vibrational to vibrational energy transfer in molecule-molecule collisions. These calculations will be used to study experimental results and the approximations commonly used in their interpretation. In all cases rotation will be handled accurately and vibration-rotation information will be available as a biproduct of these studies. These results are needed for understanding gas lasers, the chemistry of the upper atmosphere and molecular beam scattering data. The use of molecular beam data for the determination of intermolecular potentials will be studied with emphasis on the use of polarized beams to obtain information on the angle dependence of the interaction potential. The coupled channel T matrix formalism for exchange scattering will be adapted to the study of chemical exchange reactions. In these calculations as well, it is possible to greatly reduce the computational complexity through the use of angular momentum decoupling approximations. A thorough study of these techniques in conjunction with exchange reactions will be made. This is a continuation of research currently supported by Foundation Grant, GP-16458X).

3.0008, MATERIALS RESEARCH LABORATORY

J.M. Honig, Purdue University, School of Science, Dept. of Materials & Research, *Executive Bldg., West Lafayette, Indiana* 47907 (DMR77-23798)

Major interdisciplinary research programs are carried out in four thrust areas: (1) Acousto-Optic and Acousto-Electric Research -parallel development of fundamental research on the generation, propagation, and control of phonons in materials and of engineering applications in bulk and surface acoustic wave devices. (2) Research for Elucidating Transport Phenomena in Well-Characterized Oxides -preparation, characterization, and studies of electronic and ionic structure and transport in metallic oxides. (3) Complex Semiconducting Materials and Their Behavior under Extreme Perturbation - study of the electronic and optical properties of II-VI and III-V semiconductors under extreme conditions of pressure, laser excitation, and high magnetic fields. (4) Interfaces and Heterogeneous Catalysis - theory, preparation, analysis, and applications of ion-surface interactions.

In addition a number of individual projects are carried out under the category of General Materials Research. Support is also provided for upgrading, operation, and maintenance of a range of central facilities with emphasis on materials preparation, optics, and X-ray analysis.

This award is a continuation of DMR76-00889 A01.

3.0009, ELECTRONIC STRUCTURE, ENERGY TRANSFER, AND LUMINESCENT PROPERTIES OF LANTHANIDE IONS IN OCTAHEDRAL SYMMETRY

R.W. Schwartz, Louisiana State University, Agricultural & Mechanical College, School of Chemistry & Physics, Dept. of Chemistry, *University Station, Baton Rouge, Louisiana* 70803 (DMR78-11540)

Design of materials that are efficient lumophors (phosphors and fluorescent materials), lasers, and energy transfer or energy up-conversion systems is, to a large extent, an empirical process. Desired atomic properties in these materials are long excited state lifetimes and efficient photoemission, both of which have been observed in the compounds Cs2NaLnC16 (Ln equals trivalent lanthanide). These two properties are determined by the electronic states of the lanthanide ions and the interactions of these states with structural features, for example the type and geometrical arrangement of ligands (C1,...) bonded to the lanthanide. As a step toward understanding these interactions, single crystals of Cs2NaLnC1 and its analogs are being studied with respect to: the structural phase transition that occurs in certain members of the series; electronic structure of the lanthanide ions at the unique, six-coordinate, octahedral site; and, electron-phonon interactions. The experimental procedure involves measurement of the temperature and concentration dependence of the electron paramagnetic resonance; optical absorption and magnetic circular dichroism; emission; and magnetic circularly polarized emission.

3.0011, MOLECULAR MECHANICS OF CHEMICAL REACTIONS

D.R. Herschbach, Harvard University, Cambridge Campus, School of Arts & Sciences, Dept. of Chemistry, *Cambridge Station, Cambridge, Massachusetts* 02138 (CHE76-12274 A02)

A three-year program of experimental and theoretical studies of the dynamics of simple chemical reactions, inelastic energy transfer, and 'quasi-liquid' interaction is planned. The major experimental projects include: (1) reactions and inelastic scattering of van der Waals molecules; (2) analysis of angular momentum disposal by means of laser-induced fluorescence; (3) solvation of solute molecules in small solvent clusters probed by laser-induced fluorescence; (4) an attempt to produce beams of solvated electrons and to measure the electron affinity of small clusters of water and ammonia molecules in collisions with hyperthermal alkali atom beams; (5) study of reactions and diffusion processes on coated surfaces, including vibrational excitation of incident molecules, stimulated surface ionization, and stimulation of membrane systems. Theoretical studies include several approaches to the analysis or prediction of vector properties of reactions, particularly by means of classical trajectory calculations, impulsive and statistical models and information theory methods. Also planned is a large-scale electronic structure calculation to obtain an accurate potential energy surface for bond exchange among three hydrogen molecules. This work is a continuation of that currently supported by Foundation grant MPS7102601 (GP-27622X).

3.0012, FUNDAMENTALS OF DIRECTIONAL SOLIDIFICATION

M.C. Flemings, Massachusetts Inst. of Technology, School of Engineering, Dept. of Materials Science & Engineering, *77 Massachusetts Ave., Cambridge, Massachusetts* 02139 (DMR78-10905)

This is an advanced phase of a basic investigation on fundamentals of directional solidification. The objective of the current

work is to delineate the mechanism(s) responsible for obtaining homogeneous structures in rapidly solidified metals. Secondary objectives are to compare structure fineness and segregation with existing theory and to delineate areas where extension of existing theory is required. Materials employed are model alloys of constant partition ratio 'k' (such as Al-Cu alloys) and materials with a retrograde solidus (such as Zn-Cd). Techniques will be employed in achieving rapid solidification (10 to the 4th power-10 to the 8th power degrees C/sec) that: (a) require nucleation, such as 'splat cooling', and (b) do not require nucleation, such as 'layer glazing'. Structure and structural homogeneity will be determined quantitatively as a function of cooling rate. Results of critical experiments performed will delineate and distinguish the basic mechanism(s) important for achieving homogeneity. It is hypothesized that one or more of the following mechanisms is responsible for the homogeneity obtained in rapidly solidified metallic materals: (1) depression of the homogeneous nucleation temperature; (2) nucleation substantially below the liquidus temperature but above the temperature usually assumed to be the homogeneous nucleation temperature; (3) solute building in front of the growing interface; and (4) nonequilibrium interface kinetics. It is expected the results of this investigation will define the specific mechanism(s) and the conditions, necessary and sufficient, to achieve homogeneous structures in select rapidly solidified metallic systems. This program is an extension of research, previously funded by NSF Grant DMR76-21551. This is the first year of a three-year continuing grant.

SUPPORTED BY U.S. National Science Foundation,

3.0013, INFRARED AND OPTICAL DOUBLE RESONANCE SPECTROSCOPY

J.I. Steinfeld, Massachusetts Inst. of Technology, School of Science, Dept. of Chemistry, *77 Massachusetts Ave., Cambridge, Massachusetts* 02139 (CHE77-08323 A01)

In this program, Dr. Steinfeld will continue research on coherent transient and double resonance spectroscopy in the infrared and microwave regions, and extend these techniques into the visible portion of the spectrum. The infrared and microwave experiments will focus chiefly on those systems which will help to clarify interpretation of the results in terms of molecular inelastic processes, with particular emphasis on HCN. Other experiments will be directed toward rotational identification of transitions pumped by infrared lasers in asymmetric rotors such as vinyl halides and methanol.

In the visible-U.V. region, coherent transient and double resonance experiments will be carried out using the dye laser facility in the M.I.T. Spectroscopy Laboratory. Stark-switching methods will be used to generate nutation, echo and other multiple-pulse transients in electronically excited states of polar molecules, permitting measurement of the state dependence of T1 and T2 relaxation times. These methods will be applied to the analysis of congested spectra by Fourier Transform methods. In addition, I.R.-visible double resonance will be used in the study of the electronic spectra of infrared multiphoton states.

This research represents a continuation of that currently supported by Foundation grant CHE-76-11361.

Directorate for Mathematical & Physical Sciences, Div. of Chemistry

3.0014, MAGNETIC INTERACTIONS AND PHASE TRANSITIONS OF POLYMERIC TRANSITION METAL COMPLEXES

W.M. Reiff, Northeastern University, School of Liberal Arts, Dept. of Chemistry, *360 Huntington Ave., Boston, Massachusetts* 02115 (DMR78-12191)

In the first area of interest, new linear and distinctly nonlinear zig-zag chain polymeric transition metal complexes are studied as part of a search for unusual manifestations of low dimensionality magnetic behavior. A primary goal in this work is systematic investigation of the effects of variation of intrachain superexchange as transmitted by a variety of polyatomic ligands on overall three-dimensional magnetic ordering.

The second area of interest includes: (a) cooperative, reversible order-disorder transitions of complexes; (b) reversible displacive transitions along a transition metal-organic ligand polymer chain; and, (c) irreversible temperature dependent changes of coordination number and geometry in the solid state.

The most important measurements are of field and temperature dependence of Mossbauer spectra, and magnetization of powders and crystals over the ranges 0 to 210kG and 1.5 to 400K respectively.

This is the first year of a three-year continuing grant.

This is a continuation of research supported under DMR 75-13592.

SUPPORTED BY U.S. National Science Foundation,

3.0015, THEORETICAL STUDIES OF POSITRON/MOLECULE SYSTEMS AND THEIR ANNIHILATION

P.E. Cade, University of Massachusetts, Amherst Campus, School of Arts & Sciences, Dept. of Chemistry, *Amherst, Massachusetts* 01002 (CHE77-08542 A01)

Dr. Cade will study the electronic structure of positron/molecule systems, which are chemical entities with very short lifetimes (about 10 to the minus 9th power sec) and hitherto unstudied properties. The major thrust of this research is to establish the existence (or not) of these unusual new species. The methods of quantum chemistry with extension to special requirements for positrons will be employed in these theoretical studies. Several investigations are planned: (1) Benchmark studies of small molecules such as (H anion; positron) and (Li; positron) with state-of-the-art theoretical methods. (2) The construction of computer programs and calculations on simple molecular-ion/positron systems such as (OH anion; positron), (CN anion; positron), and (N3 anion; positron) within the Restricted Hartree-Fock approximation. (3) Consideration of simple neutral-molecule/positron systems such as (O2; positron), (H2O; positron), (NH3; positron), etc; (4) Exploratory calculations on larger, chemically more interesting, molecule/positron systems using minimal STO basis set calculations (via Gaussian basis sets) within the Roothaan-Hartree-Fock theory. A central feature of these investigations will be a consideration of the annihilation characteristics of these molecule/positron systems. This research represents a continuation of that currently supported by Foundation grant CHE-7610117.

SUPPORTED BY U.S. National Science Foundation,
Directorate for Mathematical & Physical Sciences, Div. of Chemistry

3.0016, MICROSTRUCTURE AND PROPERTIES OF POWDER-PROCESSES ALUMINUM- LITHIUM ALLOYS

S.M. Sastry, McDonnell Douglas Corp., *P.O. Box 516, St. Louis, Missouri* 63166 (DF054940; F49620-79-C-0039)

AF function - the use of Al-Li alloys in aerospace structures provides the potential for weight and life-cycle-cost reductions. Opportunity - additions of Li to Al, Al-Cu and Al-Mg alloys have resulted in a considerable improvement of strength/weight and stiffness/weight ratios, with each weight per cent Li resulting in a 3 per cent reduction in density and a 6 per cent increase in Young's modulus. Alloys based on the Al-Li system are thus capable of developing unique and attractive combinations of high specific strength (10 per cent increase) and high specific modulus (10 per cent increase), thereby enabling potential weight savings in aircraft structural members. Objective - this research provides a systematic investigation of deformation and fracture characteristics of Al-Li alloys to identify beneficial alloying elements and microstructures, and to provide guidelines for the systematic development of rapid quenching and powder metallurgical methods for producing Al-Li alloys. A potential exists for improvements in the ductility and toughness of Al-Li alloys by the slip homogenization that can be effected by grain refinement and by ancillary element additions to provide a controlled dispersion of incoherent dispersoids. How work contributes - Al-Li alloys can provide significant weigh savings and life-cycle-cost reductions compared with existing aluminum alloys and composite materials in forward and aft fuselage structures and upper wing covers. Li-containing aluminum alloys

presently processed by conventional casting methods have unacceptable ductility and toughness.

The program is divided into three phases. In Phase I, a systematic investigation of modifications in microstructures and properties effected by rapid quenching and addition of ancillary alloying elements to binary Al-Li alloys will be conducted. In Phase II, the optimum ancillary alloying elements selected from Phase I will be added to Al-Cu-Li, Al-Mg-Li, and Al-Zn-Mg-Cu-Li alloys, and alloy powders will be produced as flakes and spherical powders by three different rapid-solidification techniques. The properties of the alloys as influenced by the powder type, consolidation and processing parameters will be studied. In Phase III, a detailed investigation will be conducted of microstructures, tensile properties, fracture toughness, creep, fatigue, and corr (Text Truncated - Exceeds Capacity)

3.0017, MOSSBAUER EFFECT STUDIES IN SOLID STATE CHEMISTRY

R.H. Herber, Rutgers the State University of New Jersey, New Brunswick Campus, School of Chemistry, Dept. of Chemistry, *Old Queens Bldg., New Brunswick, New Jersey* 08903 (DMR78-08615)

Research is being carried out in three related but distinct areas: lattice dynamics and vibrational anisotropy studies, structure and bonding in organotin compounds, and structure and bonding in solids containing Sn(II).

The first area involves study of the effect of radiation damage -especially that due to the formation of fission fragments - in a uranium-tin alloy in an attempt to elucidate the relationship between fission fragment damage and lattice temperature of the solid. Detailed lattice dynamical studies in the systems M2FeO4 and M Fe(Cn)5NO.nH2O are designed to examine the vibrational integrity of the Fe(VI)O4-- and Fe(II)(CN)5NO moieties, respectively. Other work involves a lattice dynamical study of NbS2.Sn and NbS2.Sn1/3 in order to gain a better understanding of van der Waals layer compound lattices.

The second area is concerned with the structure, bonding, and lattice dynamical properties of polynuclear organometallic compounds as related to further tests of the effective vibrating mass (EVM) model of intermolecular bonding forces.

The third area is concerned with the relationship between stoichiometry, solvation, and stereochemistry in a new class of tin (II) compounds with cyclic polyethers.

This is a continuation of work supported by DMR 76-00139. This is the first year of a three-year continuing grant.

H.H. Johnson, Cornell University, Ithaca Campus, Materials Science Center, Dept. of Materials Science & Engineering, *Ithaca, New York* 14850 (DMR76-81083 A01)

The award will support the continuation of major research programs on phase transitions, mechanical properties, surface science, optical phenomena, defect structures, and new solid state materials. In addition extensive experimental facilities will be partially supported, as well as some research of exploratory nature, directly or partly related to the major concentration areas.

This award is a continuation of DMR76-01281.

SUPPORTED BY U.S. National Science Foundation, Directorate for Mathematical & Physical Sciences, Div. of Materials Research

3.0019, DIFFRACTION STUDIES OF THE STRUCTURE OF GRAIN BOUNDARIES

S.L. Sass, Cornell University, Ithaca Campus, School of Engineering, Dept. of Materials Science & Engineering, *242 Carpenter Hall, Ithaca, New York* 14853 (DMR76-24180 A01)

This is a continuation and extension of studies on the detailed nature of grain boundaries in metallic materials. Investigations underway include diffraction studies of: (i) the structure of high angle twist boundaries in Au; (ii) segregation to grain boundaries; and (iii) the surface structure of thin films. The results from the twist boundary study will be used to assess computer models of general grain boundaries. The research underway is designed to provide a detailed understanding of the atomic structure of grain boundaries both in the presence and absence of solute atoms. The knowledge gained is expected to enhance understanding of the influence of grain boundaries on properties of metallic materials. This is a continuation of NSF grant DMR76-24180.

SUPPORTED BY U.S. National Science Foundation, Directorate for Mathematical & Physical Sciences, Div. of Materials Research

3.0020, EFFECTS OF SINTERING CONDITIONS AND COMPOSITION ON PROPERTIES OF PEROVSKITE-STRUCTURE OXIDES

D.M. Smyth, Lehigh University, Materials Research Center, *Alumni Memorial Bldg., Bethlehem, Pennsylvania* 18015 (DMR78-20072)

Ternary oxides having the perovskite structure have found major applications as ferroelectric capacitor dielectrics, piezoelectric transducers, and electrooptic materials. Their critical properties have been found to be extremely sensitive to processing details and to impurity content. Previous work on the defect chemistry of polycrystalline barium titanate and strontium titanate has produced a foundation of understanding and experimental techniques which has led to this study of the chemistry of the high temperature processing steps and the mode of impurity incorporation in the perovskite-structure titanates. This will involve an investigation of the amount of excess rutile incorporated as a function of impurity content and processing parameters. It will also include a study of the site-preference of selected trivalent impurities as a function of processing conditions. In the course of this program, the ability to prepare samples of precisely known composition has been demonstrated, and the high temperature, equilibrium conductivity measurement has been refined to give an accurate, geometry-independent measurement of the net amount of excess rutile and acceptor impurity in solid solution. As a supplement to the latter technique, electron paramagnetic resonance spectroscopy will be investigated as a supplemental means of identifying the lattice site occupation of specific impurities as a function of the conditions prevailing during the incorporation step.

This is a renewal of NSF Grant DMR74-21095 A02.

SUPPORTED BY U.S. National Science Foundation, Directorate for Mathematical & Physical Sciences, Div. of Materials Research

3.0021, MOLECULAR BEAM KINETICS - LASER AUGMENTED STUDIES

R.B. Bernstein, University of Texas, Austin Campus, School of Natural Sciences, Dept. of Chemistry, *200 W. 21st St., Austin, Texas* 78712 (CHE77-11384 A01)

A basic research program in the field of molecular reaction dynamics is to be carried out. A number of elementary chemical reactions involving neutral reagents are to be studied in detail. The goal is to gain quantitative dynamical information such as state-to-state differential reaction cross sections, suitable for comparison with theory. An important question is the efficacy of internal excitation of a reagent molecule in promoting its reactivity, compared to that of the relative translational energy of the colliding reagents. The principal tool to be employed is the crossed molecular beam scattering technique, augmented by the use of tunable lasers coupled to the reactive scattering of vibrationally excited reagent molecule beams (e.g., HCl), and analogous experiments with electronically excited reagents, e.g., Hg(63Po) and 2; laser excitation studies with oriented molecule beams (e.g., CH3F); and selective detection of internally excited molecules (nascent reaction products). Associated theoretical-computational studies are also to be carried out. Such fundamental knowledge at the 'micro' level can serve as a guide to future research at the 'macro' level in the field of laser-induced chemistry. This research represents a continuation of that for-

merly supported at the University of Texas at Austin by Foundation grant CHE-7304940.

3.0022, ENERGETICS OF POLYMER CRYSTALLIZATION

B.L. Farmer, Washington State University, School of Engineering, Dept. of Materials Science & Engineering, *Pullman, Washington* 99163 (DMR77-20604)

The technique of energetics analysis - computerized molecular model building and evaluation - has been applied to a variety of questions relevant to the structure and properties of semicrystalline polymeric materials. This study deals with an investigation into several aspects of polymer crystallization using this same technique. Specific problems to be examined include the geometrics and energetics of the association of a chain segment on the crystal growth face, as well as the energetics involved in the movement of such a chain on the growth face, of the molecular folding process, of an orderly arrangement of chain folds into a regular surface, and of association of molecules with the fold surface. In order to focus the computational effort on the problems of interest, the calculations will simulate linear polyethylene, because of its relatively simple structure. In addition, experimental investigation of the cocrystallization of polyethylene and lightly chlorinated polyethylene will explore the role of a kinetic adsorption process in polymer crystallization. This study promises to further our knowledge and understanding of the molecular processes influencing polymer crystallization, especially when undertaken in the context of the already available wealth of experimental data and theoretical treatments.

ENGINEERING

Includes Engineering (general); Communications; Electronics and Electrical Engineering; Fluid Mechanics and Heat Transfer; Instrumentation and Photography; Lasers and Masers; Mechanical Engineering; Quality Assurance and Reliability; and Structural Mechanics. For Related Information See Also Physics.

4.0001, TURBINE ENGINE LOW ASPECT RATIO TECHNOLOGY

P.R. Dodge, Garrett Corp., *402 S. 36th St., Phoenix, Arizona* 85034 (DF456730; F33615-74-C-2017)

This program extends the successful technology of AF contract F33615-68-C-1208 to low aspect ratio turbine blade problems, especially for high temperature cooled blades.

A time phased effort to identify the loss mechanisms of low aspect ratio cooled turbines will be pursued. Cold stationary and rotating rigs will be used to verify loss mechanisms and evaluate methods to reduce these losses. The approach to this improvement is expected to extend the work of F33615-68-1208.

SUPPORTED BY U.S. Dept. of Defense, Air Force, Aero Propulsion Lab.

4.0002, MIXED FLOW COMPRESSOR

J.L. Dodge, Signal Co. Inc., Airesearch Manufacturing Company, *402 S. 36th St., Phoenix, Arizona* 85034 (DF459910; F33615-79-C-2028)

Design, development and demonstration of a single stage mixed flow compressor that exhibits performance equivalent to todays state-of-the-art multi-stage axial compressor at substantially lower cost.

The program includes mechanical design and development in parallel with aerodynamic design of a single stage mixed flow compressor. Complete mapping of the compressor under simulated engine test conditions would follow the fabrication phase.

SUPPORTED BY U.S. Dept. of Defense, Air Force, Aero Propulsion Lab.

4.0003, THE STRUCTURE OF TURBULENT VELOCITY FIELDS

F.H. Champagne, University of Arizona, Graduate School, *Tucson, Arizona* 85721 (DF055190; F49620-79-C-0224)

AF function - advanced aerospace vehicles. Opportunity - increased understanding of turbulence and turbulent velocity fields in diffusing and jet augmented flows. Objective - investigate the origin and evolution of puffs in relaminarizing flows and the structure of wakes and jets in co-flowing streams with pressure gradients. How work contributes - a better understanding of the turbulence relaminarization in ducts and the effects of downstream pressure gradient on the persistance of wakes and the mixing of co-flowing streams is directly applicable to many applications of interest to the Air Force in the design of advanced aerospace vehicles, namely, high speed diffusers, jet pumps and augmentors and combustion systems.

An experimental program will be pursued to study the origin and evolution of turbulent puffs in relaminarizing pipe flow. Data on the development of the puffs will be obtained using upstream flush mounted hot wire probes and an array of 10 hot wires panning the radius of the pipe at the exit plane. Investigation of wakes and jets with various downstream pressure gradients will be undertaken in a low turbulence wind tunnel being installed at the University of Arizona.

SUPPORTED BY U.S. Dept. of Defense, Air Force, Office of Scientific Research

4.0004, ELECTRET TAPE SENSOR DEVELOPMENT

G.K. Miller, GTE Sylvania Inc., *Mountain View, California* (DF738980; F30602-78-C-0320)

The objective of this effort is to investigate and demonstrate a technique for the development of a line sensor that can be applied like tape to fences, interior and exterior building walls, aircraft skins, etc. The concept to be demonstrated is basically an active ultrasonic Doppler system using electret layers in the tape as radiating and receiving elements.

The results of previous work recommended that a dual system comprised of two electret strips fabricated on one substrate would be the most advantageous configuration for long transducer lengths. The approach for achieving the objective will be as follows: A) Identify the optimum design for the dual system configuration. B) Fabricate samples of the design considered optimum and measure radiation and receiving performance of this design. C) Modify the design based on the results obtained and have a laminates manufacturer fabricate long samples for evaluation and delivery. D) Based on the final transducer design, design and fabricate the driving and receiving electronics which will then be integrated with the transducer.

SUPPORTED BY U.S. Dept. of Defense, Air Force, Rome Air Development Center

4.0005, ELECTRON TRANSPORT IN ULTRA-THIN HETEROJUNCTIONS

P.D. Depkus, Rockwell International Corp., *3370 Miraloma Ave., Anaheim, California* 92803 (DN875608; N00014-78-C-0711)

Advancing the capability of Navy electronics systems required understanding of the properties of newly developed materials and their application to new electron device geometries. Ultra-thin heterojunctions in gallium arsenide and gallium aluminum arsenide can now be fabricated and their electronic transport properties must be investigated to verify their device potential.

Thin heterojunction devices will be fabricated by the metal-organic chemical vapor deposition (MO-CVD) technique. 50 to 1000 angstrom layers of gallium arsenide will be sandwiched between high resistivity gallium aluminum arsenide layers with abrupt change in composition at the junctions. Electron transport measurements will be made on the properties of the device for current flow parallel and perpendicular to the junctions. These will include C-V, I-V, DC conductance and Hall voltage measurements, in order to determine carrier concentration, mobility, and resistivity as a function of temperature, doping concentration, difference in bandgap between the two materials, and the layer thickness. Because of the thinness of the GaAs layer, carriers are quantized in the direction perpendicular to the junctions. The device properties will be investigated in

terms of this quasi-two-dimensional density of states and the energies of the resulting subbands in this quantum well. Initially, studies will concentrate on properties of a single well and later will be extended to multilayer structures for investigation of superlattice concepts.

SUPPORTED BY U.S. Dept. of Defense, Navy, Office of Naval Research

4.0006, REFURBISHMENT AND ENGINEERING SUPPORT OF RECOVERED ATTITUDE CONTROL SYSTEM AND UPDATING OF MIDAS PLATFORM LOGIC
E. Foglesong, Space Vector Corp., *Northridge, California* (DF248080; F19628-76-C-0278)

AF function - direct support of aerospace environmental research measurements program. Deficiency - lack of knowledge of rocket attitude control and behavior. Objective - to provide the Air Force with a refurbished, reliable, accurate and low cost attitude control system (ACS) and MIDAS platform for sounding rockets. How research contributes - contributes significantly to the cost-effectiveness and scientific utility of rocket-borne payloads which probe the aerospace environment.

Refurbish recovered rocket-borne attitude control systems and provide ancillary engineering and launch support services. Additionally, update MIDAS platform electronic logic and retrofit into existing systems.

SUPPORTED BY U.S. Dept. of Defense, Air Force, Geophysics Lab.

4.0007, CLOSURE RELATIONS IN FLUID MECHANICS
D. Baganoff, Stanford University, School of Engineering, Dept. of Aeronautics & Astronautics, *Stanford, California* 94305 (ENG75-15230)

Purpose of this research project is to apply a closure scheme for the solution of the Boltzmann equation for shock-wave structure. Particular attention will be focused on implications of the operations of straining and shifting in velocity space and the physical consequences of the continuum interpretation of these closure relations. Complete shock-wave structure computations will be carried out starting with the 13-moment equations. Direct comparisons will be made of the fluid dynamic variables with purely numerical solutions to the same shock structure problem.

SUPPORTED BY U.S. National Science Foundation, Directorate for Engineering & Applied Science

4.0008, BASIC STRUCTURE AND PROPERTIES OF TURBULENT SHEAR FLOWS
S.J. Kline, Stanford University, School of Engineering, Dept. of Mechanical Engineering, *Stanford, California* 94305 (DF053840; F49620-79-C-0010)

AF function - advanced airbreathing propulsion devices. Opportunity - increase understanding of the basic flow structure and computational ability for turbulent shear flows. Objective - increase understanding of basic flow structure of separating and separated flows. Study of effect of wall curvature on these flows and also on heat transfer will be made. How work contributes - improvement in both physical understanding and prediction ability will permit better design of any system (jet engines, turbine blades, diffusers, airfoil sections) in which these flows become limiting or controlling factors.

A combined experimental and theoretical program on turbulent shear flows has been established. Studies will be made of unseparated, separating and fully separated flows. Examination of transitory and fully stalled flows in diffusers will be accomplished. The effect of wall curvature on turbulence structure function and heat transfer will also be studied.

SUPPORTED BY U.S. Dept. of Defense, Air Force, Office of Scientific Research

4.0009, F100 NON-RECOVERABLE STALL INVESTIGATION
Unknown, Systems Control Inc., *260 Sheridan Ave., Palo Alto, California* 94306 (DF463970; F33615-79-C-2048)

To investigate the F100 non-recoverable stall phenomena and to develop working models that will duplicate the engine signature during non-recoverable stall.

Existing data from AEDC shall be analyzed for information content, data quality. Analytical models shall be developed from existing engine simulations and AEDC stall data.

SUPPORTED BY U.S. Dept. of Defense, Air Force, Aero Propulsion Lab.

4.0010, EXPERIMENTAL INVESTIGATION OF COMPRESSOR ROTOR WAKES
R.P. Dring, United Technologies Corp., Research Labs, *400 Main St., East Hartford, Connecticut* 06108 (DF461860; F33615-77-C-2083)

The objective of this effort is to obtain experimental data which would improve the modeling of secondary flows incorporated in current through-flow axial compressor design systems.

Obtain accurate, detailed circumferential radial, and axial distributions of total and static pressure and the three components of the flow velocity downstream of a rotating axial compressor rotor.

SUPPORTED BY U.S. Dept. of Defense, Air Force, Aero Propulsion Lab.

4.0011, VARIABLE GEOMETRY COMBUSTOR DEVELOPMENT
Unknown, United Technologies Corp., Pratt & Whitney Aircraft Group, *P.O. Box 2691, West Palm Beach, Florida* 33402 (DF462730; F33615-78-C-2043)

Design and develop a variable geometry combustor for optimized performance and emissions over its full operating range. A full annular demonstration will be developed to substantiate design interest and establish performance capabilities and limitations.

Conduct detailed component design, experimental analysis and full scale demonstrator development. Control techniques to be studied will include flow splitting and primary and secondary mixing controls.

SUPPORTED BY U.S. Dept. of Defense, Air Force, Aero Propulsion Lab.

4.0012, RESOC (RESEARCH ON SONOBUOY CONFIGURATIONS) REMOTE FUNCTION CONTROL
R. Wager, Magnavox Government & Industrial Electronics Co., *1313 Production Rd., Fort Wayne, Indiana* 46808 (DN981000; N62269-78-C-0369)

To determine the feasibility of selection depth, life, and channel of a sonobuoy during flight. This work supports work unit ZU701, Agency Accession No. DN 681083.

Develop a hand held control to interface with the sonobuoy for on the ground selection in addition to selection on the aircraft.

SUPPORTED BY U.S. Dept. of Defense, Naval Air Development Center, Sensors & Avionics Tech Directorate

4.0013, LASER VELOCIMETER MEASUREMENTS & ANALYSIS IN TURBULENT & MIXING FLOWS
H.D. Thompson, Purdue University, Purdue Research Foundation, *Life Sciences Bldg., West Lafayette, Indiana* 47907 (DF461070; F33615-77-C-2010)

To experimentally and analytically investigate the biasing of individual realization LDV signal and to investigate the feasibility of the use of fluorescent dye tracers in the study of mixing and turbulence.

The effort shall include the further development of existing turbulence and mixing models, the identification of the LDV signal biasing associated with the models and the development of carefully controlled experiments to measure the biases in

actual flows. A suitable experiment shall be defined and carried out to determine the feasibility of the use of fluorescent dye tracers in the study of mixing and turbulence.

SUPPORTED BY U.S. Dept. of Defense, Air Force, Aero Propulsion Lab.

4.0014, ADVANCED STRAIN GAUGE PRESSURE TRANSDUCER
Unknown, Gould Inc., Chesapeake Institute Division, *6711 Bay Meadow Dr., Glen Burnie, Maryland* 21061 (DF463040; F33615-78-C-2064)

To test and evaluate the impact of an improved strain gauge deposition process and lead-wire attachment technique on the operation of strain gauge pressure transducers used in gas turbine engine control and diagnostic systems.

Three phases: (1) bench test new strain gauge approach to validate operation and durability, (2) implement in a pressure transducer and evaluate performance, (3) piggyback engine test transducers to judge operational suitability.

SUPPORTED BY U.S. Dept. of Defense, Air Force, Aero Propulsion Lab.

4.0015, RECOGNITION OF MOVING OBJECTS USING ONE VISUAL SENSOR
A.A. Desrochers, Boston University, School of Engineering, Dept. of Systems Engineering, *755 Commonwealth Ave., Boston, Massachusetts* 02215 (DF054310; AFOSR-79-0039)

AF function - reconnaissance. Deficiency - inability to process images in a timely fashion. Objective-develop methods of recognizing moving aerial objects. How work contributes - reinforce conjecture that some regions of targets are informationally richer than others and that shape recognition is a hierarchical process.

Investigate transformations of moment invariants including the theory of algebraic invariants that apply to recognition of aircraft. Develop algorithms for classifying regions of an object that are silhouette invariant. Identify further topics for research in region analysis techniques, aspect invariant shape descriptions, and algorithms for processing moving images.

SUPPORTED BY U.S. Dept. of Defense, Air Force, Office of Scientific Research

4.0016, AUDIO AVIONICS CONTROL/STATUS SYSTEM
L.A. Sorenson, Semcor Inc., *1500 N. Kings Hwy., Cherry Hill, New Jersey* 08034 (DN081138; N62269-79-C-0009)

Generation of a functional configuration governing the implementation of an audio avionics control and status system. The configuration is to define an overall aircraft avionics system which will enable the implementation of voice recognition and synthesis equipment as part of the overall avionics system configuration. This contracted effort supports work unit ZC101, Agency Accession DN 081123.

Study and analysis analyze modern day avionics system implementation multiplex data bus control status audio signals and trends then couple this with present and future VRAS technology projections for generation of a configuration which will allow for the incorporation of such technology VRAS when available.

SUPPORTED BY U.S. Dept. of Defense, Naval Air Development Center, Communication Navigation Tech Directorate

4.0017, BOUNDARY LAYER TRANSITION AND PARTICLE INDUCED HEATING IN HYPERSONIC FLOW
M.S. Holden, Calspan Corp., *1422 Genesses Ave., P.O. Box 235, Buffalo, New York* 14221 (DF053750; F49620-79-C-0003)

AF function - advanced aerospace vehicles. Deficiency - the predictive capability for boundary layer transition and for particle-induced heating on reentry vehicles is inadequate. Objective - to provide evidence leading to the development of a greater understanding of the gross features of the initial formation and growth of turbulent instabilities in the transition region of a hypersonic boundary layer. Also, to develop methods to predict the magnitude of particle-induced heating augmentation of hypersonic vehicles traveling in a dusty environment. How work contributes - once the relationships among geometry, ambient flow conditions, heating rates, and flow instabilities become better understood, rational engineering design methods can be developed to optimize the thermal protection and aerodynamic performance of reentry vehicles.

In the study of transition, high speed Schlieren photographs of the formation and development of instabilities in a laminar boundary layer, obtained with a camera capable of framing rates of up to 100,000 frames per second, will be correlated with the outputs from high frequency thin film gages mounted in the transition region of sharp and blunted cones at Mach numbers from 11 to 13. The characteristics of the regular instabilities observed upstream of transition and the formation and development of the turbulent bursts will be determined. In a previous experimental program, detailed heat transfer and pressure measurements were made to explore the various fluid dynamic mechanisms of key importance in particle induced heating augmentation. Based on this extensive data, the present program will develop models to describe the various interactions resulting in enhanced heating thereby generating methods to predict the heating resulting from single and multiple particle interactions.

SUPPORTED BY U.S. Dept. of Defense, Air Force, Office of Scientific Research

4.0018, ANALYSIS FOR MULTISTATIC GEOMETRIC IMAGE CORRECTION
R. Van Deusen, Cutler Hammer Inc., Ail Division, *Comac Rd., Deer Park, New York* 11729 (DF920440; F30602-79-C-0137)

Objective, to solve the problem of geometric distortion in the radar image data for a multistatic radar system. To remove the skew in this data by properly formatting and processing.

The unique and proprietary technique developed by Airborne Instruments Laboratory (AIL) will be refined and applied to the general bistatic high resolution (stretch data) wherein the target, transmitter and receiver are not all in the same plane. The method of solution will be an extension of the coherent unskewing and reconstitution logic (CURL) developed by AIL for the planar case. This technique will format the data such that the two-dimensional Fourier transform will produce a focused image for the baseline geometry.

SUPPORTED BY U.S. Dept. of Defense, Air Force, Rome Air Development Center

4.0019, SYNTHESIS AND CHARACTERIZATION OF TRANSITION METAL COMPLEX SYSTEMS WITH NOVEL SOLID STATE PROPERTIES
L.V. Interrante, General Electric Co., General Electric Research & Development Center, *1 River Rd., Schenectady, New York* 12305 (DF054590; F49620-79-C-0051)

AF function - future Air Force flight operations require improved electromagnetic devices for use in flight control, reconnaissance and surveillance, signal processing and control, and environmental support. Deficiency - a need exists for new materials which can be exploited for the design of new concepts and classes of electronic and magnetic devices. Objective - to obtain the understanding and predictive capability necessary for effective utilization of the unique features of existing transition metal complexes in solid-state applications and to permit purposeful synthesis of new materials for satisfying the requirements. How work contributes - new electromagnetic materials will be synthesized and their properties identified.

The research focuses on the synthesis and characterization of new solid state materials containing planar transition metal complexes. The primary objectives are: 1) to elucidate synthetically useful structure-property relationships that ultimately will enable the directed synthesis of materials with desired solid state properties, and 2) to synthesize and characterize new materials with novel and useful electrical and/or magnetic properties.

SUPPORTED BY U.S. Dept. of Defense, Air Force, Office of Scientific Research

4.0020, DESIGN GUIDELINES & OPTIMIZATION PROCEDURES FOR SUBSYSTEMS

W. Monsen, Grumman Aerospace Corp., *S. Oyster Bay Rd., Bethpage, New York* 11714 (DF912180; F30602-78-C-0167)

A need exists for the development of systematic methodologies and procedures for the design of built-in test diagnostic subsystems. Such techniques should take into account the reliability characteristics of each isolatable module, the total proportion of equipment faults that the built-in test subsystem will recognize, the life-cycle costs (production, operating & support) associated with the diagnosis and isolation of each module failure, false alarm characteristics associated with each diagnostic plan and impact on equipment maintainability. All of the above should guide not only the choice of the diagnostic subsystem, but indicate just how the subsystem should be designed. What is needed are optimization tools, and algorithms which can be used during design to aid in forming the most efficient design configuration. Preliminary efforts in this area were pursued in-house and were included in MIL-STD-1591 (Analysis/Synthesis of on Aircraft Fault Diagnosis Subsystems).

The approach will involve relating such things as intended depth of BIT diagnosis and isolation, the proportion of total faults that the BIT is capable of detecting and diagnosing, false alarm characteristics and effects, the cost impacts (on life cycle-cost) of the BIT, and developing an optimized approach to the incorporation of BIT in a dependent equipment or system.

SUPPORTED BY U.S. Dept. of Defense, Air Force, Rome Air Development Center

4.0021, STATISTICAL INFORMATION PROCESSING TECHNIQUES FOR REMOTE SENSING DATA

D. Kazakos, State University of New York, Buffalo Campus, School of Engineering & Applied Science, Dept. of Engineering, *3435 Main St., Buffalo, New York* 14214 (ENG76-20295)

The problem of reduction of remotely sensed data with concurrent preservation of the interesting information is one of the main themes of this research plus developing computationally simple performance bound and of exploiting them for data reduction. Increased exploitation of the statistical structure of the data is advocated, which ordinarily would cause increased storage and computational load. The simultaneous consideration of data reduction algorithms and computationally simple performance bounds will alleviate this problem. Therefore, improved performance using the same computer resources will be the overall result of the research. The methods, when fully developed, will greatly enhance the operational capabilities of present and future remote sensing systems with automated data processing.

SUPPORTED BY U.S. National Science Foundation, Directorate for Engineering & Applied Science

4.0022, RADIATIVE ENERGY TRANSFER IN GASES

R.D. Cess, State University of New York, Stony Brook Campus, School of Engineering & Applied Science, Dept. of Mechanical Engineering, *Stony Brook, New York* 11794 (ENG76-82547 A01)

This research program concerns radiative energy transfer in gases, and involves the incorporation of radiative parameterizations into simple climate models, in order to estimate the sensitivity of the earth-atmosphere system to either man-made or natural climate perturbations; the inclusion of wind-blown dust into infrared radiative transfer formulations for the earth's atmosphere; an investigation into possible negative feedback mechanisms which might modify the projected global climate change resulting from the enhancement in atmospheric carbon dioxide through the burning of fossil fuels; and the development of an atmospheric radiation model for Saturn, with the goal towards producing a thermal structure model which is consistent with ground-based infrared emission observations.

This is a continuation of NSF Grant No. ENG-7204175 AO1.

SUPPORTED BY U.S. National Science Foundation, Directorate for Engineering & Applied Science, Div. of Civil & Mechanical Engineering

4.0023, OPERATIONAL RELIABILITY EXPERIENCE TO IMPROVE RELIABILITY OF AF ELECTRONIC SYSTEMS

E. Florentino, U.S. Dept. of Defense, Air Force, Rome Air Development Center, *Griffiss Air Force Base, Rome, New York* 13441 (DF707570)

This in-house effort will be concerned with (a) the collection from all Air Force data sources of information on the reliability of Air Force electronic comunication, command and control, surveillance, navigation, and display equipment; and (b) analysis of these data to determine the present field reliability of these items and comparison of predicted, measured, and observed field failures.

The field failure data collected will be analyzed to define the scope and impact on the reliability problem. Principal 'contributors' such as parts, equipment design, and human influences will be investigated. The influence of major offenders or 'weak links' in the system will be defined. Effects of equipment characteristics such as power output, complexity, and other factors on reliability will be determined. Reports on the above information will be published and disseminated to interested personnel.

SUPPORTED BY U.S. Dept. of Defense, Air Force, Rome Air Development Center

4.0024, FUEL CHARACTER EFFECTS ON J-79 SMOKELESS COMBUSTOR

C. Gleason, General Electric Co., *1 Jimson Rd., Cincinnati, Ohio* 45215 (DF463590; F33615-79-C-2033)

Determine the effects of fuel characteristics (hydrogen content, end point, viscosity, aromatics types) on a lean primary zone, J-79 combustor. Compare results with similar data for a rich primary zone J-79 combustor. Determine if the lean primary zone combustor is more fuel tolerant than the rich primary zone combustor.

Through a sole-source contract to General Electric Co., perform tests on the smokeless combustor (lean primary zone) developed for the J-79. Both JP-4 and JP-8 are to be baseline fuels. Vary fuel hydrogen content, distillation end point, aromatics types and concentrations. Compare test results with similar data already obtained for rich primary zone combustor.

SUPPORTED BY U.S. Dept. of Defense, Air Force, Aero Propulsion Lab.

4.0025, LONG BONE AND JOINT RESPONSE TO MECHANICAL LOADING

A.E. Engin, Ohio State University, Columbus Campus, School of Engineering, Dept. of Engineering Mechanics, *190 N. Oval Dr., Columbus, Ohio* 43210 (DF055540; F49620-79-C-0110)

AF function- the Air Force operational environment involves exposures to a wide variety of mechanical forces which included flail and impact. These forces are of special significance in relation to the incidence of ejection from high performance aircraft where the probability of disabling injury is unacceptably high. Despite design improvements on ejection seats, dislodging of the limbs occur frequently when the body is ejected into the windblast. The resulting 'flail injuries' are the dislocation of major articulating joints and various long bone injuries. Deficiency - abandoning disabled aircraft may be accomplished by either bailing out via seat ejection, or by the ejection of the encapsulated crew station containing one or more aircrew members. if separation from the disabled aircraft occurs by seat ejection, the body of the ejected crew member is subjected to a high speed air stream (windblast) generating large magnitudes of aerodynamic forces on the higher and lower extremities of the body. Objective - this research proposes a comprehensive program dealing with the biomechanics of the major articulating joints and long bones by considering the response of these joints and bones to both static and dynamic loads. Data collected from such a research program will be invaluable in understanding the flail injuries on a biomechanical basis and will provide the corner stone toward the establishment of preventive measures. How research contributes - this research will directly support Ro 1.7.1, 'Criteria for Limb Flail Injury Prevention.'

This proposal presents a comprehensive research program to study the biomechanics of flail injuries. The proposed research is divided into four phases. Phase I involves the collec-

tion of active muscle force data during simulation of windblast forces on the higher and lower extremities of the body. Phase II is concerned with quasi-static testing of the major articulating joints of cadavers in force ranges much beyond the tolerable levels by human subjects. The dynamic testing of the same joints under various impulsive load profiles will be carried out in Phase III. In the last phase of the program the fracture of long bones and dislocations of the joints will be investigated under both static and dynamic loading conditions by means of simulating as nearly as possible the appropriate mechanisms of injury. (Text Abridged)

SUPPORTED BY U.S. Dept. of Defense, Air Force, Office of Scientific Research

4.0026, FINITE STATE MODELS OF MANNED SYSTEMS - VALIDATION, SIMPLIFICATION, AND EXTENSION

R.A. Miller, Ohio State University, Columbus Campus, School of Engineering, Dept. of Industrial & Systems Engineering, *190 N. Oval Dr., Columbus, Ohio* 43210 (DF054000; AFOSR-79-0015)

AF function - Air Force operations involve a multitude of control related information processing and decision-making tasks which are performed by aircrew personnel. Deficiency - this research will increase the stock of tools available to the analyst for representing and analyzing the discrete control performance of networks of human operators. It may also point the way toward much more fundamental models suitable for the prediction of inference, decision and communication performance of manned systems. Objective - the main objectives of the study are to simplify the process of discrete control model construction and to clarify the theoretical basis, both mathematical and psychological, of discrete control modelling. Existing discrete control data bases will be used for this study. How research contributes - this research is a unique attempt to analyze discrete control decisions of the human operator in a weapon systems context. It is a direct step toward improved ability to predict manned system performance.

The proposed research will involve 1) an assessment of the robustness of previously developed discrete control models, 2) design and implementation of computer-aided procedures for the construction and identification of discrete control models of manned systems, and 3) some preliminary theoretical work on the feasibility of constructing heterarchical information processing systems to represent discrete control tasks, particularly networks consisting of manned systems.

SUPPORTED BY U.S. Dept. of Defense, Air Force, Office of Scientific Research

4.0027, THERMAL ENERGY STORAGE/HEAT TRANSFER RESEARCH

T. Mahefkey, U.S. Dept. of Defense, Air Force, Aero Propulsion Lab., *Wright Patterson A.F.B., Dayton, Ohio* 45433 (DF463170)

Conduct basic research on thermal energy storage and heat transfer as applied to Air Force spacecraft and aircraft power and thermal control subsystems. Initial phases of the research will center on thermophysical characterization and corrosion studies of integral heat pipe/thermal storage units, and analysis of their dynamic charge/discharge behavior.

Apparatus to process and deprocess file test liquid metal heat pipes will be purchased and assembled. Corrosion studies on S.S. and inconel 617 clad Na heat pipes will be conducted. Heat transfer modeling of O2 sorption systems will be initiated with appropriate subscale experimental investigations conducted concurrently.

SUPPORTED BY U.S. Dept. of Defense, Air Force, Aero Propulsion Lab.

4.0028, THEORY AND COMPUTER CODES FOR NON-EQUILIBRIUM PLASMAS

M. Stamm, U.S. Dept. of Defense, Air Force, Aero Propulsion Lab., *Wright Patterson A.F.B., Dayton, Ohio* 45433 (DF458820)

AF function - power, weaponry, communication, tracking and navigation. Deficiency - lack of knowledge of plasma interaction processes in MHD generators, gas discharges and lasers. Research -theoretical description of interaction processes in non-equilibrium plasmas. How research contributes - improved power systems, enhanced laser performance (quality, power, stability, lifetime). Valuable information on sheath development, pumping rates, laser gain, and plasma stability will be made accessible in terms of experimentally variable quantities.

Three different, yet coupled, aspects of non-equilibrium plasmas control their operation and govern their performance characteristics: (1) the electron energy distribution, (2) molecular kinetics, (3) plasma chemistry. A self-consistent theoretical investigation of plasma interaction processes is undertaken. The collisional Boltzmann equation is numerically solved to yield the electron energy distribution as a function of electric field, neutral number density, electron density, and species concentration. Molecular kinetics and plasma chemistry are consistently coupled into the calculation.

SUPPORTED BY U.S. Dept. of Defense, Air Force, Aero Propulsion Lab.

4.0029, FRACTURE BEHAVIOR OF BORON ALUMINUM COMPOSITES AT ROOM AND ELEVATED TEMPERATURES

J. Awerbuch, Drexel University, School of Engineering, Dept. of Mechanical Engineering, *32nd & Chestnut Sts., Philadelphia, Pennsylvania* 19104 (DF054720; AFOSR-79-0079)

AF function - aerospace vehicle structure and propulsion system structure. Deficiency/opportunity - improved performance and durability in hostile environments requires advanced structural materials. Rational use of these materials demands understanding of their properties. Objective - to understand the fracture behavior of boron-aluminum composites at room and elevated temperatures. How work contributes -provides essential knowledge which will allow the benefits of metal-matrix composites (high stiffness and strength, low weight, low thermal expansion, high temperature/severe environment stability) to be applied to aerospace systems.

A combined experimental and analytical effort, with concentration on crack tip damage zones, damage growth and failure modes as well as on material characterization in terms of fracture strength and microstructural properties. B-Al (5.6 MIL, 6061-F) will be tested at room temperature and at 700 degrees F with a carefully selected range of flaw sizes and laminate orientations. Near-tip crack opening displacement will be measured using an interferometric displacement gage. Damage and flaw growth will be monitored by acoustic NDE methods and studied in detail by radiography, SEM, visible light photomicrography and other methods. Results will be correlated by LEFM and energy release rate analyses. Applicability of present theoretical results will be assessed.

4.0030, MICROBIAL METHANE FERMENTATION KINETICS FOR TOXICANT EXPOSURE

G.F. Parkin, Drexel University, School of Engineering, Dept. of Civil Engineering, *32nd & Chestnut Sts., Philadelphia, Pennsylvania* 19104 (DF056230; F49620-79-C-0190)

AF function - the Air Force uses large amounts of missile and jet fuels in routine operations. The toxicants proposed for study are those commonly found in AF industrial operations and are the main cause of digestor disruption at base sewage treatment plants. Deficiency - a lack of understanding of the effect of toxic substances on anaerobic methane bacteria has limited the use of microbial processes to solve pollution problems while generating energy in the form of methane gas. Objective - the objective of this study is to generate fundamental kinetic data from laboratory experiments to be used in developing a dynamic model to describe the response of methane fermentation systems to exposure to toxicants. How research contributes - this research will provide fundamental data on the effects of AF utilized chemicals on methane bacterial kinetics. Knowledge of the effects of such toxicants on anaerobic microbial processes will result in more effective use of an energy conserving procedure for disposal of AF generated pollutants.

Methane bacteria developed on an acetate-nutrient salt substrate will be used to study the effect of toxicant concentration,

acclimation, and temperature on monod kinetic coefficients. Both batch and continuous feed modes will be used to generate the kinetic coefficients. Representative toxicants to be studied are calcium, cadmium, nickel, chromium (VI), a cationic detergent, trichloroethylene, chloroform, ethyl benzene, gasoline, jet fuel (JP4) sulfide and hydrazine.

4.0031, PROPULSION INDUCED AERODYNAMICS OF V/STOL IN TRANSITION/STO

T.D. Beatty, Vought Corp., *P.O. Box 5907, Dallas, Texas* 75222 (DN081103; N62269-78-C-0036)

Development of a methodology for prediciton of propulsion induced aerodynamics of multi jet V/STOL aircraft in transition/STO flight regime. This contract supports work unit ZA601, Agency Accession No DN681080.

Advanced development of computerized prediction technique for V/STOL aerodynamics will be accomplished. An improved vortex and entrainment model will be incorporated together with a method to account for jet wake separation. An image system for ground effect will be modified to permit calcultions throughout the STO flight regime. Correlation of prediction with experiment will be accomplished.
